b. 1 Cor 15:23–28. As in 1 Thessalonians 4, Paul argues from Christ's resurrection to the Christians' resurrection at the time of the parousia. Verses 23–28 describe events leading to the parousia and resurrection, employing language from a royal Psalm (Ps 110:1) and from two biblical texts that speak of "son of man," namely, Dan 7:14 and Ps 8:7 (cf. the conflation of Ps 110:1 and Dan 7:14 in Mark 14:62). Until the parousia, Christ is occupied with the destruction of "every rule *(archē)* and every authority (*exousia;* cf. Matt 28:16) and power *(dynamis).*" When he has finished this, Christ will deliver the kingdom *(basileia)* to God. The vocabulary is Daniel's with *dynamis* paralleled in Mark 13:26. Paul's special nuance is to interpret the Danielic nouns to refer to angelic powers (cf. Matt 24:29). He develops this theme first in the words of Ps 110:1; the resurrected Christ is in the process of placing "all his enemies under his feet." Then he brings in language parallel to Ps 8:7. The reigning Christ is "subjecting all things under his feet" (cf. Eph 1:21–22)—something the psalmist attributes to "man" and "the son of man," whom God has crowned with honor and glory. Different from Daniel 7, the enthronement here envisioned is temporary; final kingly rule will belong to God. The language of v 24 suggests the reversal of Dan 7:14; the enthroned Jesus will give back what was given to the son of man. Also different from Daniel 7, but like *1 Enoch,* the judicial function of subduing of evil powers is attributed to the exalted one and does not occur before his enthronement. The subduing of death, i.e., Jesus' association with the final resurrection, parallels 1 Thess 4:14–16, as well as *1 Enoch* 51 and 62. That God is here called "Father" (v 24) is consonant with the gospel son of man traditions that speak of God in these terms. In his argument about the resurrection body (vv 35–44), Paul's reference to "sowing" and "raising" parallels *1 Enoch* 62:8.

c. Other Pauline Texts about Jesus the Judge. 1 Cor 3:10–14; 4:1–5 emphasize that Paul and Apollos will be judged for their ministry. The first passage, with its reference to judgment by fire, reflects a Jewish judgment tradition like that in *Testament of Abraham* 12–13. The references to revelation and disclosure, not specifically found in the *Testament of Abraham,* are picked up again in 4:1–5, which has some remarkable terminological parallels with Luke 12:2–9, 39–46 = Matt 10:26–32; 24:42–51, where the relevant language is related to judgment and appears in the context of sayings about the son of man.

2 Cor 5:10 explicitly asserts the judicial functions of Christ, before *(emprosthen)* whose tribunal *(bēma)* all must appear to receive what they deserve for their good and evil deeds. The passage provides a context for Rom 2:1–16, which emphasizes that God is the righteous judge of human deeds and the secrets of the heart (v 16; cf. 1 Cor 4:5), but indicates that Jesus will be the agent of that judgment (v 16).

d. 2 Thess 2:1–12. This Pauline or Deutero-Pauline text about the parousia of "our Lord Jesus Christ," like its counterpart in 1 Thessalonians 4–5, employs the Synoptic tradition known from Mark 13. Here the transcendent messiah is depicted like the Man from the Sea in *4 Ezra* 13. In a formulation unique to this passage, the fiery blast from his mouth destroys the man of lawlessness, a satanic incarnation whose claims to deity recall texts about rebel kings in Isaiah 14 and Ezekiel 28, and whose performance of signs and wonders is paralleled in the descriptions of the false prophets in Mark 13. A similar confrontation is described in the latter chapters of Revelation (see below).

e. Heb 2:5–9. In this text and its context, the author reinterprets the exposition of Ps 8:7 in 1 Corinthians 15. Nothing is excepted from Jesus' authority (2:8; contrast 1 Cor 15:27). Whether this author believes that this authority is already in place for the exalted Christ is not clear. The "not yet" of the tradition, different from 1 Corinthians 15, refers to the incarnation and the passion of the preexistent Jesus, who "for a little while" was made lower than the angels, but whom God has seated at his right hand (Ps 110:1), crowned with honor and glory, and set over all things. Hebrews is remarkable both for its agreements with and differences from the Synoptic tradition. Son of man designates the human existence of the preexistent Wisdom, who is also son of God (1:1–4), but the author never refers to the coming judge as such.

7. The Book of Revelation. The risen and exalted Jesus, who dominates the action in this apocalypse, is a composite figure who parallels the Chosen One in the Parables of Enoch and the Man from the Sea in *4 Ezra* 13 and draws on the same biblical traditions that underlie the two Jewish texts.

In 1:7 he is presented in the imagery of Dan 7:14, but it is immediately clear that the glorious one who will come with the clouds is the persecuted one who will be seen by his enemies. The idea is conveyed through the language of Zech 12:10, which is used both at the conclusion of John's passion narrative and in the Matthean elaboration of Mark's description of the son of man's parousia (Matt 24:30 = Mark 13:26; cf. *Ep. Barn.* 7:9–10).

Although the description of the risen one in 1:12–16 recalls the angel in Daniel 10, the analogy, "one like a son of man" (v 13) suggests the figure in Dan 7:13. Elements in the letters that he dictates draw on traditional messianic language and Synoptic son of man traditions. The sword that issues from his mouth (1:16, 2:12, 16) is an element drawn from Isa 11:4 which recurs in *1 Enoch* 62:2 and *4 Ezra* 13:4, 10–11. His status as the son of God who will rule the nations with a rod of iron (2:18, 27) is also messianic, and the language derives from Ps 2:7–8, a text used in *1 Enoch* 48, Wisdom 2 and 5, and *4 Ezra* 13.

The letter to Sardis draws on the Synoptic tradition that compares the Day of the son of man to a thief (3:3; Matt 24:43–44 = Luke 12:39–40; cf. 1 Thess 5:1–7), and Rev 3:5, 8 reflect elements of both the Matthean and Lukan wording of the Q tradition about confessing and denying (Matt 10:32–33; Luke 12:8–9).

The scene in chap. 5 is a reshaping of Dan 7:13–14, with some remarkable differences. The Lion of Judah (5:5) recalls the Davidic messiah of *4 Ezra* 12, but he is quickly defined as the Lamb who was slain (5:6, 12). Although much debate has centered on the meaning of this image and its parallel in John 1:29, an appeal to Isa 53:7, 11 is supported by the traditional conflation of son of man, messianic, and servant language in the Jewish and Christian texts already cited. The lamb stands before God's throne as the Chosen One does in *1 Enoch* 49:2 (cf. Wis 5:1; Acts 7:55). According to 5:7–12, the taking of the scroll from God's right hand (cf. Ps 110:1) is related to the Lamb's receiving of power, might, honor, and glory (cf. Dan 7:14). Hereafter one hears about "him who sits on the throne and the Lamb" (5:13; 6:16; 7:9, etc.). Thus, the Lamb's relationship to God parallels that of the Lord of Spirits and the Chosen One in *1 Enoch* and God and God's anointed in Psalm 2.

Reference to the royal psalm recurs in 11:15, 18; 12:5, 10, although the last verse associates with God and his anointed one the power, kingdom, and authority which are delegated to the one like a son of man in Daniel 7.

Revelation 13 returns to Daniel 7 and the beast who rises from the sea, but the opponent of the two beasts of chap. 13 is the Lamb on Mt. Zion, the son of God—the Lord's anointed mentioned in Ps 2 and also placed on Mt. Zion in *4 Ezra* 13. Jesus' messianic status is again explicit in the vision in 19:11–21, where the imagery of Psalm 2 and Isaiah 11 recurs. He is seated, not on a throne, but on a horse, ready for battle against the kings of the earth. Functionally, this is the equivalent of the Parables' description of the Chosen One, who is seated on the throne of glory in order to judge the kings and the mighty (also a cliché in Revelation).

According to Revelation 20, Christ and those beheaded for the testimony of Jesus and for the word of God (cf. "for me and the gospel … me and my words," Mark 8:35, 38) will be enthroned with Christ for a thousand years, after which the judgment will take place in a court that is described like the tribunal in Dan 7:10. The book concludes with the promise with which it began: the exalted one is coming to commence the events already described (22:20).

Much more than any of the other NT texts, Revelation emphasizes Jesus' functions as ruler (whether in the present, in the millennium, or afterward), and in this sense John returns to Daniel 7. Nonetheless, the Jewish and early Christian developments of the tradition are evident in the importance that John assigns to the coming judgment as the resolution of the present crisis, and in the judicial functions that he ascribes to the exalted Jesus.

8. 2 Peter. Belief and disbelief in the parousia of Jesus is a central problem in this text. In 1:16–21, the guarantee of this parousia is the glorious vision which the Synoptics describe as a transfiguration. Here

Peter seems to depict the event as the postresurrection exaltation of the son of man; Jesus "received honor and glory" (cf. Rev 5:12). A divine oracle "from heaven" announcing Jesus as "my son" and the location of the event on "the holy mountain" recall motifs from Ps 2:4, 6, 7. 2 Peter 2 alludes to the Enochic story of the rebel angels and the flood/final judgment typology (cf. 3:5–7), and the successive references to Noah and the Flood and Lot and Sodom recall Luke's version of the Q saying about the days of Noah and the day of the son of man. The reference to the sudden appearance of that day (3:10) reflects the Synoptic saying about the thief, also cited in 1 Thessalonians 5 and Revelation 3. Knowledge of the context of the son of man saying in Mark 13 may be indicated in chaps. 2 and 3, in the warnings about false teachers and prophets in the last times, and in 3:5–7, which appears to know the logion in Mark 13:31.

9. Summary of NT Evidence. In a wide variety of ways, NT texts evidence knowledge of the forms, themes, and conflations in Jewish traditions about the son of man. Often taken for granted is the Jewish interpretation that identified the heavenly figure in Daniel 7 as God's anointed one and, sometimes, God's servant. The gospels usually echo the language of Daniel rather than *1 Enoch,* although occasionally the Enochic form of the text is especially evident (e.g., Matthew 25). Outside of the gospels, one finds in many places the belief in an eschatological parousia of the transcendental messiah, which is most probably traceable to a conflate tradition from which the Danielic and Enochic term "son of man" has disappeared.

Perhaps the most remarkable fact about the NT son of man traditions is their consistent ascription of judicial functions to the exalted Jesus. In spite of the frequent use of Danielic language and imagery, these texts, with the exception of Revelation, do not emphasize the Danielic motif of "kingship," much less an eternal reign. Constitutive and central is Jesus' role as judge (or, occasionally, witness), an element introduced into the tradition from non-Danielic, albeit royally oriented sources. This judicial element, more than any other, identifies the NT texts as derivative from the conflated Jewish traditions.

Most of the gospel texts about the exalted eschatological son of man presume that this figure is identical with the risen and exalted Jesus. Reference to the earthly Jesus as "son of man" reflects a complex process of speculation. The Wisdom-*1 Enoch* parallels, and perhaps the identification of Enoch as son of man, allowed one to find for the future son of man and exalted servant an earthly existence as the persecuted one. By the same token, the Enochic idea that the future son of man/Chosen One had an existence before creation allowed Christians—different from the author of the Parables—to posit the descent, suffering, and death of the preexistent son of man. This viewpoint was further facilitated by other Christian speculation about Jesus as the incarnation of heavenly Wisdom. The complexity of these speculations is further attested in Phil 2:6–11, which imposes the myth of descending and reascending Wisdom (cf. *1 Enoch* 42) on the story of the suffering and exalted servant of the Lord.

These complexities in early Christian speculations about Jesus are consonant with the manner in which Jewish traditions had already spun out many variations, reinterpretations, and conflations of basic texts, themes, and mythic patterns. The early Church's constitutive faith in the resurrected and exalted Christ led its teachers to conflate further what they saw to be compatible traditions in their Jewish heritage. Of this process of developing christology, we have only remnants and hints. Attempts to reconstruct this history must consider the possible extent to which the origins of Jesus' identity as "the Christ" may have been influenced by the traditions about a transcendent son of man-servant-messiah described above, which would have functioned as an interpretation of the Easter experience in the primitive Church.

10. The Historical Jesus and the Son of Man. For all of the reasons developed and reiterated by modern NT scholarship, we can never be certain whether and to what extent Jesus of Nazareth made reference to "the son of man." Nevertheless, several observations follow from the present exposition:

a. Some of the traditions about the exalted son of man found in Q and Mark seem to be attested very early in Paul.

b. With a few exceptions, gospel traditions about the exalted son of man assume, in their present context, an identification with the risen Jesus.

c. Texts that describe the opposition to Jesus (whether the rejection of his message or his condemnation to death) with reference to the son of man indicate that the variants of the tradition now found in Wisdom

2 and 5 and the Parables of Enoch were being read in light of one another. The suffering righteous one will be exalted as unique son of man; the son of man had an earthly existence that was characterized by rejection and that culminated in violent death.

d. In the light of this clear tendency to identify the son of man with Jesus, one must consider carefully whether texts like C.1.a, b and possibly C.2.a.3 may be traced back to Jesus. The fact that the last of these assumes an identification with Jesus in its Markan context and that Paul reads all of these as references to Jesus should not obscure the fact that in no case does the gospel form of the saying itself necessitate such an identification. This is in striking contrast to those sayings which clearly refer to the rejection or death of Jesus the son of man, to the church's persecution for his sake, or, probably, to the apostles' future association with the glorified son of man.

e. It is far more problematic to maintain that any of the sayings which identify Jesus as the son of man are genuine sayings of Jesus. To accept them as genuine more or less in their present form, one must posit that Jesus cast himself in the role of the suffering prophet or sage and, more important, that he believed that his vindication from death would result in his exaltation to the unique role of eschatological judge. Alternatively, one could expunge the term "son of man" as a secondary Christian interpretation of a genuine saying in which Jesus cast himself in the role of a rejected and suffering servant who anticipated vindication. Such a self-understanding is evident in a number of Qumran hymns ascribed to the Teacher of Righteousness, but neither in these hymns nor in this hypothetical interpretation of the gospel logia does the speaker anticipate for himself the unique eschatological status attributed to the central figures in the Parables of Enoch and *4 Ezra.*

A. Introduction
   1. Title
   2. Canonicity
   3. Authorship and Date
   4. ANE Love Poetry
B. Interpretation
   1. Language and Literary Form
   2. Structure and Unity
   3. Levels of Meaning
C. History of Interpretation

_____

A. Introduction

1. Title. The title is taken from the editorial superscription in 1:1, *šîr haššîrîm.* The duplication is Hebrew idiom for the superlative: the greatest song (cf. "King of Kings"). It is also known as the "Song of Solomon" in the tradition of English versions, and "Canticle" or "Canticle of Canticles," following the Vulgate *(Canticum Canticorum).* Its position in the Bible has varied. It comes after Job in the Hebrew Bible, and it is the first of the five "Scrolls" *(mĕgillôt),* where it is designated for the Passover reading. In the Greek and Latin tradition it comes after Ecclesiastes. It is often associated with Proverbs and Ecclesiastes, among the "books of Solomon."

2. Canonicity. The book is accepted as part of the Bible in both the Jewish and Christian traditions. It is not possible to discern the reason for its inclusion in the biblical canon, or when the decision was finally made. Solomonic authorship and a religious interpretation of the book are commonly alleged as reasons, but these are not conclusive. At an early date doubt was expressed about the work. In the time of the great rabbi Akiba (died about A.D. 135) a question arose whether it "defiled the hands," i.e., was canonical. He is recorded as saying that the whole world was not worth the day on which the Song was given to Israel (*m. Yad.* 3.5). Except for aberrant instances, no real opposition to the canonical standing of the book has been voiced.

3. Authorship and Date. The first verse ("the Song of Songs which [is] 'to' Solomon") has usually been interpreted as indicating Solomonic authorship. That may well be the editor's intent for the preposition "to," but of itself the preposition can suggest other meanings such as subject matter (about), or possession (belonging to). The association of the Song with Solomon is due to the mention of his name six times (1:5; 3:7, 9, 11; 8:11–12), as well as references to a "king" (1:4, 12; 7:6). In none of these instances does "Solomon" speak; all the references are in the third person, except for a vocative, "O Solomon," in 8:11. None of the passages demands Solomonic authorship. It must be admitted that no one has identified the author(s).

By the same token the date of the work cannot be ascertained. Dates before and after the Exile have been proposed, but none has established itself. As M. Pope (*Song of Songs* AB, 27) has remarked, "The dating game as played with biblical books like Job and the Song of Songs, as well as with many of the Psalms, remains imprecise and the score is difficult to compute. There are grounds for both the oldest and the youngest estimates." The tendency of modern scholarship has been to assign a postexilic date. But the arguments, based primarily on language, are fragile. The appearance of a Persian word, *pardēs,* in 4:13, can be balanced against ›*appiryôn* (perhaps of Gk derivation, *phoreion*) in 3:9). No solid inference can be drawn from the appearance of alleged "Aramaisms," or of "archaic survivals" (Albright 1963).

Pertinent to the question of the dating is the unity (see below) of the work. It is conceivable that several poems within the eight chapters were written by different hands at various times, and only later were assembled into the present form of the book. But this is also a matter of conjecture.

4. ANE Love Poetry. Although love poetry has flourished in all cultures and ages, it is the literatures of ancient Mesopotamia and Egypt which are most pertinent for comparison with the Song of Songs.

For the most part the Mesopotamian poetry deals with divine love between gods and goddesses. In his study of the ancient Sumerian texts S. N. Kramer (1969) has pointed out such similarities as the portrayal of the male as shepherd and king, while the woman is both bride and sister. In a poem to Shu-Sin (who has the role of the god, Dumuzi) the woman hails the king as the "brother," who provides life and abundance (*ANET,* 644–45). King Shulgi invites his "sister," Inanna in the following words: "I would go with you to my field … I would go with you to my garden" (Kramer 1969:100). Thus, some themes which occur in the poems relating to sacred marriage are also reflected in the Song. This is to be expected. There will always be commonplaces in love language, whether one is speaking of deities or of humans. But there is no sure way of detecting the direction of the influence (e.g., that the love life of the divinities provided motifs for the expression of human love). It seems probable that there was mutual influence.

Only a few texts deal with love between humans. The most pertinent is a dialogue between a man and woman (Held 1961). It reflects a broken love affair, and a reunion. The similarity to the Song lies in the love experience itself; searching for the lover, and enjoying the lover's favors.

The love poetry of ancient Egypt presents impressive parallels to the Song. See also EGYPTIAN LITERATURE (LOVE SONGS). There are four substantial collections, all dating from about the 14th–12th centuries B.C. (*AEL* 2:181–93; Fox 1985:3–81). They differ from the Song in that they present no dialogue between lover and beloved. They are rather soliloquies (and here they resemble the Song; cf. 2:8–17) by the man or by the woman. The woman addresses the man in the second person and sometimes in the third person (cf. Cant 1:2–4). The woman is described as "sister" (Cant 4:9–12; 5:2) and the man is called "brother" (never in the Song, but cf. 8:1). The collections manifest the same literary genres as are found in the Song: poems of admiration, yearning, description of physical charms, boasting, etc. (White 1978:150–53). In both literatures the senses are deeply involved: touching, seeing, hearing, smelling (fragrance). Compliments, sometimes extravagant, abound. The beloved is most beautiful, unique, as in the Song (1:8; 6:9). The atmosphere in both the Egyptian and the Israelite poems is remarkably similar.

Other parallels between the love poetry of various ages and cultures have been pointed out (Robert 1963:329–426). The similarities to the Song are evidence of the common experience of love, not of mutual influence.

B. Interpretation

1. Language and Literary Form. Considering the length of the Song, there is an extraordinary number of *hapax legomena,* and some defy translation, such as *talpiyyôt* (4:4), *taltallîm* (5:11), *ḥărûzîm* (1:10). Other words are rare in the Hebrew Bible, or are used differently from their normal usage elsewhere, such as *šzp* (1:6), *dgl* (cf. 2:4; 5:10; 6:4, 10), and *ḥnṭ* (2:13). In many instances the commonly received translation is uncertain, e.g. "rugged mountains" (RSV) for "mountains of *btr*." A striking grammatical peculiarity is the use of the relative particle, *še-*. Except for the title, it is used throughout the work. But no conclusion about the date can be drawn from this. It occurs as early as the song of Deborah (Judg 5:7) as well as in late biblical books.

The metaphors ("your eyes are doves," 4:1) and similes ("your hair is like a flock of goats," 4:1) are not easily understood by the modern reader. Keel (1984) wisely insists on the dynamic and cultural character of the comparisons: "eyes" are really glances; "doves" are understood as messengers of love. All kinds of animals appear: sheep, horse, stag, fox, dove, goat, fawn, lions and leopards, ewe, gazelle and hind. Memorable is the oath, "by the gazelles and hinds of the field" (2:7; 3:6). There is a profusion of fruits and flowers, many of them exotic: vineyard, henna, cedars and cypresses, lilies and thorns, apples and raisin cakes, figs and pomegranates, myrrh and aloes, nard and saffron, calamus and cinnamon, palms, herbs, mandrakes, and nut garden. The comparison of the woman to a garden in 4:12–16 is singular in that no one garden in Palestine could have harbored all these plants, many of them foreign. Another unusual characteristic is the high number of proper names: Kedar, En-gedi, Sharon, Tirzah, Lebanon, Gilead, Amana, Senir and Hermon, Heshbon and its pools, Beth-rabbim and Carmel. The exquisite literary style, decorated with a large number of hapax legomena, is perhaps easier to explain on the view that the work derives from a highly educated author(s). But standards of comparison are lacking; we have no established "folk poetry" in the Bible which can be compared with the Song.

The literary form of the Song can be considered from two points of view. What is the genre of the book as it stands, and what subgenres can be found in it? The answer to the first question is hard to determine. Is the Song more than a collection of poems? Is it a work that has been given a certain unity and message by its structure (see the treatment of unity and structure below)? Or is it a haphazard anthology of poems, as 8:6–7, 8–10, 11–12, 13–14 might suggest? An overall designation of the genre of the book does not seem possible. The most neutral designation might be "love song." Even here the term "song" should not be pressed. It is reasonable to suppose that there were love songs in ancient Israel. The references in Jer 7:34; 16:9; 25:10; 33:11 to the "voice of the bridegroom and the voice of the bride" are probably to wedding songs. It is surely possible that some wedding songs are preserved in the Canticle, but we cannot prove this. As the work stands, it is a poem to be read rather than a song to be sung, despite the title (1:1) which gives it the unity of *one* Song.

The subgenres within the Song can be established with some success (Murphy 1981b). Modern scholarship has been able to characterize the following types: yearning (e.g., 1:2–4), admiration (e.g., 1:12–14), reminiscence (e.g., 2:8–17), *waṣf* (a description of the physical charms of the beloved, e.g., 4:1–7), boasting (e.g., 8:11–12), teasing (e.g., 2:14–15), and self-description (e.g., 1:5–6).

The interpretation of the Song as a *drama* is an attempt to provide a higher unity for these various types of poems. Origen (d. 253) was the first to use the word drama, and he also distinguished between several speakers, or *dramatis personae.* But it was not until modern times that this approach to the Song took hold (Ewald 1826; Delitzsch 1891; Pouget and Guitton 1948). Perhaps the most telling argument against the theory is that none of the proponents agrees with the other. In some instances the text has to be rearranged in order to suit the theory, and in all cases the interpreter has to supply very subjective "stage directions." Again, there is a difference even in the identification of the main characters. According to Delitzsch there are two main characters, Solomon and a shepherd girl, the Shulammite (7:1). The drama deals with the development of their love, how Solomon takes her to Jerusalem, and how his love for her is ennobled. But the interpretation by Ewald recognizes three main characters. King Solomon and a shepherd are suing for the hand of the Shulammite. She ultimately remains faithful to her rustic lover and rejects the royal blandishments of Solomon (8:11–12). Moreover, the conflict and plot development that are characteristic of drama are not evident in the Song. One may agree that the Song is dramatic, but it is not drama as this term is understood in our culture.

The basis for the dramatic interpretation lies in the indisputable fact that there are various speakers within the eight chapters of the Song. Due to the gender indications, there is wide agreement on whether a man or a woman is speaking. It is more difficult to determine if the male speaker is one and the same person, because two identifications are offered: a king (1:4, 12; 7:6) and also a shepherd (1:7–8). It seems better to recognize only one man, in view of the common literary fiction which endows the beloved with more than one identity (king, shepherd, etc.). The tendency is to endow the beloved with a social class above the one to which he or she actually belongs. This is the "make-believe" language of love, feeding off imagination and exemplified in love literature across the centuries, as Hermann (1959:111–24) has pointed out.

How many other speakers can be identified in the Song? The "Daughters of Jerusalem" clearly speak in 5:9 and 6:1, and they are addressed several times by the woman (2:7; 3:5; 5:8). They do not seem to be significant persons in the Song; they serve more as a foil for the woman to speak (especially 5:9; 6:1). The "brothers" of the woman are alluded to in 1:6, and the woman recalls their words of long ago in 8:8–9. The "companions" of the man are mentioned in 1:7 and 8:13, but are not further identified.

Several modern translations (NAB, NEB, NJB) have followed the practice of the ancient Greek ms, *Sinaiticus* (about A.D. 400), in which the identification of "bride" and "bridegroom" was supplied by a copyist. In the main, there is a wide consensus on the identity of the speakers (male or female), and the marginal identifications are an aid to understanding the sequence of the text. It is worth noting that more lines are to be ascribed to the woman than to the man.

Many commentators (Budde 1898; Würthwein 1969:31–33; Krinetzki 1964, but not 1980) have claimed that the original setting of the poems is a marriage celebration. But there is little in the text to sustain this.

It is clear that 3:6–11 refers to a wedding procession—of Solomon "on the day of his marriage" (3:11). But this is the only explicit reference to marriage in the entire work. Elsewhere the man refers to the woman as "sister," and "bride" (4:8–10), but these terms of endearment do not establish the setting of the poems.

Another setting has been proposed by scholars who adhere to the so-called cultic interpretation of the Song (*IB* 5:98–148). This interpretation is an hypothesis concerning the *original* meaning of the poems in their *original* liturgical setting: the sacred marriage rite, or the marriage between a god and a goddess (Haller 1940; Kramer 1969; Schmökel 1956; Waterman 1948). The arguments are by their very nature hypothetical, since so much depends on the reconstruction of the original background. Pope (*Song of Songs* AB, 145–63) presents a sympathetic and critical view of the development of this interpretation, and he is convinced that the cultic view is "best able to account for the erotic imagery" in the work (*Song of Songs* AB, 17). However, at the most this approach deals with the prehistory of the text. Even Meek explains the Song in its present form as (human) love poetry: "The transforming influence of later Yahwism has almost completely obliterated the elements of the dying and rising god, the sacred marriage, and the place of the king in the rites; but enough traces remain to show that they were once there, although long since forgotten" (*IB* 5:95). It is difficult to favor a view that does not deal with the meaning of a text as we presently have it, and insists on making the hypothetical prehistory of the text the determinant of meaning. Of itself love poetry is applicable to the human and the divine levels, and each level doubtless influences the other. But it is precarious to tie the meaning of the Song into a reconstructed history of Israelite religion.

More intriguing is the question of the setting which the poems receive by being made into a book of eight chapters and promulgated as a unit. What was the occasion and purpose of this? It has been surmised that it would have been the Hebrew sages that were responsible for the preservation and publication of the work. They would have recognized that the poems nurtured the ideals which were part of the wisdom teaching, and the attribution of "authorship" to Solomon, the wise man par excellence, gives some credence to this hypothesis (*IOTS*, 574–76; Würthwein 1969:31).

2. Structure and Unity. The content of the eight chapters emerges clearly enough from the literary forms mentioned above (yearning, admiration, etc.), and from a discussion of the structure of the work. Even though there are many unsolved problems concerning the structure and unity of the book, there seems to be a drive towards unity in the text, whether this is to be ascribed to an original author or an editor of the collection (Murphy 1977; 1979).

There is no scholarly consensus concerning the structure of the Song. As few as six poems have been suggested (Miller 1927), and some scholars have recognized as many as twenty-five or more (Landsberger 1954; Krinetzki 1980). Angénieux (1964) established eight poems on the basis of primary (e.g., 2:7) and secondary (e.g., 1:4; 2:4; etc.) refrains, but he had to resort to a hypothetical reconstruction of the text. Exum (1973) has a more sophisticated analysis which establishes eight poetic units by means of the repetition of key phrases and themes and parallelism between the poems.

For convenience the following structure is proposed as a key to understanding the coherence of the Song in its present form. These units may very well have been formed out of previous poems, but this question cannot be treated here. The key to this structure is recognition of dialogue as the dominant thread of unity. Where dialogue is interrupted, and cannot be continued in a consecutive manner, separate poems should be recognized. The structure presumes that there are only two main speakers, the man and the woman (see above the discussion of literary form).

1:2–6. Introduction. The woman expresses her yearning for her lover (who is present apparently only in spirit), and associates other women ("maidens") with herself. Her description of herself to the Daughters of Jerusalem (vv 6–7) introduces the theme of the vineyard (herself; cf. 2:15; 8:12).

1:7–2:7. A sustained dialogue between the man and the woman, in which a request for a rendezvous is answered in a teasing way by him (vv 7–8). Both continue the dialogue in terms of mutual admiration (1:9–2:7) until the woman finishes with an adjuration to the Daughters of Jerusalem (2:7, this serves as a kind of refrain; cf. 3:5; 8:4).

2:8–17. This is a reminiscence in which the woman describes a visit from her lover and his invitation to her ("Arise, my beloved, my beautiful one, and come!" 2:10). Her response closes with an inclusion (gazelle, stag, and mountains in v 17; cf. vv 8–9) as she invites him to herself.

3:1–5. The woman describes to the Daughters of Jerusalem the search for and discovery of her beloved (contrast 5:2–8). The theme of absence and presence of the lover is common in love poetry. The poem ends with the adjuration (cf. 2:7).

3:6–11. These lines end up with an address to the Daughters, but it is difficult to determine who speaks them. They describe a solemn procession of Solomon and his retinue, apparently on the day of his marriage (v 11).

4:1–5:1. The man delivers a *waṣf,* or description of the physical charms of the woman, from head to breasts, and invites her to come from Lebanon (a symbol of her inaccessibility), as he describes the ravishing effect which she has upon him (vv 1–11). He continues with the garden poem (vv 12–16) which envisions her as a paradise of exotic plants and as a sealed fountain. The last couple of lines are probably her response: "let my lover come to his garden and eat its choice fruits." In 5:1 he announces his coming to the garden (the very last line is obscure, 5:1d).

5:2–6:4. This is a dialogue between the woman and the Daughters of Jerusalem. She begins with a description of a visit from her beloved, reminiscent of 3:1–5. He disappears, but this time she cannot find him. When the Daughters ask her for a description of the man (5:9), she responds with a *waṣf* detailing his physical charms. Their interest aroused, the Daughters want to join in the search, but she replies that he has never been really lost; he has come to his garden, and they belong to each other (6:2–3).

6:5–12. The man delivers a poem in admiration of the woman, her beauty, and uniqueness. The final verses are obscure, and v 12 seems to be hopelessly corrupt.

7:1–8:4. This dialogue issues into a *waṣf* describing the woman's beauty. It begins as bystanders express an interest in gazing at her. After the description the man clearly expresses his passionate yearning for her (vv 7–10). She interrupts him in order to proclaim their unity (vv 10–11), and invites him to a rendezvous in the fields. Her declarations to him end with an adjuration to the Daughters (8:4; cf. 2:7; 3:5).

8:5–14. These verses are not united by dialogue, and have to be interpreted as separate units: vv 5, 6–7, 8–10, 11–12, 13–14. vv 6–14 have been aptly characterized as "appendices" (Robert 1963:308). The most famous lines, and apparently a high point in the poem is the woman's description of love as being as strong as death, as hard as Sheol. Just as death/Sheol pursues every living being, so does the lover pursue the beloved. In vv 8–10 the woman responds to her brothers' plans concerning her. Either the man or the woman proclaims the triumphant comparison between the woman and Solomon's vineyards (harem?). The Song ends in 8:13–14 on the mysterious note that characterizes the whole work. He asks to hear her voice, and she responds with an echo of 2:17.

3. Levels of Meaning. In a sense the interpretation has already been indicated in the analysis of the literary forms and structure given above. The Song clearly deals with sexual love between a man and a woman. There is an almost unanimous consensus among modern scholars that the literal historical meaning of the Song has to do with sexual love. This seems to be the obvious meaning of the many expressions of both physical and spiritual affection between the lovers, and should need no further proof. It is not to be described as "naturalistic" (Robert 1963:52–54) nor as "free love" (Rudolph, *KAT,* 106). Both of these terms are pejorative, and "free love" is a modern, not an Israelite idea. The Song must be appreciated simply for what it is in itself. It needs no defense for its "naturalism." It is in line with the basic affirmation of creation, especially of man and woman, as good (Genesis 1). It also harmonizes with the sages' understanding of sex as portrayed in Prov 5:15–19, and in Prov 30:18–19 ("the way of a man with a maiden," a great mystery). In the rest of the Bible marriage is usually viewed from a social point of view, the union of families and property, and the importance of descendants. In the Song sexual love is treated as a value in and for itself.

But the question can be asked whether this level of understanding exhausts the meaning of the Song. Is another meaning possible? Perhaps this question would not even be raised were it not for the striking

history of interpretation (see below) which the work has enjoyed. For centuries readers have consistently interpreted the Song in terms of divine love. What can be said about this view?

First of all, the development of modern hermeneutical theory has shown that there is no "one" meaning for a religious classic. The literal historical sense does not exhaust the meaning of a literary work. The tension between what a literary work meant "back then," and what it means "now," still remains, and the history of the interpretation of the work is a good indication of how meaning has evolved in relation to a given work. However, the historical methodology applied to biblical works cannot be dismissed. It remains all the more important, for it helps to eliminate exaggerations and vagaries of interpretation to which the text may be subjected. One must seek continuity between what the text said to its original audience and what it continues to bring to its inheritors.

Secondly, it is clear from the history of the interpretation of the Song (see below) that it has been understood as dealing with more than human love. Can one find a basis for this in the text itself? Two aspects come to mind. First there is the powerful symbol of sexual love as this has been developed within the Bible itself. The relationship between the Lord and his people was symbolized early on in terms of sexual attraction. The Lord is a "jealous God" (Exod 20:5). The covenant with Israel is not merely a legal contract. It is a covenant of love, and the prophets develop this theme to the full (Hosea 1–2; Isa 1:21; Jer 3:1; Ezekiel 16 and 23). While this theme appears more often in the context of Israel's infidelity, there are many passages which use the symbol to express fidelity (Hos 2:14–23; Isa 62:4–5). It is true that these writings explicitly identify the lovers as God and Israel, whereas in the Song there is no such indication. Yet one cannot deny the power of the symbol of sexual experience to evoke another level of meaning. It can even be said that sexual love is mentioned in the Bible more frequently in the case of the Lord and the people than in the case of human beings. As a statement on human love, the Song remains open-ended. It can be, and actually was interpreted in terms of divine love.

Perhaps there is another reason, emerging from the text of the Song (8:6):

Set me as a seal on your heart,
as a seal on your arm;
Strong as death is love,
relentless as Sheol is ardor;
Its darts are fiery darts,
the flame of Yah (8:6).

Not all translations would agree with the above (but cf. NJB). The last line is a literal translation of *sălhebetyáh* in the MT: "the flame of Yah." The term is to be interpreted as a noun to which the short form of *yhwh*, namely *yāh,* has been added. Most modern translations interpret this as a kind of superlative (a Yah flame, or an intense flame). But the above version is also possible, and it expresses a relationship between the flames of human and divine love. One cannot define this any more clearly, as though Yah were the agent or origin of the flame. But the text is susceptible to broad interpretation, even to the idea that human love is in some way a participation in divine love (cf. 1 John 4:7–8).

C. History of Interpretation

The history of the interpretation of the Song is not as bizarre as some are inclined to think. Although Pope (*Song of Songs* AB, 89) writes that no other biblical book "has had so many divergent interpretations imposed on its every word," there is a remarkable unity to be found in the history of its interpretation. Basically this has expressed itself in two directions. As indicated above, the modern view, especially from the 17th century on, is that the Song deals with human love. But for centuries before this, the common understanding of the Song was that it described the love of God and God's people. There is extraordinary agreement between both Jewish and Christian tradition on this point. For the Jewish community, the Song reflected the love relationship between God and Israel. For Christians, the theme was the love relationship between God (Christ) and the Church (or also, the individual person).

This view has been called "allegorical," because the use of allegory as an interpretive method has been employed. But the view can be divorced from the allegorical method, and simply called the "traditional" understanding. Properly speaking, an allegory is a literary work in which the various details in the text

have a transferred meaning (cf. Ezek 17:1–24; Eccl 12:3–4). But an allegorical interpretation is not to be foisted on a text which is not intended as an allegory. The Song was not written as an allegory, but the allegorical method of interpretation, so popular in the Hellenistic age and later, has been employed in exaggerated fashion by the representatives of the "traditional" interpretation.

The Targum interprets the Song (Gollancz 1973) as an historical allegory of Israel's history from the Exodus through the entry into Canaan and the establishment of the monarchy, down to the exile and restoration. The same view is reflected in the Midrash Rabbah, a verse by verse commentary on the biblical text. Ginsburg (1857:20–60) has provided a brief sketch of the steady development of the traditional view among Jewish scholars through the medieval and modern periods. He notes that the translation of the Song by Moses Mendelssohn in 1788 marks a turning point, as a tendency to the literal sense began to appear (1970:58–59). The literal understanding has been continued by several Jewish scholars (Gordis 1954; Jastrow 1921; Fox 1985).

The most influential Christian commentator on the Song of Songs has been Origen, whose homilies (covering 1:1–2:14) and three volumes of a ten volume commentary (covering 1:1–2:15) have been preserved (see Lawson 1957). While he is aware of a literal sense, his exposition is motivated by what he considers pastoral concerns, and hence the Song deals with the relationship between Christ and the Church (and the individual soul). He has recourse to allegory in order to develop this point of view. Another major influence was Gregory the Great (d. 604). He too was aware of the obvious meaning of the text, but he used allegory "as a certain machine" to elevate the soul to God (Murphy 1981a: 511). Obviously, the traditional interpretation of the Song in the Christian community was motivated by certain ascetic and spiritual views that prevented a proper understanding of the literal historical sense. Yet the Song became one of the most popular books in the Middle Ages, when it was accorded more "commentaries" than any other OT book. In the 12th century alone, there were some thirty commentaries written on the Canticle. Outstanding among these is the work of Bernard of Clairvaux: Eighty-six sermons delivered over a period of eighteen years, 1135–1153 (see Bernard 1980). These were conferences to his fellow monks, the Cistercians of Clairvaux where he was Abbot, and he did not succeed in getting beyond chap. 2! Again, the interpretation is the traditional one, but the outlook is refreshing. Although the allegorical method is not absent, Bernard had the knack of recognizing the experience of love which is in the Song. He called it "the book of experience" (Sermon 3, 1), and for him the greatest experience is love: "Love is alone sufficient by itself; it pleases by itself, and for its own sake. It is itself a merit, and itself its own recompense. It seeks neither cause, nor consequences, beyond itself. It is its own fruit, its own object and usefulness. I love, because I love; I love, that I may love" (Sermon 83, 4).

The traditional understanding is reflected also in a masterpiece of Spanish poetry, the "Spiritual Canticle" of John of the Cross (d. 1591). It was composed in the sufferings of imprisonment, and utilizes the phraseology of the Song in order to express a spiritual union with God. The influence of the traditional interpretation has been paramount in the history of literature (Scheper 1971).

With the Reformation, there is only a slight deviation from tradition. Luther's commentary accepts Solomonic authorship, and he interprets the work as "an encomium of the political order, which in Solomon's day flourished in sublime peace" (*WA* 15:194–95). The allegory remains, but the referents have changed. However, the allegorical approach continued to be dominant among Protestant writers for the next several centuries. Among Catholic writers there was a practical unanimity inherited from the past, concerning the traditional meaning of the Song up to the middle of the 20th century. Since then the common understanding has shifted to the recognition that the direct literal sense deals with human love. Further dimensions of interpretation are indicated as the "typical" sense (Miller 1927), or *double entendre* (Tournay 1982), or as simply another level of meaning (Murphy 1981a).

ROLAND E. MURPHY

SONGS OF THE SABBATH SACRIFICE. A Dead Sea Scroll text Extant in 8 fragmentary copies from Qumran Cave 4 (*4Q400–407*), one from Cave 11 (11QShirShabb), and one from Masada (MasShirShabb), as reconstructed, the original composition contained a cycle of 13 songs, one for each of the first 13 Sabbaths of the year. Each song began with a heading and date (e.g., "By/for the instructor. Song of the whole-offering of the 7th Sabbath on the 16th of the month"). A call to praise God, addressed to the angels, followed. The body of the songs were variously developed, but each contained some description of angelic praise, the heavenly temple, and the angelic priesthood. From the imperative calls to praise and the occurrence of some first person plural forms (e.g., "How shall we be considered," "let us exalt"), it appears that the songs were intended for communal worship.

Although many of the songs are preserved only in a highly fragmentary condition, there seems to have been an overall structure to the work. The first 5 songs contain an account of the angelic priesthood. Songs 6 and 8 are formulaic descriptions of the praises and blessings of the 7 chief and deputy princes. The 7th song consists of 7 calls to praise addressed to the 7 angelic councils, followed by an account of the praises of the heavenly sanctuary itself. The 9th through the 13th songs describe the heavenly temple and its praise of God. The 12th song contains a lengthy description of the *merkābāh,* the chariot throne of God (see Ezek 1:10). In the final song the vestments of the angelic high priests are described.

It is difficult to say with certainty whether the Sabbath Songs were composed by the Qumran community. The presence of one copy at Masada and the use of *ʾĕlōhîm* as a divine name (avoided in other Qumran sectarian literature) could indicate a pre-Qumran origin for the text. Whether that is the case or not, the large number of mss at Qumran and the influence of the Sabbath Songs on certain clearly sectarian compositions (the *Songs of the Maśkil* [*4Q510–511*] and the *Blessings and Curses* [*4QBerakot*$^{a–f}$]), indicate that the *Songs of the Sabbath Sacrifice* were highly influential at Qumran. The content of the material makes it likely that the Sabbath Songs were composed for a group with a strong priestly identity. While there is no evidence from the content for a date of composition, the paleography of the oldest mss suggests a date not much later than the beginning of the 1st century B.C.E.

As liturgical texts, the Sabbath Songs are not apocalypses. But their description of the heavenly temple is in many respects close to what one finds in *1 Enoch* 14, the *Testament of Levi*, and Revelation. Similarly, although they do not appear to have been used in individual mystical praxis, the Sabbath Songs share many features of content and style with the texts of *hêkālôt* or *merkābāh* mysticism.

CAROL A. NEWSOM

SONS OF GOD. In Greek literature from Homeric times there is the idea of Zeus as "father of gods and men." In the later Greco-Roman Mediterranean world, Stoic philosophy stressed the unity of humankind on the basis that all are by nature children of God. An echo of this appears in the quotation of a well-known verse of the poet Aratus put on Paul's lips in the Areopagus speech (Acts 17:28). But the biblical idea of divine sonship and more specifically the Christian conception of believers as "sons/children of God" owes little to such external influences, having its roots in ideas and forms of expression enshrined in early Israelite theology. This article will trace divine sonship patterns in the OT, Intertestamental and Rabbinic Literature, before examining the NT data. See also SON OF GOD.

A. Old Testament

The designation "sons (son) of God" occurs in the OT in three clearly definable categories depending on whether it refers (1) to divine or angelic beings; (2) to Israelites or Israel as a whole; or (3) individually to the king.

The use of the expression "sons of God" (more correctly "sons of the gods") with reference to heavenly beings does not imply actual progeny of God (or the gods) but reflects the common Semitic use of "son" (Heb *ben*) to denote membership of a class or group. "Sons of the gods," then, designates beings belonging to the heavenly or divine sphere. Such allusions to a plurality of divine beings, occurring especially in the Psalms and related poetic literature, represent a stage when Israel's Yahwism found room for a pantheon in many ways similar to Canaanite models (cf. the literature of Ugarit). In the Bible, however, such beings are clearly subordinate to Yahweh, forming his heavenly court or council (Job 1:6; 2:1; 38:7; Pss 29:1; 82:6; 89:6; cf. Deut 32:43 LXX). Echoes of deliberation with such a court can be heard in the mysterious plural references of Gen 1:26; 3:22; 11:7. As shown by the episode related in Gen 6:1–4, where the "sons of the gods" take wives from the daughters of men, and also by Ps 82:6–7, a key point of distinction between the "sons of the gods" and human beings lay in the matter of life and death: humans remain mortal, unless given a share in the "spirit" common to Yahweh and his host. Eventually the "sons of the gods" were fused with the concept of angels—a development already to be seen in Dan 3:25 and reflected, for the most part, in the LXX.

The description of Israel or Israelites as "sons (son) of God," together with the corresponding idea of God as "Father," is hardly a leading or frequently occurring motif in the OT, though it does feature across a fairly wide cross section of texts. The usage never implies real paternity on God's part. Rather, in a metaphorical way it expresses the intimate and unique relationship between Yahweh and Israel, founded upon the fact that he has chosen and created this people for himself (Deut 14:1; 32:5–6, 19–20; Isa 43:6–7; 64:8; Jer 2:27; Mal 2:10). This filial relationship, while offering assurance and hope for Israel (Isa 63:8,

16; Jer 31:9, 20), also requires a faithful pattern of life. Thus assertions of sonship often serve to heighten reproach (Deut 32:5–6; Isa 1:2–4; 30:9; Hos 11:1–2). In such situations Israel can expect the kind of discipline that sons receive from their fathers (Deut 1:31; 8:5; Mal 1:6; 3:17; Prov 3:11–12). The simple metaphor of sonship becomes a more formal and explicit statement in certain contexts where Israel's status as God's people is affirmed over against other nations (against Pharaoh in Exod 4:22–23; cf. Deut 14:1–2). The association of sonship and "people of God" comes out in a particularly striking way in the oracle of salvation in Hos 2:1 (—Eng 1:10):"… and in the place where it was said to them, 'You are not my people,' it shall be said to them 'Sons of the living God.' " Thus sonship emerges from the OT tradition as the unique privilege of Israel, chosen and created by God. Upon Israel it imposes a peculiar loyalty and obedience; from outsiders it draws acknowledgment and respect.

The privilege of sonship in the OT is focused upon an individual solely in the person of the king. Although the actual phrase "son of God"—let alone "son of Yahweh"—never occurs, the idea appears in two ancient "royal" psalms (Pss 2:7b: "He [the Lord] said to me, 'You are my son, today I have begotten you' "; and 110:3 [assuming that the LXX (Psalm 109) represents the original reading]). Likewise, a filial relationship to God, with its threat of admonition as well as assurance of protection, features in the dynastic oracle to the house of David spoken by Nathan the prophet (2 Sam 7:14: "I will be his father and he shall be my son"; 1 Chr 17:13; 22:10; 28:6; Ps 89:19–37). The idea of a divine "begetting" of the king echoes the royal ideology of surrounding cultures (esp. Egypt). But the Israelite dynastic oracle sets the filial relationship firmly within the framework of the covenantal theology that applies to the people as a whole. While sonship bestows dominion and divine protection, it also promises on God's part intolerance of disloyalty and sin. The "royal" sonship is, then, a microcosm of the divine sonship of all Israel.

B. Intertestamental Literature

The usage of "sons (son) of God" to denote heavenly beings continues in a broad range of Jewish texts right up to the time of the rise of Christianity. But now, as already in Dan 3:25, the reference is simply to angels (Wis 5:5; *1 En.* 6:2; 13:8; 14:3 [all as "sons of heaven"]; 69:4–5; 71:1; 106:5–6; *T. Ab.* 12:6; Seth fragment in Cedrenus [Migne, *PG* 121 Col. 8 (p. 41)]; *Jos. Asen.* 16:14; *L.A.B.* 3:1; 1QHf 2:3).

Somewhat isolated references to Israel (Israelites) as " (firstborn) son(s) of God" occur in a broad scattering of texts, especially in contexts where a sharp distinction is made between Israel and other nations (Sir 36:12 [LXX 16b]; Wis 9:7; 12:7, 20–21; 16:10, 21, 26; 18:4, 13; 19:6; Jdt 9:4, 13; *2 Bar.* 13:9; *3 Macc.* 6:28; 7:6; *Pss. Sol.* 17:30; *Jub.* 1:25–28; 2:20; *4 Ezra* 5:28; 6:58; *Assum. Mos.* 10:3; *L.A.B.* 32:10; 4QDibHam 3:4–6). "Son(s) of God" (or its equivalent) becomes virtually a synonym for "people of God" (= Israel), while the OT associations of election, closeness to God, and special protection continue. The ethical aspect of the sonship metaphor also continues (Add Esth 16:14–16; *Pss. Sol.* 17:30; *L.A.B.* 16:5), often associated with the idea of disciplinary chastisement (Wis 12:20–21; 16:10–11; *Pss. Sol.* 18:4).

A fresh development, however, is the considerable frequency with which the motif occurs in eschatological contexts. This suggests that it was an epithet felt to be particularly apt to describe the ideal Israel of the end time, the holy and purified people of God, destined to possess or actually in possession of the blessings of salvation (*Jub.* 1:25–28; *Pss. Sol.* 17:30; *Sib. Or.* 3:702–4; 5:248–50). Frequently, acknowledgment of sonship suggests the idea of rescue from or immunity to death. Connected with this is a widespread tendency in the intertestamental period to characterize the future awaiting the righteous as a restoration of the angel-like immunity to death enjoyed by human beings before the fall (*1 En.* 69:11; *2 En.* 30:11; Wis 1:23–24), along with other angelic characteristics and privileges such as a shining countenance, vision of God, and presence at the heavenly liturgy (Wis 5:5; *2 Bar.* 51:3–12; *Pr. Jos.* A). The combination of these motifs in the eschatology of several texts suggests a conflation in the later period of the formerly separate categories of "Israelite" and "heavenly being (angelic)" divine sonship (Byrne 1979).

For the intertestamental period there is as yet no direct evidence of the individual "son (child) of God" title applied to a Davidic ruler in the titular way associated with later Christian messianism—though fragmentary texts from Qumran (4QFlor; 4QpsDan ar[a]) point to some degree in this direction. More

striking is the frequent use of the singular "son/child *(huios, pais)* of God" in Wisdom 2–5 to denote the individual righteous person, whose ultimate immunity to death and whose destiny to eternal life is acknowledged by his persecutors (Wis 2:16–18; 5:5). The frequent occurrence of the sonship theme in the final part of Wisdom, the great midrash upon the rescue of Israel from Egyptian persecution and pursuit (chaps. 10–19), represents a "democratization" of the individual usage occurring in the early chapters; like the righteous person of chaps. 2–5, the righteous nation, made up of God's sons, receives mild discipline, special favor, and rescue from the clutches of the enemy (12:7, 20; 16:1, 26; 18:4, 13; 19:6).

Though sometimes proceeding from the relevant biblical texts (Deut 14:1 and 32:18 in Philo, *Conf.* 145–46), expressions of divine sonship in Philo have more in common with Stoic-Platonic models and are used to reinforce the moral qualities required for the ascent of the truly wise person to the knowledge and vision of God. Significantly, it is God's Word *(Logos),* himself the "Firstborn Son," who assists human beings in this process, which involves, according to one passage (*Sobr.* 56), becoming "by adoption" God's only son.

C. Rabbinic Literature

The motif of Israel (Israelites) as "son (sons) of God" occurs fairly frequently in Rabbinic literature from the earliest period onward (R. Akiba, *m. ʾAbot* 3:15; R. Yose the Galilean, *Mek.* on Exod 15:18). These show an explicit awareness of sonship as a unique privilege. In the 2d century there is a dispute as to whether sonship is an abiding privilege independent of behavior or whether it is to be seen in ethical terms, coming and going according to practice (*b. Qidd.* 36a). Later texts seem to reflect long-standing disputes with Christians as to whether Israel's sonship privilege can be extended to gentiles (*Pesiq. R.* 5:1).

All this material reflects an explicit consciousness of divine sonship as a distinctive privilege of Israel, especially in connection with eschatological restoration, at the time of the rise of Christianity.

D. The New Testament

In the NT the designation of believers as "sons *(huioi)*" or "children *(tekna)* of God" occurs as a major motif in the Pauline and Johannine literature, although there are isolated references elsewhere. However, the sense of God as "Father" and the disciples of Jesus, correspondingly, as "sons/children" is probably far more central in the Synoptic tradition than the scattered allusions might suggest: Matt 6:9 = Luke 11:2 (the Lord's prayer); Matt 5:45 (the exhortation to love one's enemies in order to be "sons of your Father in heaven"); the implications of the exhortation to petitionary prayer (Matt 7:9, 11 = Luke 11:11–13). While the references just mentioned bring out the ethical side of sonship (Eph 5:1), the eschatological sense emerges in the beatitude of Matt 5:9 and more strikingly in the teaching on the resurrection in Luke 20:36 (where being "sons of God" and "sons of the resurrection" is linked with being equal to angels). A similar sense seems to attend the allusion in Heb 2:10 to God's leading "many sons to glory"; here Christian sonship is clearly patterned upon that of Christ, who bears the "Son" title in a unique way (1:1–13). Later in Hebrews (12:5b–6 [a quotation from Prov 3:11–12]) the "disciplinary" aspect emerges to explain the trials of persecution.

1. The Pauline Literature. In Rom 9:4 Paul lists *huiothesia* (sonship) among a traditional list of Jewish privileges. The term does not occur in the LXX or in any Hellenistic Jewish texts but its use is widespread in Greek literature and inscriptions to denote the common Greco-Roman custom of "adoption." There is a sense in which adoption well suits the Jewish idea of sonship with its basis in election and creation rather than any suggestion of divine procreation. On the other hand, adoption in the strict sense was not a Jewish custom and it may be best not to tie *huiothesia* too narrowly to this meaning, but rather to see behind the term (also in Rom 8:15, 23; Gal 4:5; Eph 1:5) principally the long-standing biblical tradition of Israel (Israelites) as "son (sons) of God."

In Galatians the motif of divine sonship indicates the status of freedom which believers enjoy in the new age, in contrast to the slavery and fear of the old age. The Galatians are tempted to go back into the old age of slavery and set about earning the eschatological blessings by taking on the yoke of the law. But Paul points to the experience of the Spirit (3:2, 5; 4:6–7) as empirical evidence that their believing response to the gospel has ushered them into the new age in which they already enjoy the status of sons.

He blends the argument from experience with a complex scriptural proof showing Christ, as unique "seed" (3:16), to be the sole heir of the promise to Abraham "and to his seed." Believers, including most notably Gentile believers, share in the sonship status and the inheritance only by "entrance" into Christ through faith and baptism (3:26). Thus Christian sonship is God's eschatological gift, enabled by the redemptive death of Christ. It has a totally christological base, attested by the fact that the Spirit of the Son impels the baptized to address God in the way distinctive of Jesus: "*Abba,* Father" (4:6; Rom 8:15; Mark 14:36).

In Romans 8, Paul introduces sonship at the point where his discussion of the new freedom made possible by the Spirit opens the prospect of the hope for eternal life (the statement in v 14 that "all who are led by the Spirit of God are sons of God" picks up the "will live" at the end of v 13). Sonship is a present reality, attested, as in Galatians 3–4 by the experience of the Spirit (vv 15–16). But this is so in a hidden way, surrounded by suffering. The public revelation of sonship awaits the fullness of eschatological existence and will be shown by resurrection (8:23), in which the freedom and glory of the "sons/children of God" will be revealed, accompanied by the restoration of all creation (8:19, 21). All this is simply the unfolding of God's eternal plan that human beings should share the "image of his Son (the risen Lord)" so that he would be "Firstborn among many brethren" (8:29–30).

The upshot of Paul's argument in Romans 8 is that God has conferred the eschatological sonship upon all believers, Jewish and gentile alike. The acute problem this raises with respect to the unique Jewish privilege implied in the traditional understanding is part of the general problem addressed in chaps. 9–11. In a complex scriptural argument, Paul first establishes that sonship does not derive from fleshly descent from Abraham nor does it involve any human meriting, but rests entirely upon God's free choice and election (9:6–18). He finally employs the text of Hos 1:10 (blended in a creative way with 2:23) to indicate God's purpose to include the Gentiles (originally "not my people") within the scope of God's eschatological call to sonship (9:22–26).

An isolated reference in Phil 2:15 shows a more ethical view of sonship based on Deut 32:5. In 2 Cor 6:18, possibly a fragment from an earlier text, we have eschatological sonship in the shape of the Davidic oracle (2 Sam 7:14) rendered in a more "inclusive" and "democratic" form: "you will be to me sons and daughters." A similar use of the oracle occurs in Rev 21:7.

2. The Johannine Literature. In contrast to the more fluid Pauline usage, the Johannine literature reserves the strict sonship language *(huios)* for Jesus Christ, describing believers as "children *[tekna]* of God."

In the Gospel of John the expression occurs only twice (1:12; 11:52), but there are indications that the title and status occupy a central place in the self-understanding of the Johannine community. In the first instance a structural analysis of the Prologue shows that the "power to become children of God" (v 12), those who are "begotten of God" (v 13) is in fact the central affirmation (Culpepper 1980). To Nicodemus, representative of sympathetic Pharisaic Judaism, Jesus insists that entrance into the eschatological age likewise involves a being "born from above" (3:3, 5). Although the actual title does not occur, the identity of the real children of God and the criterion by which this is established stands at the center of the debate between Jesus and "the believing Jews" in 8:31–47. The latter base their claim to sonship and freedom on the basis of being "seed of Abraham." Jesus contests that they are true descendants of Abraham and asserts that they, in fact, have the devil, not God, as their father because of their murderous intent towards himself (vv 39–44). Such passages appear to reflect debates between the Johannine community and Jewish groups as to the criterion of the eschatological divine sonship and its true possessors. Similarly, the comment in 11:51–52 that the high priest's prophecy unwittingly but accurately foretold the effect of Jesus' death, namely that it would serve to gather into one all the "scattered children of God," shows a Christian redefinition of the epithet, reminiscent of Paul: the eschatological Israel is gathered from all believers, Jewish and gentile, who constitute the "children of God."

In 1 John the sonship claim again features in a context of dispute—this time dispute within the Johannine movement itself. Sonship is a status conferred by God and, as in the Gospel, stems from being

begotten of God (2:29–3:2; 3:9–10; 5:1–4). It is a present possession but, as in Romans 8, there is a completion of sonship, yet to be revealed (3:1–2). The polemical context, however, in a way reminiscent of John 8, brings to the fore the ethical aspect of sonship: the "children of God" are distinguished from the "children of the devil" by the fact that they do not sin, that they do righteousness (3:10), that they love both God and the "children he begets," that is, the true members of the community (5:1–2).

From both the Pauline and Johannine literature it is clear that the motif of divine sonship, traditionally understood as a distinctive eschatological privilege of Israel, had a place at the center of Christian attempts at self-definition both with respect to Israel and also to the inclusion of the gentiles until the close of the 1st century C.E.

BRENDAN BYRNE

SOOTHSAYER. See MAGIC (OT).

SOPATER (PERSON) [Gk *Sōpatros* (Σωπατρος)]. A Christian from Beroea identified as the son of Pyrrhus (Acts 20:4). Sopater, along with numerous others, accompanied Paul from Greece (probably Corinth) through Macedonia as Paul made his way to Jerusalem, presumably carrying a collection (cf. 24:17). Sopater and Paul's other companions sailed ahead to Troas (20:5) where Paul caught up with them and stayed for seven days (20:6). Sopater and the others were probably present at Paul's preaching in Troas when Eutychus was overcome with sleep and fell out of the window (20:7–12). It is not evident whether Sopater went on with Paul to Jerusalem.

Because Sopater's name is a shortened form of Sosipater, he may be identical to the person of the latter name mentioned in Rom 16:21. See SOSIPATER. The linking of Sopater with various Thessalonians in Acts 20:4 and of Sosipater with Jason in Rom 16:21 argues for the identification. See JASON #2.

FLORENCE MORGAN GILLMAN

SOPHERETH (PERSON) [Heb *sôperet* (סוֹפֶרֶת)]. Var. HASSOPHERETH. Head of a family of SOLOMON'S SERVANTS who returned from the Babylonian exile to Jerusalem with Zerubbabel and Jeshua, between 538 and 520 B.C.E. (Ezra 2:55; Neh 7:57; 1 Esdr 5:33). Written as Hassophereth in Ezra 2:55 and 1 Esdr 5:33 (lit. "the female scribe") and as Sophereth in Neh 7:57 (lit. "female scribe"), this name may denote a profession which had become a proper name (Williamson *Ezra, Nehemiah* WBC, 27) or "the guild or office of scribes" (Fensham *Ezra and Nehemiah* NICOT, 55). The definite article in Ezra 2:55 suggests the latter. The feminine form is of special interest. Although conclusions from names are always tenuous, it is worth considering the possibility that this family owes its origin to a female scribe. The presence of female scribes in the ANE has been documented (Meier fc.). Ezra-Nehemiah itself indicates that a clan may take the name of its matriarch: according to Ezra 2:61 (Neh 7:63 and 1 Esdr 5:38) the Barzillai clan is named after the wife because the man has taken her name. Similar developments may account for this name.

The clan of Hassophereth comes second in Ezra-Nehemiah's lists of Solomon's servants and first in 1 Esdras's, a position which may indicate prominence within this guild. The origin of the guild is possibly preexilic. Some scholars conclude from 1 Kgs 9:20 that they were originally enslaved foreigners. Levine (1963), however, suggests that the term denotes Israelite officials supervising foreigners. In the postexilic era, the term "servant" typically refers to officials. Like the Temple servants (NETHINIM), Solomon's servants were temple functionaries (Weinberg 1975). They were members of the congregation of Israel and separated thereby from slaves (Ezra 2:64). The size of the clan of Hassophereth is unknown. Its

members, combined with the rest of Solomon's servants and temple servants, add up to 392 in Ezra-Nehemiah (372 in 1 Esdras).

TAMARA C. ESKENAZI

SOPHIA OF JESUS CHRIST (NHC III,*4*). See EUGNOSTOS AND THE SOPHIA OF JESUS CHRIST.

SORCERER, SORCERY. See MAGIC (OT); PUNISHMENTS AND CRIMES.

SOREG [Heb *sôreg* (סוֹרֵג)]. See TEMPLE, JERUSALEM.

SOREK, VALLEY OF (PLACE) [Heb *naḥal šōrēq* (נַחַל שֹׂרֵק)]. A valley mentioned by name only once in the Bible (Judg 16:4). The name refers primarily to a relatively broad valley in the Shephelah some 21 km (13 miles) W of Jerusalem, but also to the occasional river (Nahal Soreq) and to the system which includes the Chesalon and the Rephaim valleys which join the Sorek to drain a 16 km (10 mile) section of the watershed W of Jerusalem extending from Ramah to Bethlehem. These wadis drop ca. 610 m (2000 ft) through the Judean mountains, cutting deep v-shaped canyons into the hard limestone as they flow from E to W. This canyon system, along with those of the Aijalon and Elah, make N-S travel in Judah virtually impossible W of the ridge route. As the Sorek reaches the softer limestone and chalk of the Shepehlah (foothill region), the valley broadens out. And as the flow slows in the lower elevations, alluvial soil is deposited making a rich fertile valley. Travel both N-S and E-W is much easier.

The lower valley served as the border between the territories allotted to the tribes of Dan and Judah (Josh 15:9–12; 19:40–49). However, because of its strategic location and fertility, it was also greatly desired by the Philistines whose domination of the area adjacent to the Philistine Plain eventually led to the migration of Dan to Laish in the N (Judges 18).

Samson was from the Sorek: born in ZORAH (Judges 13) and buried between there and Eshtaol. He married a Philistine woman from Timnah and later loved Delilah who was also from the Sorek (Judg 16:4). The Philistines returned the Ark of the Covenant from Ekron via the Sorek Valley to Beth-shemesh (1 Sam 6:1–7:2).

The strategic importance of the valley is illustrated by the fact that during the divided monarchy, Zorah along with a number of other cities along the Shephelah was fortified by Rehoboam and successors to defend the hill country from any incursions from the coastal plain (2 Chr 11:5–12; cf. 14:6–7). Around 780 B.C., Joash king of Israel defeated and captured Amaziah king of Judah at Beth-shemesh, and from there climbed up to plunder Jerusalem (2 Kgs 14:11–14). Hezekiah (715–686 B.C.), conquered the Philistine Plain once again only to find it overtaken by Sennacherib in 701 (2 Kings 18–19; 2 Chronicles 32; Isaiah 30; 36; 37).

PAUL WAYNE FERRIS JR.

SORES. See SICKNESS AND DISEASE.

SOSIPATER (PERSON) [Gk *Sōsipatros* (Σωσιπατρος)]. The name of two different persons mentioned in the Greek canon of the OT and in the NT.

1. One of the commanders under Judas Maccabeus in the war against Timothy in Transjordan. He and Dositheus, who served with him, took Timothy prisoner, but were later convinced by him to let him go (2 Macc 12:19–25).

2. A Christian referred to by Paul in Rom 16:21, along with Lucius and Jason, as Paul's "kinsman." Presumably this meant that like Paul these three men were also Jewish Christians. Sosipater and the others are mentioned by Paul as sending greetings to the recipients of the Epistle to the Romans. Thus he must have been present with Paul in Corinth as that letter was being written in ca. 58 C.E. It is possible

Sosipater is identical to the Sopater mentioned in Acts 20:4, who at approximately the same time travelled with Paul as he left Corinth to deliver the collection to Jerusalem. See SOPATER; JASON #2.
FLORENCE MORGAN GILLMAN

SOSTHENES (PERSON) [Gk *Sōsthenēs* (Σωσθενης)]. A "ruler of the synagogue" *(archisynagōgos)* in Corinth, mentioned in Acts 18:17 in connection with Paul's being haled before Gallio. Sources suggest the *archisynagōgos* fulfilled a variety of leadership roles in the ancient synagogue.

Acts 18:12–17 relates an incident where "the Jews" accuse Paul before the Roman proconsul Gallio, claiming he teaches others "to worship God contrary to law." Gallio refuses to judge, declaring it an internal Jewish matter. Following this unsuccessful attempt to trap Paul, the crowd seizes Sosthenes, the "ruler of the synagogue" and beats him before the tribunal. Gallio is indifferent and takes no action. Several commentators have suggested Sosthenes' beating is a burlesque touch, where the one who sought to persecute another becomes a victim himself. However it is not clear that Sosthenes was one of Paul's accusers. Nor does the text make explicit whether the angry mob which attacks Sosthenes is his own Jewish constituency turning on him for his failure to secure Paul's arrest, or a crowd of gentile bystanders in an anti-Semitic frenzy. However, opinion seems to favor the latter view.

Sosthenes need not have succeeded Crispus, who had become a Christian, as some commentators maintain, since ancient sources show there could be more than one *archisynagōgos* at a time.

Paul refers to "our brother Sosthenes" in 1 Cor 1:1. Some interpreters have assumed that this is the same Sosthenes mentioned in Acts, but such an identity cannot be proven. If the two are one and the same person, then he would have become a believer in Jesus sometime after the incident before Gallio. See Acts commentaries in Hermeneia, MeyerK, and HTKNT.
CLAUDIA J. SETZER

SOSTRATUS (PERSON) [Gk *Sōstratos* (Σωστρατος)]. Sostratus was the Seleucid governor (Gk *eparchos*) of the citadel in Jerusalem while Antiochus IV Epiphanes was king and Onias-Menelaus was serving as high priest (172 B.C.E.). 2 Macc 4:28–29 states that Sostratus as governor was responsible for collecting monies owed to Antiochus IV by the high priest. 2 Maccabees 4 appears to indicate that Sostratus, as governor of the Syrian garrison in Jerusalem, collected taxes *(diaphora)* on behalf of the king. As reasonable as this seems, at least in this case the issue is not tax money but arrears owed to the king by the high priest (Bickerman 1980:163–64). Onias-Menelaus held the office of high priest at the good will of the Syrian king and by force of Syrian arms in Jerusalem. Antiochus' need for funds had moved him to replace the high priest Jason with Onias-Menelaus as the latter had promised access to the Temple treasury (Tcherikover 1977:170). The high priest Onias-Menelaus was not forthcoming with the promised funds and the Syrian commander Sostratus was unable to collect on the debt.

MICHAEL E. HARDWICK

SOTAI (PERSON) [Heb *soṭay* (סָטַי)]. Head of a family of SOLOMON'S SERVANTS who returned from the Babylonian exile to Jerusalem with Zerubbabel and Jeshua, between 538 and 520 B.C.E. (Ezra 2:55, Neh 7:57). The family of Sotai heads the list of ten families of Solomon's servants in Ezra-Nehemiah, perhaps denoting its distinction in this guild. 1 Esdras, however, omits the name altogether. Each occurrence of the name is slightly different although the consonants remain the same. None of these variations helps to identify the family's origin or its specific role among Solomon's servants.

The guild of Solomon's servants is probably preexilic. Some scholars conclude from 1 Kgs 9:20 that they were originally enslaved foreigners (See Weinberg 1975). Levine (1963) however, suggests that the term denotes Israelite officials who supervise foreigners. In the postexilic era, the term "servant" typically refers to officials. Like the Temple Servants (NETHINIM), Solomon's servants are temple functionaries. Although they appear last in the list of members of the congregation (which suggests a low status), they are clearly separated from slaves, who are not included as members (Ezra 2:64). The size of the Sotai

family is unknown. Its members, combined with the rest of Solomon's servants and temple servants, add up to 392 in Ezra-Nehemiah (372 in 1 Esdras). See also Blenkinsopp *Ezra-Nehemiah* OTL; Fensham *Ezra and Nehemiah* NICOT; Williamson *Ezra, Nehemiah* WBC.

TAMARA C. ESKENAZI

SOUL, EXEGESIS ON THE. See EXEGESIS ON THE SOUL (NHC II, *6*).

SOULS, PREEXISTENCE OF. A doctrine which teaches that the souls of humans and even animals had a prior existence before being born into mortal bodies. In its appearance among Jewish and early Christian writings, this teaching commonly exhibited influences from Platonic thought. But it also has biblical ties. A notable example consists of these words of the Lord to Jeremiah: "Before I formed you in the womb I knew you, and before you were born I consecrated you; I appointed you a prophet to the nations" (Jer 1:5). A second excerpt which recalls this notion is found in the series of questions put to Job by the Lord about the formation of the earth: "On what were its bases sunk, or who laid its cornerstone, when the morning stars sang together, and all the sons of God shouted for joy?" (Job 38:6–7). Antecedent influences on this excerpt are difficult to trace, although the Psalms speak of celestial hosts who sing praises to the King of Heaven, echoing Ugaritic poetry (cf. Pss. 19:2; 29:2; 148:2–3).

In the NT, the idea appears in the story of Jesus healing the man born blind. At its outset, "his disciples asked him, 'Rabbi, who sinned, this man or his parents, that he was born blind?' " (John 9:2). The concept of a premortal life, in which an individual is able to make choices, lies at the base of the question, indicating that at least the evangelist and his audience shared this view. One must not rule out the possibility that Jesus' disciples also believed the doctrine.

It is conceivable that this concept formed an aspect of Paul's belief, its origins likely lying in his Jewish background. Referring to his turning away from persecuting followers of Jesus, Paul speaks of God as "he who had set me apart before I was born" (Gal 1:15). Another passage, which consists of a thanksgiving to God, reads as follows: "even as he [God] chose us in him before the foundation of the world" (Eph 1:4). Aside from the issue of the Greek vocabulary used here, the verse seems to affirm that in the beginning a celestial plan had been formulated to select persons to fulfill God's purposes; a second dimension may be that God's selection was carried out among persons during a preexistent state.

Jewish sources also reveal the idea of a preexistence. The Wisdom of Solomon, dating to the 1st century B.C.E. and exhibiting Platonic influence, has Solomon say the following in a prayer: "As a child I was by nature well endowed, and a good soul fell to my lot; or rather, being good, I entered an undefiled body" (8:19–20). *2 Enoch,* whose origin is likely Jewish, states that "all souls are prepared for eternity, before the composition of the earth" (23:5), and later hints at Adam's preexistence (chap. 32). In a passage that may be laced with Greek influences, Josephus records that the Essenes, who denigrated the body, believed that "the soul is immortal and imperishable. Emanating from the finest ether, these souls become entangled, as it were, in the prison house of the body, to which they are dragged down by a sort of natural spell" (*JW* 2.8.11). Later rabbinic writers, as well as Philo of Alexandria, also held to this teaching.

Among early Christian writers, the most notable proponent of the doctrine of the preexistence of souls was Origen. For him, the eternal goodness of God required that, since he now dispenses gifts to his creatures, he must always have done so. "It is absurd and impious to suppose that these powers of God have been at any time in abeyance for a single moment … We therefore can imagine no moment whatever when that power was not engaged in acts of well-doing. Whence it follows that there always existed objects for this well-doing, namely, God's works or creatures" (*Princ.* 1.4.3). The justice of God, which operates even in the station of life which one inherits, demands that "all rational creatures [be] of one nature, and it is only on this ground that the justice of God in all his dealings with them can be defended, namely, when each contains within himself the reasons why he has been placed in this or in that rank of life" (3.5.4). Thus Origen's concept affirmed a premortal period in which individual souls were able to

make choices. His views were condemned officially in A.D. 553 in the opening Anathema of the Second Council of Constantinople.

Texts recovered in the Nag Hammadi library, of both Jewish and Christian origin, illustrate that the belief in a preexistence was shared by some gnostics. According to the *Gos. Eg.* in Codex III, Adam was known as a premortal great one who associated with the "holy men of the great light," "men of the Father" (50:12–14). In a related vein, the heavenly Seth was said to have proposed the gathering of a council of premortal souls, then spelled out a plan "to the whole multitude of the multitudinous assembly" which was received with rejoicing by "the whole house of the Father of Truth." Consequently, Seth was sent "to reveal the glory [of the Father] to [his] kindred and [his] fellow spirits" (*Treat. Seth,* 50.1–24). In addition to notable personalities, there is evidence that the souls of others enjoyed a preexistent life. In Saying 4 of the *Gos. Thom.,* the following is attributed to the risen Jesus: "The man who is old in days will not hesitate to ask a child seven days old about the place of life, and he will live." The sense is that a child who has not yet been circumcised on the eighth day has retained an impression of the "place of life," which allows the old man to inquire. Both the *Ap. Jas.* and the *Tri. Trac.* hint at the notion of a premortal life for at least the souls of the elect. See also *IDB* 3:869–70; *ERE* 10:235–41.

SOURCE CRITICISM. Formerly called "literary criticism" or "higher criticism," source criticism is a method of biblical study which analyzes texts that are not the work of a single author but result from the combination of originally separate documents. This method has been applied to texts of the Old Testament (especially but not exclusively the Pentateuch) and New Testament (especially but not exclusively the gospels). This entry surveys the application of this method to those texts.

A. Definitions

Modern literary conventions forbid plagiarism, and require authors to identify and acknowledge any material they have borrowed from another writer. But in ancient times it was common to "write" a book by transcribing existing material, adapting and adding to it from other documents as required, and not indicating which parts were original and which borrowed. The OT contains few books which are the work of a single author throughout; for the most part its books are composite, and in some cases the source materials are drawn from original documents that may be spread over several centuries. Source criticism seeks to separate out these originally independent documents, and to assign them to relative (and, if possible, absolute) dates.

Source criticism is to be distinguished from other critical methods. Where original documents prove not to have been free compositions, but to rest on older, oral tradition, FORM CRITICISM may then be used to penetrate behind the written text. The study of the editing process, whereby the sources have been linked together and incorporated into the present, finished text belongs to the province of REDACTION CRITICISM. Source criticism should also be distinguished from textual (sometimes called lower) criticism, which is concerned to establish the exact wording of the earliest manuscript of the present text, not to reconstruct hypothetical earlier stages in the text's growth. Nevertheless, there is some overlap between source and textual criticism, since the telltale signs that a text is composite may include the kinds of minor inconsistency that scribes were apt to correct when copying manuscripts, and the textual critic needs to be aware of this when making conjectures about textual transmission. Conversely, source critics must be careful not to appeal to such inconsistencies without first making sure that they cannot be accounted for as slips in copying.

B. History and Development

Source criticism, the oldest of all the critical "methods" of biblical study, began in the 17th and 18th centuries, but it was during the 19th century that it seemed to offer the answer to most of the puzzles posed by the pentateuch in particular. By mid-century the present division of the Pentateuch into J, E, D, and P was widely accepted among critical scholars, though P was generally known as E2, or the "second Elohist." See TORAH. A decisive end to older, alternative theories such as the "Fragmentary Hypothesis" (which resisted the idea of a few continuous sources) and the "Supplementary Hypothesis" (a basic outline enriched with accretions) came with the work of Julius Wellhausen (1844–1918). Building on earlier work by de Wette and Karl-Heinz Graf, Wellhausen established, in a series of articles (Wellhausen 1885), that the four-source hypothesis was the most satisfactory explanation of the evidence that pointed to the composite character of the Pentateuch. But he went beyond this to provide for the first time a reasoned dating of the sources. Previously, most scholars had assumed that E2—what we call P, and Wellhausen called Q—must be the oldest of the sources; but Wellhausen showed that the sacred ordinances which form the bulk of the legislation in P found no echo in the actual practices of preexilic Israel, and accordingly placed P in the early postexilic age (see Wellhausen 1957). This, together with the already accepted 7th century B.C. date for D, had the effect of providing an entirely new framework for the history of Israel's religion, and suggested that the religious life of the preexilic age was vastly different from the Judaism that began with Ezra.

Wellhausen's paradigm for understanding ancient Israel continues to be widely influential even where his specific conclusions are rejected, and with his breakthrough in Pentateuchal source criticism the modern era of OT study begins.

In the early years of the 20th century, Wellhausen's conclusions were accepted in the English-speaking world as well as in Germany, despite fierce opposition in the name of orthodox religion. Source-critical work on the prophets had already been pioneered by Bernhard Duhm (1847–1928), and the now usual division of the book of Isaiah into three "sources" of different date found general acceptance at the same time as Wellhausen's analysis of the Pentateuch (see Duhm 1875). Despite the rise of form criticism, which eventually diverted interest from source-critical work, ever more detailed work on the sources of the Pentateuch continued until the Second World War, but from the 1930s onwards a feeling grew that source critics were overreaching themselves by dividing the Pentateuch up too minutely into ever more and more fragmentary sources. One of the first casualties of this skepticism was the belief that the Pentateuchal sources might continue into the books of Joshua and even down to 2 Samuel: Martin Noth's theory, (first articulated in 1943) of a Deuteronomistic History beginning with Deuteronomy eventually established itself as an alternative orthodoxy (See Noth, *NDH*). See DEUTERONOMISTIC HISTORY.

Most German- and English-speaking scholars have continued to accept some version of Wellhausen's hypothesis, but without pressing the details of the source division; moreover, the existence of E has come to be widely doubted. Scandinavian scholars were always less than enthusiastic about source criticism, preferring to think in terms of an extended period of oral tradition in which a basic narrative was supplemented, rather than to assume the existence of discrete written documents. See SCANDINAVIAN

SCHOOL. Since the Second World War Israeli biblical specialists have called in question the whole conceptual basis of Wellhausen's work, and have defended the antiquity of P. See PRIESTLY (P) SOURCE. A renewed interest in source analysis has characterized the work of H. H. Schmid (1976) and J. Van Seters (1975). These scholars, far from sharing the suspicion that P is older than Wellhausen thought, have argued that J, too, is postexilic. OT studies seem in this as in many other ways to have arrived at a pluralist phase, with no one theory holding the field (see Habel 1971; Armdering 1983; Barton 1984).

C. Evidence for Composite Character

1. Inconsistencies. Suspicion that a book is not the work of a single author, composing freely, is most readily aroused when inconsistencies are noticed. These may be of various kinds. In narrative texts it may be impossible to extract a coherent sequence of events. For example, in Gen 12:1, Abram is told to leave Haran after the death of his father, Terah. According to 11:26, Abram was born when Terah was 70; according to 11:32 Terah died at the age of 205; hence Abram must have been 135 when he was called to leave Ur. But 12:4 says that he was only 75 when he left Haran. The difficulty is explained if the story in Genesis 12 is drawn from a different source from the genealogical information in Genesis 11. Thematic inconsistency arises when a text seems to give expression to two incompatible points of view. Thus in the stories about the rise of the Israelite monarchy in 1 Sam 8–12, some accounts seem to regard Saul's election and anointing as reflecting a decision by God (e.g., 9:15–16; 10:1), while others present the people's insistence on selecting a king to be a sinful rejection of God (e.g., 8:1–22; 10:17–19). The simplest explanation is that the compiler of the books of Samuel used more than one already existing account of the origins of the monarchy, and that these accounts did not agree among themselves. On a smaller scale, there are often puzzling inconsistencies of detail, such as the variation in the names used for God in Genesis and Exodus ("Yahweh," "Elohim," "El Shaddai," "El Elyon," etc.).

2. Repetitions and Doublets. In almost every narrative book in the OT a careful reading reveals difficulties in following the sequence of events because the same incident seems to be related more than once. The earliest example is in Genesis 1–2, where in 1:27, "God created man in his own image," but then in 2:7, "the LORD God formed man of dust from the ground," just as if the man's creation had not been mentioned before. Where this kind of repetition is found, the simplest explanation is often that two versions of the same story have both been allowed to remain in the finished form of the book, unreconciled with each other. In some cases material from two or more sources seems to be interwoven: the classic example is the Flood Narrative of Genesis 6–9, where one version speaks of a 40-day flood and the other of a 150-day flood, with incidents from the two versions set down in alternating blocks. Similarly repetitious accounts, often extremely complex and hard to analyze, may be found in Exodus 24, where Moses seems to go up the holy mountain three times, and Joshua 3–4, in which the account of the crossing of the Jordan under Joshua's leadership is impossibly convoluted. Where two accounts or versions are closely similar in extent, they are often called a *doublet:* compare, for example, 2 Kgs 24:10–14 with 24:15–16, or Gen 37:21–22 with 37:26–27.

3. Stylistic Differences. Some OT books show extraordinary variations of style, ranging from a preference for particular words or phrases to peculiarities of grammar and syntax. In the Pentateuch, variation is particularly marked in Genesis and Exodus, where some sections are written in a lively narrative style akin to that of the books of Samuel, while others are marked by a stylized and repetitive manner, full of recurring formulas, lists, and technical terms. Compare, for example, the vivid narrative of Exodus 2—the childhood and early career of Moses—with the ponderous accounts of the building and equipping of the tent sanctuary in Exodus 36–40. Such variations in style can also be found in poetic books. Among the oracles in Jeremiah, for example, there are some (e.g., chapters 30 and 31) whose similarity to the style of Isaiah 40–55 (the so-called "Second Isaiah") is so close, and whose dissimilarity from the rest of Jeremiah is so great, that they seem likely to derive from a different hand than the rest of the book. Other chapters in Jeremiah, especially those in prose, seem close to the style of the Deuteronomistic History (Joshua–2 Kings). While an appreciation of stylistic difference is often to some extent subjective, the variations within books such as these are wide enough to make it unlikely that a

single author is responsible for all the material. English translations of the Bible tend to flatten out such differences by using a uniform "biblical English," but in the Hebrew they are easily detected.

D. Stages of Source-Critical Analysis

1. Breaking Up the Text. Source-critical analysis begins not with a quest for continuous sources, but with an analysis, into fragments, of each section of the biblical book under consideration. The source critic must note each point where there is a break, inconsistency, or discontinuity in the text, and so establish for each chapter how many different pieces of underlying material are present. In a comparatively simple case such as Genesis 1–2, most scholars are agreed that there are only two basic parts: 1:1–2:4a and 2:4b–25. Where there is interweaving, however, a more complicated picture may emerge: the Flood Narrative shows a change of source material every few verses. In the process of analysis, there will sometimes be very brief fragments which seem to derive, not from underlying materials, but from the editor who put the materials together. Such short "link passages" (e.g., "After these things …" in Gen 22:1, or "a second time" in 22:15) are *redactional*—they are necessitated by the juxtaposition of two originally separate stories by the redactor or editor. The study of these portions of text belongs to Redaction Criticism.

2. Reconstructing the Sources. Though some books of the OT may have been assembled from a host of tiny fragments and so are little more than anthologies, this process of growth seems unlikely for most of the narrative books of the Bible. For example, when the fragments into which the Pentateuch has been analyzed are examined, they group themselves naturally into a few piles, each marked by a very strong family resemblance. Thus the creation story of Gen 2:4b–25, the account of the building of the tent in Exodus 36–40, and the laws of Leviticus have so many points of style, expression, and theology in common that they probably derive from the same document. More strikingly still, when the fragments of the Flood Narrative are examined they prove to belong to two families, and if each family is joined up in the order in which its fragments occur in Genesis 6–9 the result is two more or less complete *parallel* accounts of the Flood, amounting to an extended doublet. Similarly the "pro-" and "antimonarchy" stories in 1 Samuel fall into two basic narratives which may derive from two sources, rather than a multitude of documents. Painstaking work along these lines resulted in the classic "four-source" hypothesis for the Pentateuch outlined above, according to which the whole work was assembled from only four underlying sources, three of them continuous, parallel accounts of the history of the world from creation to the death of Moses (J, E, P) and the fourth basically the book of Deuteronomy and some related narrative materials (D). Each of the four sources is marked by a uniform style, certain preferences of vocabulary and theme, and its own chronological framework. It is the unresolved clashes between the four, mutually incompatible presentations that make the Pentateuch so bewildering to the casual reader. See also YAHWIST (J) SOURCE; ELOHIST (E) SOURCE; PRIESTLY (P) SOURCE; DEUTERONOMY. Other books yield to the same kind of analysis. Thus scholars distinguish three or four basic kinds of material in Jeremiah, each of which may have had an independent existence as a self-contained work before being edited to produce the present book.

3. Dating the Sources. Relative dating of source-materials is sometimes possible, where it seems likely that one source-document was written by someone already familiar with another. Thus, in the case of the Pentateuch, it is sometimes argued that the P narrative of the events at Sinai presupposes an acquaintance with the J version and therefore must be later. Where there is no such presumption, however, the relative dating of sources depends, like their absolute dating, on external points of reference. One of the oldest critical observations in biblical studies was that certain verses in the Pentateuch could not be by Moses, because they presupposed a far later period. Thus the statement, "The Canaanite was then in the land" (Gen 12:6), can only have been written by someone living after the Canaanites had ceased to be in the land, that is, long after Joshua. But it has only been since the triumph of critical biblical scholarship in the 19th century that such arguments have been applied rigorously to the whole OT, with the result that many sources can now be given, if not firm dates, at least a *terminus post quem* and a *terminus ante quem*—earliest and latest possible dates.

E. Terminology

1. Alternative Terms. As noted above, "source criticism" is a comparatively recent term. Traditionally the critical study of the Bible was known as higher criticism wherever it ventured beyond the study of the transmission of the text. This term indicated that questions of a higher order were being asked—questions about the origins of the material, not just about the accuracy of its transmission by scribes; questions about the interrelation of large complexes of material; and questions about authorship and dating. There was also a general recognition that as criticism became "higher," less tied to purely "textual" matters, it became both more ambitious and also, inevitably, more speculative and hypothetical. If the term "higher criticism" had survived into this century, it would have included such disciplines as form and redaction criticism; the fact that we can now equate it with "source criticism" stems purely from the fact that this was the only form of higher, i.e., nontextual, criticism current when the term was still in general use. During the period when British biblical scholarship was generally hostile to source analysis of the Pentateuch and saw in it merely a liberal, rationalist "attack" on the inspiration of Scripture, "higher criticism" tended to be a term of abuse in English-speaking theology, and to be regarded contemptuously as a pretentious term. But the term was never intended to imply a moral or intellectual superiority, rather it merely indicated a method which built upon and went beyond textual criticism and was in that, non-evaluative sense, "higher."

Once biblical criticism developed techniques such as form, traditio-historical, and redaction criticism, the kind of higher criticism we have been calling source criticism became generally known as "literary criticism" *(Literarkritik).* The method was termed "literary" to emphasize that it concentrated on written documents, rather than on orally transmitted units or traditions. This usage continues in German-language works, but in the English-speaking world there has been an increasing sense that the term is misleading, because of the very different use of the term "literary" found in the secular study of literature. In Britain and North America "literary criticism" usually refers to the evaluative and interpretative study of literature, not to investigations into the origins or sources of a literary work. The term "source criticism" is therefore the preferred designation. It has its own disadvantages, however: "source criticism" can tend to imply that the critic's business is to discover sources, whereas in reality it is to discover whether a passage is composite, and is therefore composed of several sources, *or not.* The more neutral term "literary criticism" may therefore still be preferred, as not prejudging the results of the analysis.

2. The Word "Source." The modern use of "source" to mean one of the underlying documents detected in a biblical book by literary-critical analysis has an interesting history. We may distinguish three phases.

At the Reformation, theology began to share the particular concern of Renaissance scholars for authentic "sources," that is, genuinely early and authoritative texts to which appeal could be made as arbiters of what was authentic in matters of religion. In this sense, the Bible could be called the primary "source" for the Christian faith. In this usage, nothing was being said about the literary character of the biblical books.

After the Enlightenment, scholars began to think of the Bible as a source in a different sense: as important historical evidence from which the history of Israel or of the early church could be reconstructed. This is the sense in which 19th-century secular historians spoke of studying historical *sources,* meaning by this valuable primary documents; and when Wellhausen suggested that the Pentateuch consisted of four sources, he meant four sources for reconstructing the history of Israel and its institutions. If a history of Israel was to be written, it was essential to establish which were the primary sources of evidence—and the four-document hypothesis maintained that there were four such sources, rather than (as a superficial reading of the Pentateuch would suggest) only one.

Modern usage has moved from saying that the Pentateuch contains four historical sources (of information) to saying simply that the Pentateuch consists of four sources, thereby losing contact with the original reason for using this particular term, and treating it simply as a synonym for "underlying literary document."

NEW TESTAMENT

The term "source criticism" can be used in a very general as well as in a restricted sense. Used in the general sense, "source" is actually synonymous with "tradition," no matter how extensive it is or how it is handed down. Applied in the restricted sense, "source" refers to a written text that has been used by an author in his own writing. It is the task of NT source criticism to find out whether or not individual NT writers have made use of older written texts as sources. If the source in question is still extant (as in the case of Mark, a source used by Matthew and Luke), the task is confined to establishing the very fact that this writing was used as a source by another writer. If it is necessary to assume that an author used a source that is now lost, then, additionally, its size, structure, wording, and provenance need to be determined insofar as this is possible.

A. Results

When the use of sources in an individual book of the NT is established to a reasonable degree, it is possible to clarify the genesis of this book and to reach a better understanding of it. The literary and theological character of Matthew and Luke, for example, can be defined substantially better if these gospels are interpreted as further developments of Mark (and of Q).

At the same time we obtain a better knowledge of the different historical and theological developments to which the sources and the extant writings belong. Particularly if it is possible to determine a writing not known until now as a source of an extant writing, the knowledge of the history of the early church will be increased considerably. The reconstruction of the Sayings Source (Q), for example, reveals the fact that

the eschatological preaching in the Syro-Palestine area (from where Q is supposed to have come) obviously differed from that of Mark's gospel and its traditions.

B. Development of Source Criticism

The rise of source criticism is part of a fundamental change in the approach to the NT. It means not anything less than the attempt to cast off a dogmatical view of scripture in order to reach a historical understanding of the NT and the origins of Christianity. It is therefore no mere accident that source criticism arose in the Age of Enlightenment and reached its high-watermark in the 19th century. The problem posed by the close relationship between the first three gospels was the first battlefield of source criticism. It was solved by the so-called "Two-Source theory," according to which Matthew and Luke independently used the same two sources, namely Mark and (for the materials common to both Matthew and Luke but not derived from Mark) the so-called Sayings Source (Q). This theory has won almost general acceptance because it provides a rather simple explanation for the complex relationship between the Synoptic Gospels. See TWO-SOURCE HYPOTHESIS.

The intensive source critical work applied to the Synoptic Gospels was guided by the endeavor to gain a firm historical basis for the reconstruction of the life and preaching of Jesus. In a similar way, the analysis of Acts was undertaken out of historical interest. In this case, however, the different proposals have not led to convincing results and the question as to whether or not it is possible to detect sources behind some parts of Acts has remained very controversial until now.

Today, however, source criticism focuses on the literary process which can be traced beyond the extant texts of the NT. This applies to the gospel of John, the sources of which are intensively debated although they do not provide information concerning the historical Jesus. The sources made use of in Revelation are another example. Further fields of source criticism are the relationships of Colossians to Ephesians and of Jude to 2 Peter.

C. Methodological Problems

Simultaneously the methodological problems were intensively discussed. Principally there are two different reasons leading to the assumption of a source. First, there are similarities between two or three extant writings and the extent and nature of these similarities makes the use of common oral traditions improbable. In the case that the supposed source itself contained oral traditions, a decisive criterion is a common order of this material in these two or three writings. As far as the result of the investigation is concerned, two different solutions are possible: either one of the two (or three) writings was the very source of the other(s), or the writings related to each other had a common source, which is now lost. Second, there are discrepancies within one single writing which cannot be assigned to the independent work of a single author, and these discrepancies, on the other hand, cannot be explained by the use of oral traditions. In this case the assumption of a source by all means involves the hypothesis of a written document which is now lost.

The assumption of a lost text being used as a source depends on the following criteria, especially if the evidence is based on indications derived from one extant writing only:

(a) The traditional material included in an extant writing cannot be regarded to be transmitted orally either because of its size (e.g. the material common to Matthew and Luke lacking in Mark) or because of its literary structure (e.g. the "speech" of Stephen in Acts 7).

(b) This material forms a text which can reasonably be assumed to have been an independent writing; that is the case, if it reveals a literary structure and theological ideas fundamental to the whole body of material.

(c) In addition, insertions interrupting the body of the supposed source are clear indications for the use of a source. Such insertions point to the author of the extant writing, who is interpreting in this way an already written text.

(d) If the supposed source forms a collection of different traditions originally orally transmitted, a decisive criterion is the proving that there are editorial links or remarks which cannot be assigned to the author of the extant writing. Such editorial links or remarks point to an early stage of editorial activity, i.e.

to the editorial framework of the source (for an example for the last three criteria see the discussion of the Signs Source of the gospel of John, below).

(e) No definite evidence, however, can be drawn from differences of vocabulary and style, as any author is able to remold a written text (although not all NT writers do this), or, on the other hand, to adopt the style and vocabulary of a source in passages which he is going to write himself. Therefore, observations on different style and language can only have subsidiary importance.

The validity of these criteria is generally accepted, but their application is vehemently disputed in some cases.

D. The Synoptic Gospels

1. Mark as a Source for Matthew and Luke. The close relationship of the three Synoptic Gospels is based on two facts: (1) a bulk of material common to all three, or at least two, of the Synoptic Gospels, and (2) a common ordering of this material. See also SYNOPTIC PROBLEM.

About 35% of the material which is contained in the Synoptic Gospels is common to all of them. Because of the different extent of the three Synoptic Gospels the percentage of the common material differs considerably from gospel to gospel. The gospel of Mark consists to 85% of this common material, while the percentage in Matthew is 50% only, and in Luke is only 40%. Moreover, and this is very important, if one singles out these materials, there emerges a common order for it. As for the great majority of the materials, there is a common order in all three gospels and the rest is arranged in at least two of the gospels in the same way. Since this common order could not have been arrived at two or even three times anew, it can only be explained as the result of literary dependency: there must have been a source in which this common order of the material had once been established.

To identify this source, a more detailed analysis is necessary. Of special interest are those cases where the material common to all three gospels occurs in the same order only in two of them. Such a common order can be seen between Matthew and Mark (while Luke deviates: he reproduces the same material in another context), and between Luke and Mark (while Matthew deviates); however, there is no case where Matthew and Luke have a common order from which Mark deviates. This fact is explained best by the assumption that Mark presents the material common to all three gospels in exactly the same order in which it was also used by Matthew and Luke. Matthew and Luke changed (to a limited extent) the given order independently from each other and therefore never reached coinciding results. This leads to the conclusion that there was either a source common to all three gospels, which was identical with the gospel of Mark as far as the arrangement of the material is concerned, or that Mark itself was the source used by Matthew and Luke.

The hypothesis of the priority of Mark becomes a firm conclusion, if the differences of content are additionally taken into consideration. About 95% of Mark's material reappears in Matthew, 85% of it in Luke. Assuming Mark as the common source of Matthew and Luke, most of these omissions can be understood as resulting from the editorial aims of Matthew and Luke, respectively. However, if one considers—as does Farmer (1964)—Matthew as the source of Mark and thinks Mark to be the latest gospel making use of both Matthew and Luke, then one is faced with serious difficulties. But see TWO-GOSPEL HYPOTHESIS. Firstly it would be necessary to explain the differences between Matthew and Luke as being due to the editorial activities of Luke. This possibility is already ruled out if one tries to explain Matthew's Sermon on the Mount (Matthew 5–7) as source for Luke's Sermon on the Plain (Luke 6). Secondly it would be necessary to explain why Mark has taken up only 50% of the materials known to him from Matthew (or even only 40% of the materials contained in Luke), and why he has left out even the materials common to both Matthew and Luke, which include such prominent traditions as the Beatitudes and the Lord's Prayer.

The assumption of the priority of Mark is confirmed by the fact that in this way there emerges a comprehensible relationship between the three Synoptic Gospels, both in literary and theological respects. Matthew and Luke turn out to be further developments of Mark: literarily by prefixing the infancy narratives, by inserting the Sayings Source (see below), and by attaching the appearance narratives;

theologically by presenting a more elaborated ecclesiological concept (Matthew) or an advanced position in the development of early Christian eschatology (Luke).

2. A Pre-Markan or Deutero-Markan Gospel as a Source? The fact that four pericopes of Mark are missing in Matthew and Luke (Mark 3:20–21; 4:26–29; 7:31–37; 8:22–26) has led to the assumption that it was not the canonical gospel of Mark which was the source for Matthew and Luke, but rather an earlier version *("Ur-Markus")* which did not contain these texts. Similarly, the absence of Mark 6:45–8:26 in Luke has been explained by the assumption that Luke used a mutilated copy of the gospel of Mark (this would mean a Deutero-Mark). These assumptions, however, are precarious, because there are no reasons for these alleged developments of the gospel of Mark; on the other hand, most of these omissions can be explained as deliberate shortenings by Matthew and Luke.

One further observation, which led to the assumption of an *"Ur-Markus,*" concerns the so-called minor agreements, i.e., the variations of both Matthew and Luke concerning their *Vorlage* Mark. These agreements consist of (a) common shorter versions of the Markan material (Matt 17:14–21 and Luke 9:37–43a in comparison with Mark 9:14–29) and (b) positive agreements or versions which Luke and Matthew have in common against Mark (Matt 14:13 and Luke 9:11, "the crowds … followed him" while Mark 6:33 differs).

Most of these shorter versions, however, can be explained as abridgments of Mark made by Matthew and Luke independently. The extent of positive agreements is very limited in all cases. Most of these agreements can be seen as improvements resulting from the editorial activities of Matthew and Luke, which being similar to each other produced, in some cases, a similar wording. Otherwise it would be necessary to suppose that the postulated *Ur-Markus* has undergone a process of deterioration after having been used by Matthew and Luke. Besides, one will have to take into account the possibility that in some cases Matthew and Luke were aware of a slightly different version of Mark's material transmitted by oral tradition and that they to some extent preferred this to Mark's text.

3. Pre-Markan Sources. Often it is argued that Mark itself made use of orally transmitted collections of materials or shorter written sources for some parts of his gospel: (a) controversies, Mark 2:1–3:6; (b) parables, Mark 4:1–34; (c) miracle stories, Mark 4:35–8:26; (d) pronouncement stories, Mark 11+12; (e) apocalyptic discourse, Mark 13; (f) Passion narrative, Mark 14:1–16:8.

In all of these cases, however, there is no indisputable evidence. As far as Mark 4:35–8:26 and 11+12 are concerned, positive arguments are lacking altogether. As to Mark 2:1–3:6 and 4:1–34, the assumption of sources depends on the question as to whether or not Mark 3:6 (or 2:27) and 4:10–12 (and 4:33–34) are editorial remarks (or adaptations of such remarks) that can be distinguished from Mark's own editorial framework. In any case, however, the arrangement of the traditional material in Mark 2–8 and 11+12 can be understood without the assumption of written sources. On the other hand, the impression cannot be rejected that Mark often adapts his material as if he would be making use of it in written form (cf. the technique of "sandwiching" in Mark 5:21–24/25–34/35–43); for explaining this, however, it is more appropriate to assume that Mark himself, while collecting his materials, first wrote them down separately before inserting them in the framework of his gospel.

As far as Mark 13 is concerned, it is discussed as to whether or not Mark made use of a short Jewish source, which is supposed (Hölscher 1933) to have been an apocalyptic pamphlet from the year A.D. 44. The proof depends on three problems: (a) The historical events alluded to: Can they be understood more easily as elements of an earlier source or as parts of a text written by Mark on his own account? (b) The reconstruction of the source: Do the parts of Mark 13, which are supposed to be derived from the source, form a literary unit which can have existed as an independent writing? (c) The structure of Mark 13: Is it easier to be comprehended if the use of a source is assumed? There are sound reasons to answering these questions in the affirmative, especially if one argues (Brandenburger 1984) for the origin of this source from Judeo-Christian circles during the Jewish war (ca. A.D. 68/69).

The Passion narrative of the gospel of Mark (Mark 14:1–16:8) has undergone a complicated process of development, but there is no agreement between the different proposals to explain this process.

Accordingly it is a completely open question as to whether or not the pre-Markan Passion narrative was a written document. See also PASSION NARRATIVES.

4. The Sayings Source (Q). After accepting the proof that Mark was used as a source by Matthew and Luke, there remains the task of explaining the agreements between Matthew and Luke which go beyond Mark's material. A source has to be assumed for this material, too. If one singles out the material common to both Matthew and Luke but without counterpart in Mark, one obtains a common sequence of at least 13 passages out of 24 (nos. 1–5, 8–9, 12–13, 15, 21, 13–24 of the list below), which contain more than 50% of the whole material. A common sequence like this could not have been arrived at independently by Matthew and Luke.

Since a direct literary relationship between both gospels is ruled out by the assumption that Mark has been used by Matthew and Luke independently, there remains only one solution, viz. to suppose a second source consisting of sayings and some pronouncement stories, commonly labelled as Q. See Q (GOSPEL SOURCE).

The analysis of the Sayings Source has arrived at the following widely accepted consensus. First, for methodological reasons the size has to be limited to the pericopes which are contained in both Matthew and Luke. It cannot be ruled out, however, that one of the two evangelists has omitted some materials contained in Q (that means that some texts from the material peculiar to Matthew or Luke would belong to Q, too), but it can hardly be definitely proven either. The woes in Luke 6:24–26 which are lacking in Matthew 5 are a case in point. Second, insofar as Matthew and Luke are not in agreement, the disposition of Q has to be reconstructed rather from Luke, because Matthew often changes the arrangement in order to compile longer speeches (cf. the insertion of the Lord's Prayer and other Q materials into the Sermon on the Mount). Third, the wording has to be examined in every case to determine whether Matthew or Luke has preserved it more precisely.

According to the order of the material in Luke, the Sayings Source can be reconstructed in the following way:

1. Luke 3:7–9, 16–17 = Matt 3:7–12 John's Eschatological Preaching
2. Luke 4:2–13 = Matt 4:2–11 The Temptation of Jesus
3. Luke 6:20–23, 27–49 = Matt 5:3–6, 11–12, 38–48; 7:1–5, 15–27 The Sermon on the Plain/on the Mount.
4. Luke 7:1–10 = Matt 8:5–13 The Centurion of Capernaum
5. Luke 7:18–35 = Matt 11:2–19 John the Baptist and Jesus
6. Luke 9:57–60 = Matt 8:19–22 On Following Jesus
7. Luke 10:1–12 = Matt 9:37–10:15 Commissioning of the Disciples
8. Luke 10:13–15 = Matt 11:20–24 Woes to Unrepentant Cities
9. Luke 10:21–24 = Matt 11:25–27; 13:16–17 Jesus' Thanksgiving to the Father and The Blessing of the Disciples
10. Luke 11:1–4 = Matt 6:9–13 The Lord's Prayer
11. Luke 11:9–13 = Matt 7:7–11 Encouragement to Pray
12. Luke 11:14–23 = Matt 12:22–30 The Beelzebul Controversy
13. Luke 11:24–26 = Matt 12:43–45 The Return of the Evil Spirit
14. Luke 11:29–32 = Matt 12:38–42 The Sign of Jonah
15. Luke 11:39–52 = Matt 23:4, 23–25, 29–36 Discourse against the Pharisees
16. Luke 12:2–9, 10 = Matt 10:26–33; 12:32 On Confession and Blasphemy
17. Luke 12:22–31, 33–34 = Matt 6:25–33, 19–21 Various Sayings
18. Luke 12:39–40, 42–46 = Matt 24:43–51 The Parables of the Householder and of the Faithful Servant
19. Luke 13:18–21 = Matt 13:31–33 The Parables of the Mustard Seed and of the Leaven
20. Luke 13:24, 26–27, 28–29 = Matt 7:13–14, 22–23; 8:11 Eschatological Sayings
21. Luke 13:34–35 = Matt 23:37–39 The Lament on Jerusalem
22. Luke 14:16–24 = Matt 22:1–10 The Parable of the Great Banquet

23. Luke 17:23–24, 26–27, 30, 34–35 = Matt 24:26–27, 37–41 Final Apocalyptical Sayings
24. Luke 19:12–27 = Matt 25:14–30 The Parable of the Pounds.

In Matthew the material derived from Q is often closely interwoven with material only found in Matthew (Matthew's *Sondergut*). This has led to the assumption that Matthew was familiar with Q in a further-developed version than was available to Luke. However, one has to take into account the fact that Matthew usually reshaped his material to a great extent (cf. the conflation of Jesus' speech of the commissioning of the disciples from Mark 6:7–13 and Q [Luke 10:1–12] in Matt 10:1–16). This weakens the possibility of substantiating the theory of a special version of Q earlier than Matthew and unknown to Luke.

Q is a collection of sayings, including some parables, controversies, and pronouncement stories, whereas narratives are lacking almost completely. Insofar it is to be compared with the Jewish wisdom literature (Proverbs, Ben-Sirach, Wisdom of Solomon), and it has a later parallel in the *Gospel of Thomas.* But there are differences, too, resulting from content. Q presents the authoritative teaching of the Son of Man, who will arrive to act as judge and savior (Luke 12:2–9 = Matt 10:26–33; Matt 24:43–44 = Luke 12:39–40). His preaching is, therefore, no mere teaching of human wisdom, but divine revelation, which is superior even to all former prophecy (Luke 10:21–24 = Matt 11:25–27; 13:16–17), and his disciples are instructed to proclaim this very teaching (Luke 10:1–12, 16/Matt 9:37–38; 10:7–16, 40).

Accordingly, Q opens, after the eschatological preaching of the Baptist and the temptation of Jesus, with the authoritative promise of salvation for the poor (Luke 6:20–23 = Matt 5:3–6, 11–12) and closes with a broad eschatological outlook. It is an astonishing feature that the Passion seems to have been ignored completely in Q. Indeed, Q does not contain a soteriological interpretation of Jesus' suffering and death; but Jesus' suffering is present, nevertheless: it is interpreted according to the fate and the murdering of the prophets (Luke 13:34–35 = Matt 23:37–39). The stress, however, lies on his coming as the Son of Man, on his future role as judge and savior.

This question of the historical and geographical setting of Q can only be answered by inferences. One has to distinguish between the age of the individual traditions and the time of the source's composition. In any case it is clear that the traditions are not homogeneous (Luke 4:2–13 = Matt 4:2–11; Luke 10:21–24 = Matt 11:25–27; 13:16–17 can all be considered as younger traditions), which is an argument against a too-early dating. This is corroborated by the polemic attitude against "this generation" pointing to an increasing distance to Israel, and the positive view of the gentiles (Luke 7:1–10 = Matt 8:5–13; Luke 11:29–32 = Matt 12:38–42). Therefore, the composition is generally dated between A.D. 50 and 70. Judging from the rural features of many Q traditions, most scholars argue for the N part of Palestine and the S part of Syria as being its place of origin.

5. Other Sources for the Synoptic Gospels. For the materials which cannot be traced to either Mark or Q, the existence of other sources has also been considered. B. H. Streeter (1924) presumes a separate source for Matthew's *Sondergut* ("M"); and as to Luke, he thinks that Luke has at first combined Q with the Lukan *Sondergut* ("L") to form a "Proto-Luke," into which he later incorporated Mark. Neither from "M," however, nor from the alleged combination Q and "L," can there be a comprehensive source reconstructed.

In the case of Luke's Passion narrative, which in parts differs clearly from Mark, there are no sufficient arguments to assume a special source. More appropriate is the assumption that some parts of the Lukan Passion narrative are derived from orally transmitted versions circulating in Luke's congregations differing to some extent from the narrative taken up by Mark.

Finally it has to be stressed that the Two-Source theory has to be regarded as a hypothesis; but all other theories concerning the interrelationship between the Synoptic Gospels are also hypotheses. No hypothesis can solve all aspects of such a complicated question in a totally satisfactory way, but an alternative hypothesis will only gain wider acceptance, if it is able to excel the Two-Source theory, i.e. if it can solve the questions still unsettled without raising other and more difficult problems.

E. The Gospel of John

1. The Signs Source. The assumption that the seven miracle stories of John are derived from a special source has been widely approved. Arguments in favor of this source are: (1) The numbering of the two miracles in John 2:11 and 4:54, and especially the fact that 4:46–53 is counted in 4:54 as Jesus' second miracle, although the evangelist mentions other miracles already in 2:23. (2) The editorial transitional phrase in 2:12a, which is without function in its present context and obviously was intended originally to connect the first two miracle stories (2:1–11 and 4:46–54). (3) Insertions by the evangelist in the miracle stories which lead to the assumption of a written *Vorlage* (especially clear in 4:48; cf. also 6:4, 6). (4) The conclusion of the gospel of John in 20:30–31a, which cannot be understood as a summary of the whole ministry of Jesus by the evangelist, because the speeches and Passion of Jesus are nowhere else called *sēmeia.* Here the author of the gospel has made use of the conclusion of a source, consisting of *sēmeia* (= signs), i.e., of miracle stories. (5) The critical attitude of the evangelist towards the view that faith is based on miracles (4:48; 6:26–35), which is incompatible with the view put forward in the single traditions (4:53) and in editorial remarks not deriving from the evangelist (2:11; 20:31a). Since the miracles are called *sēmeia* in the editorial framework of the source, the term Signs Source has become common. See SIGNS/SEMEIA SOURCE.

The size of the Signs Source is fiercely debated. Basically there are three possibilities. The first is a minimal solution, according to which the source consisted exclusively of the seven miracle stories and a limited editorial framework (John 2:11–12a; 4:54; 12:37–38; 20:30–31a). The second is a midway solution, according to which the source contained additionally some further materials like the traditional layer of John 1:35–51 and 4:1–42. As far as the history of these traditions is concerned, there is a close relationship between these materials and the miracle stories; this relationship, however, does not prove that these materials are derived from the same source. The additional argument that the mentioning of the disciples in 2:1 presupposes a story that tells how they became Jesus' followers is not compelling. Third is a maximal solution: the source additionally contained a Passion narrative so that it was a gospel resembling the Synoptics. In this case, however, John 20:30–31a cannot be claimed as the end of the source, and the source itself cannot be labeled "Signs Source" any longer. As far as the theology of the source is concerned, it is difficult to see how this alleged source solved the tension between the miracles which have become much more marvelous (cf. John 11) on the one hand and Jesus' suffering and death on the other hand.

If one opts for the minimal solution, one obtains a distinct profile of the source: It contained seven miracle stories, each of them representing a different type of miracle. This is an argument in favor of the assumption that the source has been incorporated *completely* into the gospel of John. (A striking difference to the Synoptics is the fact that the Signs Source did not contain an exorcism.) The sequence appears to be the result of a conscious composition: at the beginning there is a miracle revealing Jesus' power over inanimate nature (2:1–11), which leads to the disciples' faith, and at the end occurs a (massively enhanced) resurrection story (chap. 11).

The intention of the source is clearly expressed in 20:30–31a: The collection of miracle stories is intended to cause faith in Jesus as the Son of God because of his mighty deeds (2:11); but the source is aware of the fact that miracles may be rejected (12:37–38).

The selection of seven miracle stories, each representing a different type of miracle, and the fact that the miracles have become much more marvelous (in comparison with the Synoptics) point to a later date of origin. Whether names of places as in 1:28 and 10:40 (Peraea) or in 4:1 (Samaria) have something to do with the source's provenance depends on the question as to whether or not these remarks can be assigned to the source.

2. A Source for the Speeches? Regarding the speeches of John, the use of a source has also been discussed. R. Bultmann (1971) argued for the use of a gnostic writing consisting of speeches by the gnostic redeemer revealing his own mission; these were critically interpreted by the evangelist. The arguments in favor of this far-reaching hypothesis are now very doubtful, however. The stylistic differences within the speeches of the gospel of John (between poetic and more prosaic sentences) are not sufficient as proof, and that a gnostic writing already existed in the 1st century A.D. is extremely unlikely.

Additionally, Bultmann is often forced to rearrange the sequence of the sentences within the speeches of the gospel of John in order to reconstruct the supposed source. However, the difficulties in the composition of these speeches are obvious and call for further explanation.

3. The Problem of a Passion Source. The close relationship between John 18–20 and Mark 14:1–16:8 (and the additional agreements with Luke 22–24) shows that John is dependent here on a given tradition which he adapted. However, this seems to have been not a written source, but rather a relatively stable oral tradition closely related to the Markan Passion narrative. Additionally, this tradition was influenced by the written version of Luke 22–24 (which does not imply that the author has made use of Luke 22–24 directly). One has to take into account an intensive redaction at central points as well (e.g. John 18:28–19:16).

F. Book of Acts

It cannot be doubted that Luke has made use of traditional material on a great scale in Acts, but there are evidently no continuous sources behind Acts 1–12. All attempts to reconstruct such sources (referring to the development of the congregations in Jerusalem and Antioch) have led to no convincing result. A special problem is posed by the speech of Stephen (Acts 7). It interrupts not only the continuity between Acts 6:8–15 and 7:54–60, but it is also not Lukan, as is shown by the comparison with Acts 13:17–25, where Luke develops his own contrasting view of the history of Israel. Moreover, Luke breaks off the rendering of his tradition in Acts 7:48 abruptly (cf. 17:24). It is more difficult to answer the additional question as to whether or not Luke has expanded his source by way of insertions (possibly in 7:35, 37, 42b–43). The rough transition from 7:47 to 7:48 and the possible Lukan insertions point to the use of a written source. The critical review of God's election and Israel's disobedience shows that the source shares the Deuteronomistic view of history, although it is probable that it was written by a (Judeo-) Christian author. The fact that it has been assigned to Stephen may indicate that Luke got to know it as an Antiochene tradition.

In relation to Acts 13–28 two sources are discussed: (a) a source of the so-called "we sections" (in Acts 16; 20+21; 27–28), and (b) an itinerary source for the names of the places to which Paul came during his travels.

Both assumptions lead to considerable difficulties. First, the "we sections" do not point to a continuous source, for they only contain sea voyages. If one thought of a source (the journal of an eyewitness?), one would have to assume that Luke has reshaped all parts not bearing on sea voyages. In this case, however, the contrary assumption is more probable, viz. that it was Luke himself who has introduced the "we" into his narrative. This is a common literary device in describing sea voyages in Hellenistic romance literature.

Second, if an itinerary has been used, one either has to assume that it was of a very disparate character or that Luke has shortened it considerably (cf. the roughly sketched journeys in Acts 16:6–8 and 18:20–23 with 16:11–12 and 20:6, 13–15; 21:1–18). However if one restricts the assumption of an itinerary to Acts 20:4–21:15, a positive proof seems to be possible. The list of names in 20:4 is pre-Lukan, because it is only here in Acts that Paul is surrounded by such a delegation, and Luke does not give any reason for this escort. Only if one takes into account 1 Corinthians 16 and 2 Corinthians 8 and 9, does the purpose become clear: The delegation has the task of delivering the collection to Jerusalem, a fact known to Luke (24:17) but suppressed almost completely. The list of harbors and islands in Acts 20:6–21:15 (the only real itinerary in Acts) also seems therefore to be pre-Lukan. It is not unlikely that Luke has used a report of the journey written down by a member of the delegation some time after their return. Some single items of 20:4–21:15 can also be attributed to this source (21:8–9, but not 20:8–35). The source will certainly have reported something about the result of the journey (the delivery of the collection), but Luke has omitted this theme almost completely, so only speculations are possible. It is not astonishing, by the way, that this source, being the report of a delegation, was written in the "we form"; this might have also caused Luke to put other sea voyages in the we form. See also Jackson and Lake 1922:121–75.

G. Sources Within the Epistles

Colossians and Ephesians have very close affinities; and if one assumes that at least Ephesians is Deutero-Pauline (Colossians is probably also Deutero-Pauline), one has to accept a literary dependence:

One-third of the vocabulary of Colossians appears also in Ephesians, whereas 73 of the 155 verses of Ephesians have a counterpart in Colossians. (Especially in Eph 2:1–3:19, the affinities to Colossians are very close.) Ephesians presupposes the understanding of important terms like *sōma* (body), *kephalē* (head), *mystērion* (mystery), *oikonomia* (office), peculiar to Colossians, and develops them further. Instances in favor of a direct literary dependence are phrases of Ephesians which can only be explained by assuming that they were taken over from Colossians (for examples, see Kümmel 1975:340–46, 358–60). Colossians is therefore to be seen as the source adapted by the author of Ephesians and remolded to a great extent.

Likewise, the affinities between 2 Peter 2 and Jude 4–13 (2 Peter 2:10–12, 17 with Jude 10, 12–13) are so close that a literary dependence has to be reckoned with: 2 Peter incorporated the shorter Jude; the author of 2 Peter has polished his source in parts and has omitted offensive points, such as the quotation from the apocryphal book of *Enoch* in Jude 14–15.

H. The Book of Revelation

The numerous difficulties of Revelation have caused many attempts to prove the use of sources in order to explain its complicated composition. In the visions of the seven seals and of the seven trumpets there is, in each case, one larger interruption (Revelation 7; 10:1–11, 14). As an explanation for these interruptions, as well as for chapters 12 and 17, the use of sources has been assumed. Farther-reaching hypotheses take into account a Jewish *Grundschrift* (basic writing), which has been adapted by a Christian author; or two different versions by one and the same author which have been interwoven only superficially. It cannot be disputed that the author has made use of very different materials in many cases, but until now not even a limited agreement could be reached concerning the differing proposals. If written sources are to be assumed at all, they are of rather limited size and have been reworked intensively by the author to a degree that a differentiation between sources and orally transmitted traditions is hardly possible.

SOUTH. One of the cardinal compass points in Hebrew and most ANE cultures. Several different words in Hebrew expressed the direction south (S). The Hebrew word *yāmîn* literally means right or right hand. It is frequently used as the direction S because of the typical Hebrew means of orientation. The Hebrew would face E and get his orientation from his body: E was in front of him, W was behind him, N was to his left, and S was to his right. See also DIRECTION AND ORIENTATION. A good example of this use is Ezek 16:46 which speaks of those living to the N *(śĕmō‹l)* and to the S *(yāmîn).* Ps 89:13—Eng v 12 states that Yahweh has created the N *(ṣāpôn)* and the S *(yāmîn).* From the same Hebrew root comes the word *tēmān* used frequently as the direction S, but also used at times as a proper name, Teman, an area in the S, in Edom.

Two other terms are sometimes used to describe regions in the S, *negeb* (or *negbâ*) and *midbār.* These two terms refer to the conditions of the region: dry (or parched) and desert, respectively. Neither term was used exclusively to refer to the direction S however. The term Negeb came to refer to the entire S region of Israel from approximately Beer-sheba and Arad southward. That *negeb* was not limited to a region in the S of Israel is clear from its use to refer to a land S of Babylon (Isa 21:1) and to Egypt (Daniel 11). *Midbār* referred quite often to the wilderness of the Wandering period (Numbers 14), primarily the Sinai region, and to the Arabian desert (Judg 11:22), both of which were in the S. Additional uses of *midbār* refer to the desert/wilderness condition rather than direction.

S is often used in conjunction with the other cardinal compass points, N, E, and W (cf. Gen 13:14; 28:14) to indicate directions or expanse. At times S is used to refer to a particular position or object: i.e., south of a designated object. Often the pair N and S are used together as a merism to indicate a totality, especially in the phrase, "from north to south" (Ezek 20:47; 21:4).

In a more theological meaning, S can be the direction from which God comes or appears (Hab 3:3; cf. Deut 33:2; Judg 5:4). Some translators understand *tēmān* in this instance to refer to a particular place, and hence a proper name; others assume the word refers to the direction "south." Since no other passage relates Yahweh to the particular place Teman, it seems preferable to understand the reference to the direction, since other passages speak of Yahweh coming from Sinai and Paran (around Kadesh-Barnea), both locations to the S of the kingdom Israel. A parallel can be seen in the reference to God dwelling in the far N (Isa 14:13), probably influenced by Canaanite religion. See NORTH.

JOEL F. DRINKARD, JR.

SOUTH ARABIA, RELIGION OF. Our knowledge of the South Arabian paganism rests predominantly on archaeological data and on the contents of some thousands of monumental stone inscriptions (many of them fragmentary), relating constructions and dedications to the gods. They are solemn texts, drawn up in the third person. Their contents is not comparable, in volume and variety, to the documents found in Mesopotamia and Egypt, which include mythological and other literary texts as well as personal archives and private letters. Only two short hymns are known from South Arabian inscriptions, but the recent discovery of private texts scratched on wooden sticks indicates that other kinds of written documents were in use and may soon enrich our sources on religion.

The original South Arabian notion of the state was theocratic and expressed through the formula "National god, ruler, nation," for instance in Saba: "Almaqah (the national god), Karib'il (name of the king) and Saba." In ancient times the ruler might call himself the "firstborn" *(bikr)* of the god, while the nation was the "progeny" *(wld)* of its national god.

A. The Pantheon
B. The Temples
C. Magic and Funerary Customs
D. The Monotheistic Religions

———

A. The Pantheon

The South Arabian pantheon rested originally on an astral basis, as is shown by such divine names as Šams, "sun"; Rubʿ, " (moon) Quarter"; ʿAṯtar, a god whose name corresponds to that of the Assyro-Babylonian goddess Ištar, identified with Venus. But it remains unclear if those astral identifications were still really perceived as such. Many deities are known only under a vague denomination which does not reveal their nature nor even their sex. Some divine denominations give scattered evidence on theogonic myths: a goddess is named "mother of ʿAṯtar, " another one "mother of (the) goddesses"; there are "daughters of (the god) Il," and finally a "son of (the goddess) Hawbas."

In historical times, the male god ʿAṯtar, apparently identified with the planet Venus, was the supreme god: all the South Arabian nations venerated him under the same name and he takes the first place in enumerations of several gods. He had superseded the primitive supreme god of the Semites, ʾIl or ʾEl, who plays only a secondary role in the South Arabian religion. ʿAṯtar was the god of the natural irrigation by rain, in contrast to the artificial irrigation of the arid zones, which depended on rainwater fallen elsewhere and conveyed and distributed by an irrigation network. This could explain a distinction between two kinds of Sabaean lands in the first centuries A.D.: the "domain *(mulk)* of ʿAṯtar," in contrast to that "of Almaqah," the national god of Saba.

The gazelle, the symbol animal of ʿAṯtar, was the object of a sacred hunt in honor of ʿAṯtar and Kurūm," performed by the ancient rulers and kings of Saba. Kurūm certainly equals "Attarquruma," a North Arabian idol mentioned in the annals of Assyrian kings. As a god of thunder and thunderstorm, ʿAṯtar, qualified as *Šarīqān*, "the eastern one" (probably Venus as the Morning Star) was invoked in the epitaphs as an avenger of the violators of sepulchers. ʿAṯtar is frequently named with the goddess Hawbas, probably his consort, also named in Sabaean inscriptions of the 5th–4th centuries in Ethiopia, where her symbol was the vulva.

Along with the main god ʿAṯtar, each of the major kingdoms venerated its own national god. In Saba this was the god named Almaqah (or Ilmuqah), whose principal temple was near Mārib, the capital of Saba, a federal shrine of the Sabaean tribes. According to the widely contested old theory of the Danish scholar D. Nielsen, who reduced the whole South Arabian pantheon to a primitive triad: father Moon, mother Sun (sun is feminine in Arabic) and son Venus, Almaqah was until recently considered a moon god, but Garbini and Pirenne have shown that the bull's head and the vine motif associated with him are solar and dionysiac attributes. He was therefore a sun god, the male counterpart of the sun goddess Šams, who was also venerated in Saba, but as a tutelary goddess of the royal dynasty. Among other Sabaean feminine denominations, that of *dāt-Baʿdān,* a goddess who received dedications of votive statuettes of horses, was probably a sun goddess, since the horse generally is associated with the solar cult in the Mediterranean culture. In Maʿīn, the national god Wadd, "love," originated from North Arabia. The protective formula *Waddʾāb,* "Wadd is father," written on amulets or on the walls of the buildings, is frequently associated with the symbol of the moon crescent and a small disc (the planet Venus?), so that he probably was a moon god. In the Ḥadhramawt the national god, lord of the main temple of the capital city, Shabwa, was *Syn* (Sīn?), probably a sun god; his symbol animal, figured on coins, was the eagle—a solar animal. In Qatabān, the national god was ʿAmm, "paternal uncle," a well known Semitic divine name. There is no good reason to consider him a moon god. The sun goddess Šams was also venerated in Qatabān. In Ḥimyar, Šams was the national goddess, venerated at the rock sanctuary at al-Miʿsāl, near the site of the ancient city of Waʿlān.

Among the other local gods, many are known only through epithets which do not reveal their nature. The better known are listed here. In Qatabān, the gods Anbay and Ḥawkam are invoked together as (the gods) "of the order and of the decision." The name Anbay, probably derived from a root meaning "to speak, to prophesy," is comparable to that of the Babylonian god Nabū, identified with the planet Mercury. The name Ḥawkam belongs to the root meaning "to be wise." Both gods probably personified two aspects (as evening and morning star?) of Nabū-Mercury, the god of fate and science, spokesman of the gods, in the Assyro-Babylonian religion. In the Ḥadhramawt Ḥawl probably was a moon god: his name expresses the idea of a recurrent movement, suggestive of the cycle of the moon, to be compared

with the Qatabanian god Waraḫ, "month," and to such Sabaean divine names as Rubʿ or Rubʿ Šahar, "moon quarter."

Some tribes or tribal confederations had their own tribal *šym,* "patron." In Saba, Taʾlab ("ibex") of Riyām (a mountain now called Itwa, N of Ṣanʿāʾ), was the patron of Sumʿay, a confederation of tribes in Central Yemen. His sanctuary, on top of the mountain, was the center of an important pilgrimage. In the kingdom of Maʿīn, the patron god Nikraḥ was venerated on an isolated hill close to the ancient city of Yatil, nowadays called Barāqish. He was a healer patron: inscriptions found there reveal that his sanctuary was an asylum to dying people, or to women in childbirth or who had aborted. In votive inscriptions they confessed their sins against ritual purity. In the plain around the hill, nine inscribed pillars were found, each bearing the same text: "marker of this sanctuary." They served to mark the sacred perimeter of the sanctuary. Some tutelary deities called *Munaḍḍihāt* were called upon to protect the irrigation systems. Lares gods were invoked as "Lord of the house (or family)."

Next to Wadd, other North or Central Arabian gods were locally venerated in South Arabia. Bedouin caravaneers in North Yemen offered statuettes of camels to *dū-Samāwī,* "the heavenly one," a god from Central Arabia, for the well-being of their camels. Qatabanian women dedicated inscribed clay feminine figurines to the so-called "Daughters of Il," who correspond to the "Daughters of Allah" of pre-Islamic Mecca: the goddesses al-Lāt, alʿUzzā and Manāt alluded to in the Koran. The first two appear also on South Arabian amulets.

The South Arabian gods are above all represented by their respective animal symbol: bull, snake, eagle, lion, ibex, etc., but also by particular symbols similar to those in use in the Assyro-Babylonian religion—thunderbolt, club, door flap, arrow, etc. Less frequently they appear in anthropomorphic form (or as winged angels) in funerary reliefs or in statuettes as a young male deity or as a fertility goddess with cornucopia, sitting on a throne. Many traces have been recognized of syncretic influences of oriental cults of the Roman Empire; statuettes or reliefs have been found of Dionysios-Sabazios, Harpocrates, Dioscures riding a lion, Janus trifrons, etc., but the inscriptions never give the name under which such gods were known in South Arabia. Various reliefs show clearly an influence of Indian religious motifs.

B. The Temples

The sanctuaries consisted essentially of a sacred, open precinct *(ḥaram* or *maḥram),* accessible only on conditions of ritual purity. Expiatory confessions inform us as to the details of those rules. Women accuse themselves of having entered the temple during their menses. Men confess having had sexual relations with menstruating women, or women in childbirth, or of having omitted the ritual washing after sexual relations. Such rules, borne out by inscriptions several centuries older than the birth of Islam but using technical terms identical or very close to those of the Muslim jurisprudence, obviously were part of an ancient common Semitic heritage. There is therefore no reason to assume—as some islamologists have done—that the similar Islamic rules were borrowed from the Jews in Medīna, instead of being a mere survival of pre-Islamic Arabian usages.

The South Arabian temples show various forms derived from the pre-Islamic *ḥaram:* a precinct, mostly rectangular, in which a sort of canopy supported by four pillars may have sheltered the statue of the god and/or an altar for sacrifices. A rather primitive form of temple is that of the temple of Almaqah near Mārib, which must date back to the 5th century B.C. It consisted of a large elliptical precinct of approximately 110 m of great axis, surrounded by a powerful wall more than 8 m high and 4 m thick. A small rectangular temple of later date is embedded into the precinct, to which it served as an entrance hall. That smaller temple was excavated in 1951–52 by American archaeologists. The entrance between two pylons was preceded by six pillars bound by an architrave. The sanctuary consisted of a rectangular court surrounded by a portico with pillars, within which numerous stone slabs were erected, inscribed with dedications of statuettes (now missing). In several ancient temples of the Jawf (in the N part of North Yemen), the peristyle consists of low pillars bearing horizontal stone beams supporting broad slabs forming a ceiling. The internal surface of the pillars and of the ceiling bear an incised ornementation of motifs associated with the ritual hunt.

In the Ḥadhramawt, a series of ancient temples present the common structure of a single (or double) small rectangular cella built on a terrace overlooking the ancient settlement. The shrine is reached by a long flight of stairs up to 70 m in length. Finally, rock sanctuaries like the one at al-Miʿsāl in Ḥimyar, are high places, roughly fitted out on a natural terrace on a particularly imposing rock outcrop. Some mountain tops in Yemen are crowned by such sanctuaries.

The temples played an important role in public life. Each place of importance had its temple or temples, dedicated to one or to several gods. No temple archives have been recovered yet, but the main temples were certainly the centers of the administration in charge of the properties of the god and of collecting the sacred tithe. A stone copy of important acts was kept in the courtyard of the temples. The temples were managed by various kinds of priests and administrators *(ršw, śḥr, qyn, šwʿ)* directly attached to the service of the god, but whose functions are not clearly distinguished. Ancient rulers, for instance in Qatabān, bore priestly titles. Certain priests (*ršw,* and *śḥr)* formed a hereditary caste. They played a role in the interpretation or oracles, and in collective official sacrifices. In Saba, a caste of priests *(ršw)* of ʿAṯtar were recruited on a hereditary basis from three separate clans, each of which supplied in turn an eponymous priest, called *kabīr*, who remained up to seven years in office. The official acts were dated according to the year of office of that eponym, who was in charge of the collection and allocation of the proceeds of the tithe, and performed the magical practices aimed at obtaining rain. Elsewhere in South Arabia a similar institution was limited to two years.

The cultic utensils consisted of bronze receptacles and various kinds of bronze or stone altars: *madbaḥat* for sacrifices of animals; *maslam* used for libations and as incense burners, and *mqṭr*, incense burners. The *madbaḥat* and *maslam* are generally in the form of a stone table with a hollowed-out shallow basin, extended by one or two gutters ending with a bull's head. Numerous incense burners testify to the importance of aromatic fumigations as a rite against evil influences or in order to obtain a favor from the gods. The incense burners in stone have the form of a piedouche supporting a cube with a hollowed out upper surface, or of a small four-legged parallelepiped, bearing the name of a different aromatic on each of its sides. Many small incense burners of that type belong to the furniture of tombs or were used for the domestic cult.

The slaughter of animals as a sacrifice of expiation or of thanksgiving was probably, as in the Islamic cult, an individual rite performed by the faithful himself. But collective sacrifices took place in connexion with the pilgrimages, and—along with the burning of aromatics—at the inauguration of public buildings. The sacrifice of animals normally implies a rite of communion under the form of ritual meals. The offering of a ritual meal *ʾlm* or *mʾlm* (which reminds one of the Islamic *walīma,* a meritorious banquet), in honor of ʿAṯtar, appears in the texts as a rite performed by several ancient rulers of Saba. In a rock inscription which states the rules of the pilgrimage to his sanctuary in Riyām, the patron god Taʾlab orders banquets *(ʾlm)* to be drawn out from the proceeds of the tithe *(ʿušr)* due to him. Pliny (*H.N.* 12.63) remarks concerning the temple of Shabwa in the Ḥadhramawt that the sun god Sabin (probably Sīn) entertained his guests a number of days every year on the proceeds of the tithe. That pilgrimage in Shabwa is also mentioned in a Sabaean text. A similar pilgrimage took place in the month of Abhay at the shrine of Almaqah near Mārib.

In 1981 the French Archaeological Mission in North Yemen visited the ruins of two temples containing votive objects and inscriptions, at the foot and on top of Jabal al-Lawdh, which closes the N side of the Jawf depression of North Yemen. The sanctuary on the mountain lies 1000 m higher than the one at the foot. They are linked by a 6-km-long paved, processional way with a constant slope that clings to the side of the mountain or is carved into it. They include large courtyards containing numerous parallel stone benches from 10 to 16 m in length. Inscriptions mention the offering of ritual meals by several Sabaean rulers, so that those considerable installations probably were used for the ritual meals of the pilgrims. In one of the temples a remarkable engraving on a wall shows a procession of elderly musicians with (masks imitating?) bird heads.

During the ancient period of the kingdom of Saba persons were dedicated in thanksgiving to the tutelary god of a temple, probably in order to perform some temporary duties in his service. But in the kingdom of

Ḥimyar, the historical rock inscriptions of the 3d century A.D. at the sanctuary of the goddess Šams in al-Mi‹sāl mention the ritual slaughter of civilian and military prisoners as a sacrifice in gratitude for a military victory. A similar custom is mentioned in inscriptions of Ethiopian kings in the 4th century A.D. Such human sacrifices were apparently exceptional. The ancient dedications of persons for the service of the god evolved relatively early into dedications of bronze or silver statuettes representing the dedicator, or even the god to whom the dedication was offered. Other objects of dedications were incense burners, statuettes of animals (offered for the well being of cattle), but also figurines of male or female sexual organs, offered in view of obtaining children. Many such dedications were normally described in an inscription and offered on the injunction of the god expressed through his oracle as a condition to the granting of the requested favor. The oracle is generally designated by the word *mas›al,* "interrogation," or "place of interrogation," without any indication as to the procedure involved. That was probably the most commonly used oracular term in pre-Islamic Arabia. A more specific method of divination was *istiqsām* or rhabdomancy: the drawing of lots represented by arrows or rods, each of which was supposed to give a specific answer (positive, negative, etc.) to a question asked from the god, possibly by a priest. Another type of oracle was oniromancy, or divination based on dreams. This appears in inscriptions in which the god is said to have expressed his will through "visions," which he had "shown" to his servant "during his sleep," or "in the temple" (an allusion to incubation), and sometimes "for him," i.e., through the offices of a professional "seer." One such medium, a woman, is called a *ḥlmt,* "seeress of dreams."

Another important cultic rite is what has gone down to Islam under the name *istisqā›:*a "supplication for rain" in case of severe drought. A Sabaean inscription from the 3d century A.D. relates that after a long period of severe drought the whole population of Mārib went to the temple outside the city and presented supplications to the god, while the women magicians were performing their tricks. On the same day, rain fell on the mountains; the flood reached Mārib during the following night, and filled with water the whole irrigation system around the city.

The hunting *(ṣd)* of the gazelle, the game devoted to ‹Aṯtar, was a rite of the ancient rulers of Saba aimed at obtaining good rains or favorable omens. This cultic rite was also performed on other kinds of game in honor of other gods. In a Sabaean text the goddess Šams orders a tribe to go hunting in her honor two days every year, in order to obtain protection and prosperity. Hunting the ibex as a charm and—when successful—as a presage of forthcoming rain, is a rite still performed nowadays in certain parts of the Ḥadhramawt.

C. Magic and Funerary Customs

Magic was of course linked to religious practice. Various terms designate the "evil eye" and the "evil spells" which one asked the god to be protected from, or to exert against one's enemies. Amulets carried the name or symbol of a god. The magic formula Wadd›āb, "Wadd is father," or reliefs representing a bucranium and called *śḥr,* "talisman," were inserted into the façade of buildings. Astrology also played a role; people asked for children endowed with "a good astrological configuration," and late reliefs figure the signs of the zodiac.

Funerary customs testify to a belief in an afterlife. Collective tombs consisting of several chambers, sometimes underground, were dug out in the soft limestone. Inscriptions at the entrance of a collective sepulcher specify the title deeds and respective share of ownership of the various occupants and utter threats against any usurper. During their 1986–87 campaign, the Soviet-Yemeni Archaeological Expedition in South Yemen discovered a ritually slaughtered camel in the middle of such a collective underground sepulcher. Several surgically prepared mummies, buried without a coffin, were discovered in 1983 in funerary chambers dug out in a cliff at Shibam Sukhaym, northeast of Ṣan‹ā›. Next to the usual pottery in clay or stone and to artifacts such as weapons or jewels, the burials contain small incense burners or bull heads in alabaster. Various types of funerary inscriptions are found in the graves: stone plinths bearing the name of the deceased supporting a bust, a head or a stone statuette, or even a plain polished alabaster plaque (on which a portrait may have been painted). Stelae were found bearing a name and a human face or bust incised or carved in the round. More elaborate epitaphs called *nfs* of *nṣb* are stone slabs which may include, next to the name of the dead and a threat against any usurper, a single or

double relief illustrating the daily activity of the deceased (hunting, ploughing, riding a camel, etc.) and a scene of the other world, such as the presentation of an offering to a seated goddess.

D. The Monotheistic Religions

After A.D. 350 the dedications to pagan gods give way to monotheistic invocations to " (the) God," "the Lord of Heaven," "the Lord of Heaven and Earth", *Raḥmānān,* i.e., "the Merciful," etc. Since expressions of this kind were later used by Jews and Christians, the problem arises of the true nature and origin of that monotheism. Jewish colonies were founded in the Ḥijāz probably around the middle of the 1st millennium B.C., and Judaism must have penetrated into South Arabia during the first centuries A.D. As a result of a Byzantine embassy to the land of Ḥimyar in the middle of the 4th century; the chief of the Himyarites allegedly became a Christian in spite of the Jewish influence in his court and had Christian churches built in his country. That conversion is, however, far from being confirmed. Monotheistic formulas are used by members of the Himyarite dynasty from about 380 A.D., but while no outspoken Christian (e.g., trinitarian) expression appears before the beginning of the 6th century, specific Jewish ones (e.g. the use of the word *slwm,* corresponding to Heb *šālōm,* "peace," the mention of Israel, or the plural *ʾlhn,* "God," obviously a calque of Heb *ʾĕlōhîm*) already occur around the year 430 in inscriptions emanating from Abūkarib Asʿad, a king who according to the Arab tradition was converted to Judaism by rabbis from Yathrib (Madīna). Owing to the recognized presence of Jews (or Jewish converts) in South Arabia from about the middle of the 4th century, it seems unfounded to suppose that the first South Arabian monotheism belonged to Ḥanīfism, that alleged and elusive Abrahamic monotheism which the Arab tradition claims having existed in pre-Islamic Arabia.

Syriac and Arabic sources attribute to Syrian missionaries at the beginning of the 5th century the conversion to Christianity of Najrān, an oasis at the N frontier of Yemen. An Ethiopic account describes the martyrdom there of Azqīr, a Najranite Christian, at the hand of Jews, during the reign of Šhuraḥbiʾil Yakkuf, a king known from inscriptions after the middle of the 5th century.

Somewhere around the year 520 a Jewish convert, Yūsuf Asʾar (the sinister duµ-Nuwaµs of the Arab tradition), took hold of the throne, and later (523?) attacked the Christians, mainly foreigners, in the country; Ethiopians were burnt alive in the blaze of their church in the capital Ẓafār, and in the haven of Mokhā, while the king prepared the siege of Najrān by barring the northern access to the oasis to possible relief from Christian Syria or Central Arabia. Those events are described in three rock inscriptions set up in the desert by Jewish generals of Yūsuf. In October–November of the same year the king and one of his generals put to death hundreds of foreign and indigenous Monophysite Christians in Najrān, by having them burnt alive in their church, or beheaded by the sword. That persecution is described in various hagiographic accounts. Having been told of the events, the Ethiopian Negus Ellā Aṣbeḥah decided to build a fleet in order to invade Yemen and avenge his fellow Christians. This he achieved two years later (525?) by landing in Yemen with his troops, by killing the Jewish king, and by installing an indigenous Christian, named Sumyafaʿ, as his viceroy. Sumyafaʿ is the author of a long inscription written "In the name of the Merciful, of His Son, the Victorious Christ, and of the Holy Ghost."

A few years later a former Ethiopian general named Abrahah seized power and made himself independent from the Negus. His long inscription about repairs at the famous dam of Mārib is drawn up "By the might and the help and the mercy of the Merciful, of His Messiah and of the Holy Ghost." Near the end of his reign he made in Central Arabia an expedition, mentioned in a rock inscription which is drawn up "By the might of the Merciful and of His Messiah." That expedition may have some connection with the Arab tradition of an abortive expedition he launched against Mecca around the year 570, traditionally assigned to the birth of Muḥammad. A few years later the Persians invaded Yemen which later became a satrapy. No inscription is recorded since that occupation, which ended in 628 when the last satrap embraced Islam, followed by many Yemenis. In 631 the Jewish and Christian communities in Najrān formally accepted, in a convention with the Prophet Muḥammad, the political domination of Islam in exchange for the right to continue to practice their religion.

SOUTH ARABIC LANGUAGES. See LANGUAGES (PRE-ISLAMIC SOUTH ARABIA).

SPAIN (PLACE) [Gk *Spania* (Σπανια)]. The S European peninsula protruding into the Atlantic Ocean at the W end of the Mediterranean Sea, now comprised of Portugal and Spain (1 Macc 8:3; Rom 15:24, 28). From paintings, Spain's history has been traced back at least to Paleolithic times. The Phoenicians had established trading posts on the SW coast by the time of Israel's conquest of Canaan. By the time the N kingdom of Israel was overrun by Assyria, the Greeks, apparently lured by Spain's precious metals, controlled Spain's commerce. Not much later, Phoenician Carthage became regionally ascendant and pushed the Greeks back to the NE corner of Spain and dominated the coastal area. Financed by Spain's resources of gold, silver, tin, copper, lead, and iron, the Carthaginians rivaled Rome until the Second Punic War (218–201 B.C.). Rome subsequently defeated Carthage in the Spanish peninsula and undertook the subjugation of Spain in order to protect themselves from further Carthaginian provocation (1 Macc 8:3). This task took almost two centuries, but by the turn of the era the Romanization of Spain had built up a full head of steam (Schulten *CAH* 8:187–298; Sutherland 1939). Besides wealth, Spain made many substantial contributions to Rome. Five Caesars (Galba, Trajan, Hadrian, Maximus and Theodosius) came from this geographic region along with a host of literary greats including the two Senecas, Lucan, Martial, Pomponius, Mela, Columella, Quintilian, Prudentius, and Orosius (see Collins 1983; Rostovtzeff 1979).

Perhaps the significance of Spain's place in the Roman Empire gave Paul the inspiration to evangelize this W frontier (Rom 15:24, 28). Strategically placed churches in this important region would have been consistent with Paul's missionary strategy, but whether he actually traveled to Spain remains in doubt. Although Clement, writing approximately thirty years after Paul's death, records that the apostle reached "the boundary of the West" (*1 Clem.* 5:7), an expression that probably refers to Spain, and the *Acts of Peter* and the *Muratorian Fragment* concur explicitly, this evidence has not removed the uncertainty from the minds of most scholars. The tradition which asserts that James introduced Spain to the Gospel (PL, LXXXIII, 151) has not been taken seriously.

SPARTA (PLACE) [Gk *Spartē* (Σπαρτη)]. SPARTAN. The name of a city in S Greece also known as Lacedaemon. During the Dorian settlement, ca. 1000 B.C., the city-state Lacedaemon, later known as Sparta, was probably founded. Slowly, after protracted wars with Amyclae and Messenia, Sparta became a regional power. By the conclusion of the Peloponnesian War (404 B.C.), Sparta had become the most significant city-state in Greece (37°04´N; 22°25´E).

During the reign of the high priest, Onias I (320–290 B.C.), Sparta apparently courted the Jews resulting in a friendly relationship between the two parties. In fact, correspondence between these 2 parties discussed the possibility that both the Spartans and the Jews were descendants of Abraham (1 Macc 12:20–23). Though some doubt the authenticity of the Spartan correspondence, it is not impossible that the supposed Spartan letter in 1 Macc 12:20–23 is essentially authentic (Goldstein *I Maccabees* AB, 447–60). Apparently a colony of Jews had settled in Greece and had facilitated warm relations between Israel and Sparta because, in 168 B.C., Jason found asylum in this community after he failed in an attempted coup (2 Macc 5:9).

Later, ca. 146 B.C., Jonathan apparently also tried his hand at statesmanship with Sparta. Jonathan appealed to the city-state to renew their friendship; he based his appeal upon the above-mentioned letter

from Sparta to Onias I which supposedly had inaugurated a friendship between the two parties (1 Macc 12:1–23; cf. Josephus *Ant* 8.5.8; 12.4.10). Some scholars, however, have also doubted the authenticity of Jonathan's letter. Again the genuineness of Jonathan's letter is not impossible, especially if the letter from the Roman proconsul Lucius to the pharaoh of Egypt is authentic. This latter letter alludes to an effort by the Jews to renew a friendly relationship between the Jews and the Romans (cf. 1 Macc 15:16–21). If the Jews were taking the political initiative with the Romans, then it becomes probable that they also courted Sparta.

After Jonathan's death, Sparta seems to have corresponded again with the Jews, this time with Simon, the high priest. This correspondence apparently was an attempt to restore the past political friendship (1 Macc 14:16–23). The final mention of Sparta occurs in 1 Macc 15:16–22 (cf. Josephus, *Ant* 14.8.5). This text mentions a letter from the proconsul Lucius to the king of Egypt (139 B.C.) with copies sent to other nations as well. The letter requests the recipients not to engage the Jews in conflict. Most importantly, the letter singles out Sparta (1 Macc 15:23) and thereby encourages the enduring friendship of the two nations.

SPIRITS IN PRISON. The identity of "the spirits in prison," to whom 1 Peter 3:19 refers, is disputed. An exegetical issue which cannot be separated from this is the connection with v 18, where "made alive in the spirit" is now generally recognized to refer to Christ's resurrection. Some take "in which" *(en họ)* to refer loosely to the whole process of Christ's death and resurrection, and so are able to date his journey to preach to the spirits in prison between his death and resurrection, while others take it to refer to "spirit" in the sense of the spiritual realm and so are able to date his preaching to the spirits in the time of Noah, before his incarnation. But it is most plausibly taken to refer to Christ's risen condition ("alive in the spirit"), with the result that his journey to preach to the spirits must be dated after his resurrection. This means that the journey can probably be identified with that of v 22, i.e. his ascension to heaven.

There are three major views on the identity of "the spirits in prison" (for the history of interpretation, see Dalton 1965).

First, they are Noah's human contemporaries, who refused to heed his preaching while God's patience gave them opportunity to repent by delaying the Flood. Some form of this view was held by most exegetes until recently. According to one version of it, Christ's preaching to them occurred during his "descent to Hades" and is the same as the preaching of the Gospel to "the dead" to which 4:6 refers. A difficulty with this view is that, whereas references to the descent of Christ to Hades in the early extracanonical literature often refer to his preaching to the dead, it is always a question of the righteous dead of OT times, not notorious sinners such as those who died in the Flood. A second version of this view (Feinberg 1986; Grudem *1 Peter* TNTC) holds that the preexistent Christ preached *through Noah* to Noah's contemporaries while they were still alive. They rejected his message and are called "the spirits in prison" because that is what they are now, at the time of writing. This view can appeal to the Jewish tradition of Noah's preaching repentance to his contemporaries (to which 2 Pet 2:5 refers).

Second, the "spirits in prison" are angelic beings, which the word "spirits" alone (rather than "spirits of …") probably most naturally suggests (though human spirits is not at all an impossible meaning of the word). Specifically they are the fallen angels (the Watchers) as known especially in the Enoch traditions (and cf. Jude 6; 2 Pet 2:4; Dalton 1965). These ("the sons of God" of Gen 6:1–4, according to the

commonest early Jewish interpretation) disobeyed God by descending to earth, mating with women, and teaching humanity evil practices. Thus they were responsible for the corruption of humanity which led to the Flood. Although their descent from heaven occurred well before the time of Noah, the evil which they were still perpetrating reached its peak in the time of Noah. They were subsequently confined in a prison which *1 Enoch* locates beneath the earth, but which *2 Enoch* (7; cf. 18) locates in the second of the seven heavens. In this case, Christ could have confronted them during his triumphal ascent to heaven, and his preaching would be his proclamation to them of his victory over evil. Their submission to him would be included in that of the angelic powers to which v 22 refers.

Another recent view (Michaels *1 Peter* WBC 49, 203–11) is that the spirits are not the Watchers but the evil spirits derived from them. According to *1 Enoch,* the Watchers themselves are no longer active in this world, but the spirits of their children, the giants, became the evil spirits who continue to promote evil in the world until the last judgment. On this view, the spirits would be the evil spirits so often mentioned in the gospels, and Christ's proclamation of his victory in order to receive their submission would be more relevant to 1 Peter's readers than a reference to the Watchers. However, this view is obliged to take *phylake* in the sense of "refuge" rather than "prison":wherever they sought a safe haven Christ went to proclaim his victory to them. This is not the most natural interpretation. Moreover, there is a good reason why the Watchers, rather than the evil spirits active after them, should be mentioned. According to the Enoch traditions, they were the source and origin of all subsequent evil on earth. It was appropriate that Christ as victor over all evil should especially receive their submission.

STABLE, STABLES. A building or architectural sub-unit in which domestic animals, particularly equids, are housed and fed.

———

A. Stables in the OT.
1. Terminology.
2. Within the Ancient Near East.
3. Archaeology.
4. Historical Implications.

B. In the NT

———

A. Stables in the OT

1. Terminology. The term "stable" does not appear in the RSV, and only once in the AV (Ezek 25:5), where it mistranslates Heb *nawēh* (RSV "pasture"), with reference to camels. Instead, the Bible speaks of "stalls" (or "spans/teams"? [see below], Heb *ʾurôt*) "of horses for his [Solomon's] chariots" (1 Kgs 5:6 — Eng 4:26; cf. 1 Kgs 10:26; 2 Chr 9:25), and "for all kinds of cattle" (2 Chr 32:27–28; where the term is in apposition with "treasuries" [Heb *ʾōsārôt*], "storehouses" [Heb *miskĕnôt*], and "sheepfolds" [Heb *ʿadorîm*]). This last occurrence is probably a rhetorical flourish of the Chronicler, and need not be taken into serious consideration, except that it occurs in parallel with terms signifying built structures or buildings. The problem comes into focus when we consider that the Hebrew term *ʾurôt* (sing. **ʾurwâ*) is a loan-word from Akk *urû (m)*, "stall." In Middle Babylonian, however, the term may also mean "stallion," and in Neo-Assyrian, "span," or "team" (von Soden *AHW* 3, 1435, I, II). Thus, while "span" or "team"

would make a fitting translation for the earlier usage (1 Kgs 5:6 —Eng 4:26; 2 Chr 9:25), it would not suit 2 Chr 32:27–28. Whatever the translation, the earlier usage reflects the military-political viewpoint, since what is of immediate significance is the number of horses in active military service or training, which necessitated their stalling (see below), and not the number of buildings, or the total number of horses owned by the crown. Within the OT, stalls for young "feeder" cattle seem to be distinguished by the term *mărbēq,* "calf [/calves] from the stall", i.e., specially fattened calves: 1 Sam 28:24; Jer 46:21; Amos 6:4; Mal 3:20 —Eng 4:2. The term *ʾābûs* in the phrase *šôr ʾābûs* "stalled [= fatted] ox" (Prov 15:17) may elsewhere equal "crib" in its more ambivalent English usage as either "manger" or "stall," cf. Job 39:9 (wild ox); Isa 1:3 (ass). From these indications, as also from more general considerations, we should expect the archaeological attestation of "public" /royal stables, cities whose primary function might be to garrison chariot troops, and private stabling facilities within the economies of ancient Israel and Judah.

2. Within the Ancient Near East. Chariot teams in the ancient Near East were invariably stallions (Pope 1970:59–60), or upon occasion possibly geldings. Stabling provisions would be needed only for those horses which were in training. In all probability, the studs, brood mares, and foals were allowed to roam freely through the upland valleys, as in ancient Greece (Anderson 1961:4), cf. 1 Kgs 18:5 and 1 Sam 9:3. In the latter instance, the narrative concerns asses. It may be assumed, however, that, within a given culture-region, large-scale breeding practices for horses and asses would be similar.

The number given in 1 Kgs 4:26 for Solomon's horses (40,000) is either legendary, or, more likely, a copyist's error of one order of magnitude, a probability suggested both by one of the major manuscripts of the LXX, Codex Vaticanus, which reads "four thousand," and by 1 Chr 9:25 ("four thousand"). From this viewpoint, the translation "stall" clearly suits better than "span/team," which again yields overly large figures. Note further that the numbers of "horsemen" *(pārāšîm)* and "chariots" (*rekeb*, the term is also used with reference to chariot horses), 12,000 and 1,400 respectively, that Solomon is said to have stationed in the chariot cities (*ʿarê hārekeb*) and in Jerusalem (1 Kgs 10:26) are more consonant with the lower figure, especially when includes trainers, grooms, supply personnel, other stable hands, etc., in addition to the charioteers themselves. That this is an idealized, but nevertheless attainable figure, retroverted into the Solomonic period by later generations, is suggested by the fact that Ahab is credited with 2,000 chariots, i.e., at least 4,000—and probably 6,000—horses, in Shalmaneser III's account of the Battle of Qarqar (853 B.C.; Luckenbill, *LAR* 1, 223, para. 611). Some of these may have been Judean (1 Kgs 22:1–4). This figure has, however, also been questioned (Naʾaman 1976:97–102), but see below. Given what we presently know of the archaeology of early Israel, even if one accepted such a large number for the time of Ahab, it is quite unlikely that it could have held true for the historical Solomon.

The importance, and accompanying economic burden, of chariot forces both to Israel and Judah is abundantly witnessed in the OT (Deut 17:16; 1 Sam 8:11–12; 1 Kgs 4:26–28; 9:19; 16:9; 18:5; 22:4, 29–38; 2 Kgs 8:21; 10:2; Ps 20:7; Isa 2:7; Mic 6:10). Certain unnamed cities were expressly designated "chariot cities" (1 Kgs 9:19; 10:26, 2 Chr 1:14, 8:6, 9:25). Regardless of the historicity of their attribution to Solomon, it seems clear that the appellation was consonant with functional types of cities known to the later Judean historiographers. "Horses … and … chariots of the sun" (2 Kgs 23:11), almost certainly related to terra-cotta images found in some quantity in Iron Age Cyprus (e.g., Gjerstad et al. 1935:789, pls. 234–35 [Ajia Irini]; Karageorghis 1977:38, 67–73, pls. 8:12, 13; 25:1–4 [Meniko]), and which were among the cultic paraphernalia destroyed during Josiah's cleansing of the temple. There was a "horses' entrance" to the royal palace in Jerusalem (2 Kgs 11:16), and the slain kings Ahab and Josiah were borne home from the battlefront in chariots (1 Kgs 22:34–38; 2 Kgs 23:30).

3. Archaeology. The numbers of tripartite pillared buildings of standardized design, first identified as stables by the principal excavators at Megiddo, have multiplied during the past century's excavations in Palestine to the point that they are now, after domestic houses, the second-most-common architectural entity known from the period of the Hebrew monarchy. See Fig. STA.01; also MEG.05. Buildings of this general plan are known from Tell el-Hesi, Megiddo, Beth-shemesh, Lachish, Hazor, Beer-sheba, and Tell el-ʿUreima (Tel Kinrot). Furthermore, chariots are among the items rained down from the walls of Lachish upon the forces of Sennacherib in the siege-relief scenes of the 701 B.C. campaign against Judah,

and a Judean chariot is depicted in the procession of captives leaving the city (Ussishkin 1982:105, figs. 69, 82, 90).

Outside Israel and Judah proper, similar structures have been found at Tell Qasile, and Tell Abu Hawam (Mazar 1967:11, fig. 6; Hamilton 1935:pl. 4). The "Military and Police Stables" at Tell el-Amarna (Pendlebury 1951:131–35; pls. 21, 53:1–3) provide a large LB example of somewhat different architecture, while a small "private" stable was discovered at Ugarit, also in the LB II period (Schaeffer 1938:313–17; 1939:284; 1962:3, 18, fig. 13). From further afield, a building closely similar to those from Israel and Judah, but with double the intercolumnar spacing, has been excavated at the Urartian site of Bastam (Kleiss 1970:22–23; 1972:14–18; 1974:107–9, *Abb.* 3). Two late Nabatean structures interpreted as stables, incorporating many of the features of the above, have recently been found at Kurnub (Negev *EAEHL* 3:723–27; 1983:101–3; further, on Roman Period stables in the Hauran and Syria, see Negev 1988:104–7). It is of interest to note that the "perforations for tethering horses," appear erratically in this building as at Megiddo and probably at Beer-sheba strata III–II (Negev 1988:102–3, photos 79, 80).

Beginning with the excavations at Hazor in the late 1950s, and gaining fresh impetus with the subsequent discovery of substantial quantities of pottery and other domestic artifacts (loom weights, grinding stones, etc.) in units excavated at Beer-sheba, various scholars have raised questions regarding not only the interpretation of these particular buildings, but of the Megiddo buildings as well, rightly insisting that, given the common building plan, one interpretation should equally apply to all (Aharoni 1973:115; Pritchard 1970; Herzog 1973:26–27). These criticisms were answered in part by Yigael Yadin (1976), who concentrated on proving that stables involving such things as stone mangers were known in the ANE well before, and during the time of the Hebrew monarchies. J. Holladay (1986) addressed the question in greater length and approached the problem from the perspective of functional architectural design as applied to the care and keeping of highly conditioned, carefully trained horses of great economic and military significance.

In this work, Holladay evaluated the extant building materials and methods and the housing requirements of highly conditioned horses, and from these postulated what elements would go into the design of military horse barracks and how those considerations relate to the Palestinian structures in question. The result demonstrated that, from an architectural perspective, the tripartite pillared halls are an extended series of modules, measuring 1.45–1.80 m wide and 3.00–3.5 m deep (i.e., from the back wall to the inside front lip of the manger), which conform exactly to modern horse "standings," complete even to matters of lighting, ventilation, and ease of cleaning. Further obvious features include the mangers, hardened surfaces, and, in many cases, tethering devices, on either side of a central maintenance aisle. Given this degree of "fit" between the requirements of horse management and the design of these buildings, so widely distributed in time and space throughout the cities of the Sea Peoples, Israel, Judah, and Urartu, it seems clear this particular class of buildings was designed *and perpetuated* with only one function in mind: that of providing an efficient, workable setting for the care and maintenance of stalled horses, which, in the setting of ancient Israel, meant chariot horses.

The typical Israelite and Judean "public" or "royal" stable was thus a long hall, longitudinally divided into three aisles by a double row of pillars arising from low walls which ran the length of the structure, except for a transverse aisle at the front of the building. The latter provided access to the two side aisles from the main—most often the only—doorway, which was usually situated in the center of the front wall. In most cases the stables were located near a gateway, and in at least the case of the S stables at Megiddo, the stables fronted onto a large parade yard. See Fig. MEG.05. The hallmark columnation offered the potential for non-glare clerestory lighting and excellent no-draft ventilation for the entire length of the building, which regularly (Megiddo, Tell el-Hesi, Lachish, Beer-sheba), shared common party walls with other units of the same design. Other sites (Beth-shemesh, Hazor, Tell el-ʿUreima [Tel Kinrot], Tell Qasile, and Tell Abu Hawam) have individual units. As already noted, most units had a single main doorway, leading from the service aisle into a courtyard or street. In their first phase (Stratum III), the Beer-sheba units had one doorway for each aisle, which was replaced in their final phase (Stratum II) by a single central doorway for each unit. The Beth-shemesh stable, the small Tell Abu Hawam horse and

donkey stable and the Bastam building also had a small rear doorway suitable for use by the handlers. The Hazor stable, and probably the Beth-shemesh building as well, was distinguished by having a single doorway at the end of one side wall, opening directly out from the transverse aisle. Well-cut limestone *(nari)* mangers, roughly 1.2 × 0.60 m and 0.70 m high (ca. 0.90–1.05 m above floor levels, including the height of the underlying wall), with a recessed trough roughly 90 × 30 cm by ca. 12–15 cm deep, topped the low intercolumnar walls at Megiddo, their place being taken by stone and mud-mortar mangers at other sites. The horses faced inward (the preferred modern orientation) toward the center aisle, which was invariably of packed chalk/limestone or packed earth, while the two side aisles were invariably paved with cobblestones, in conformity with the triple requirements of durability, ease of cleaning, and preservation of the horses' hooves (Xen. *On Equitation,* 4.3–5). Some columns at Megiddo and Beer-sheba had holes bored through their corners just above manger level, possibly for use as tethering points. One unit at Beer-sheba had a pair of stalls converted into a loose-box, possibly for difficult, sick, or injured horses. No other partitioning devices have been noted, and it is probable that, in keeping with military stables down to modern times, "bails", i.e., poles or heavy planks suspended from the roofing timbers, were used to keep each horse on his ground. A few smaller units, probably serving only a few teams, have been found, e.g., the small Stable 401–359, in the N complex at Megiddo, and, possibly, Building 416 at Beer-sheba, each probably housing the select teams (5 or 6) of the commanding officers (so already Lamon and Shipton 1939:47).

Grain-storage facilities suited to the scale of the stables have been found at Megiddo, particularly for the S stables, where the great Storage Pit 1414 (attributed, probably incorrectly, to Stratum III) could accommodate almost exactly the yearly feeding requirements *in barley* of the 150 horses of the S stables at a rate of 10 lbs./day plus 10% waste: (150 × 11 × 365)/48 lbs. per bu. = 12,547 bushels, against the pit's estimated capacity of 12,800 bushels (Lamon and Shipton 1939:66). The capacity of the N Pits 414 and 415 was considerably less, and the supply must either have been augmented during the year or there must have been other storage facilities nearby. A pit very like the three Megiddo pits was near the Beth-shemesh stable, and a two-halled stone-floored storehouse, possibly for grain-storage, adjoined the Hazor stable. If uniformly filled to a depth of 1 m, it could have accommodated about 6,250 bushels, half the capacity of Megiddo Pit 1414, and about 4.15 times the annual barley requirements of 18 horses. Filled to a depth of 2 m, it could have fed 150 horses for a year. It is, however, possible that one hall could have been devoted to other staples, e.g., wheat, for human consumption.

The similarity of the stalling arrangements in the large tripartite pillared buildings to standard layouts on the ground floors of typical three- and four-roomed houses (Pritchard 1970:272), as well as in larger houses such as those near the citadel at Hazor, is, in a sense, unremarkable. The latter facilities, which are based on a smaller module (roughly 1.05 wide × 2.00 m deep, although this varied), unquestionably served as domestic stables, housing donkeys, mules, and cows and bulls/bullocks (the latter being a smaller breed or breeds than those commonly seen in present-day Europe and N America). Arc-shaped floor-level mangers made of small boulders overlaid with straw-and-mud mortar, often termed "bins," probably served for cattle. An interesting example of nondomestic stalls with bench-style mangers based on this smaller module is the facility in Hazor Locus 3103, which occupies a clearly "public" location immediately by the stairs leading to the main floor of the Citadel (Yadin et al. 1960:pl. 204). At ca. 1.05–1.10 m wide and 2.00–2.25 m deep, including the depth of the manger, these are obviously too small for horse standings (see above) and probably served as the Citadel's stable for riding-donkeys and mules, the normal mode of personal transportation.

4. Historical Implications. a. During the 10th and 9th Centuries B.C. The geographical and temporal distribution of the large military stables within Israel and Judah is a matter of some interest, in that it allows at least a partial glimpse at the otherwise obscure military establishments in the twin states. For the Solomonic period, G. Davies has demonstrated a poorly published stable unit predating the N stables at Megiddo (Davies 1988). To date, this is the only unit from that horizon.

From the period of Omri and Ahab come the roughly 450 stalls in the N and S stable complexes at Megiddo and the 19-stalled single unit at Hazor (the odd place may have been occupied by a night

watchman's post [Yadin et al. 1960:6], or, as in some modern stables, by the horses' "pet," e.g., perhaps a goat—or by both entities). Probably contemporaneous with these better-attested facilities are the 4 early units beside the palace-fort gate at Lachish (Starkey's "Government Storehouse," which may once have had an E analog; Ussishkin 1983:147–54) and the 4 larger units of the "Northern Building" in the same palace compound, which would include Loci 1050, 1051, and 1052. At between 19 and 20 m internal length, and using the low figure of 1.45 m for the width of individual stalls, the "Government Storehouse" complex could have accommodated about 44–48 horses (4 × 11–12 stalls). If there had been an E counterpart, it would have added another 44–48 horses. The "Northern Building," some 29 m deep, could have accommodated about 72 horses (4 × 18 stalls). Thus, assuming a team of two horses per chariot, the forces available to a combined Israelite-Judean contingent (this possibility is at least allowed by 1 Kgs 22:4; so also Yadin 1963:300) at the time of the Battle of Qarqar from *known* units at Hazor, Megiddo, and Lachish alone would have amounted to about 294 chariots. These could have contributed about 14.7 percent of the 2,000 chariots of Ahab, or nearly 50 percent in excess of a total of 200 (assuming an order of magnitude mistake in the text of the "Monolith Inscription from Kurkh" of Shalmaneser III; cf Na›aman 1976:97–102). For the lower figure, the stables at Megiddo alone would suffice. Assuming, as a maximal figure for normal troop complements, three horses per chariot, the third animal being an outrigger or trace horse (Littauer 1976:218–19, 223–24; Yadin 1963:298, 386–87; Littauer and Crouwel 1979:113–16), the respective figures would be (a) 9.8% of 2,000 chariots, or (b) 98% of 200 chariots. Assuming an E counterpart to the "Government Storehouse" at Lachish, we would have 10.5% of 2,000 chariots and 106% of 200 chariots.

Obviously the number of horses in a team makes a great difference in the reconstruction. Unfortunately, for Israel and Judah during this period, it is not possible to be certain of this figure. We are almost totally dependent upon the Assyrian reliefs (Nagel 1966; Madhloom 1970), with important details from a variety of other sources, mostly Cypriot and other models, and actual exemplars (Littauer 1976, Littauer and Crouwel 1979). Lamon and Shipton (1939:44) consider three horses a likely figure, and Na›aman ([1976:99] who cites Nagel's [1966:53–60] analysis) contends that four horses were typical for Assyrian chariots from the time of Assurnasirpal II (883–859 B.C.) forward (note that these are mostly royal).

There is however, one reason (below) to suspect that the number of horses hitched to a *typical* (i.e., nonroyal, nonstandard-bearing) Israelite battle chariot of the 10th–9th centuries B.C. was greater than the classical ANE two-horse team (note, however, Yadin's observation [1963:88–89] that the standard ratio of horses to chariots in LB booty counts was 3:1). Large, heavy Assyrian royal chariots were only just making the transition to three- and four-horse teams (i.e., two horses under yoke, with one to two outriggers) in the time of Assurnasirpal II. On the other hand, to judge from the rather meager evidence, N Syrian chariots of the 9th and 8th centuries, with which the Israelite chariots would most closely have been allied, were "small and light … generally occupied by two men, the warrior and the charioteer" (Madhloom 1970:27). A logical inference is that these N Syrian chariots were probably drawn by a team of two horses. By the end of the 8th century, however, at least the (state?) chariot of the governor of Lachish was drawn by four horses. (Cf. the depiction of the captured Judean chariot in the "Lachish Reliefs," where the four-horse yoke is prominently figured in the victory procession; see Ussishkin 1982:77, 84–85, 88–91, 116). After the Assyrian occupation of the N kingdom for a third of a century, the borrowing of such a status symbol/technological innovation by rulers of the S kingdom is hardly surprising. Even so, this one attestation does not reveal much about the standard configuration of the typical Judean battle chariot of the late 8th or 7th centuries B.C., let alone that of the mid-9th century.

One final consideration, however, may indicate the number of horses required to support the Israelite-Judean contingent at the Battle of Qarqar (853 B.C.). From the logistical perspective, it seems reasonable to argue that foreign campaigns would have necessitated each charioteer taking along a spare horse to replace a yoke horse lamed or otherwise incapacitated while on campaign. To be effective under battle conditions, this spare horse must have been trained with the primary team, perhaps the use of outriggers, which are not all that helpful with respect to traction (Littauer and Crouwel 1979:128, but cf. also p. 29),

developed from, and was a natural concommitant of the practice of campaigning in foreign lands (Littauer and Crouwel 1979:128; cf. Yadin 1963:88–89, 298).

To return to the historical analysis: The single stable unit at Beth-shemesh is overlaid by "later walls," i.e., possibly of the same period as those associated further to the NW with the late Iron II casemate wall system, so it probably should also be assigned to this early period. If the Tell el-Hesi stables were to be dated to this period, together Beth-shemesh and Tell el-Hesi would add about 40 more two-horse teams to the available pool, bringing it up to 16.7% of a 2,000-chariot contingent, or 11.1% based on a 3-horse team (using the larger figure for Lachish, 17.9% or 11.9% respectively). Insisting upon the exclusively Israelite composition of these forces does not alter the equation very much. Megiddo and Hazor alone could have contributed up to 234 two-horse teams: 11.7% of a force of 2,000 (or 7.8% of a 2,000-chariot force comprised of three-horse teams).

The significance of these figures for understanding the potential chariot forces available to Ahab is simple. With far less than 16.7%, or 11.7%, or even 7.8% exposure of the potentially relevant 9th century stratigraphy of the twin states of Israel and Judah (or the single state of Israel), we have already accounted for those respective percentages of the chariot forces attributed to Ahab in the Monolith Inscription. If a scribal error is posited, even reckoning on three-horse teams and disallowing the larger figure for Lachish, we have already located all but one of the necessary stables. It is inconceivable, however, that we have already located almost all of the stables of the early 9th century with so little exposure. Nor is it certain that all stables were located on tell sites. This would distinctly reduce the likelihood of discovery of such units. The statistics currently available allow, and, in fact, favor the larger number, which is, in any case, not an exact figure.

The numbers of troops and chariots listed in the Monolith Inscription are large, and major losses in battle (implied by Shalmaneser III's "in that battle I took from them their chariots, their cavalry, their horses, broken to the yoke" [*LAR* 1, 126:223]) would keenly have been felt, but the numbers are not beyond reason, and it can be demonstrated that the economic drain upon the country/countries would not have been intolerable in the short term (contra Na›aman 1976:100–2; note that in 1986–87 "tiny" Israel had more tanks [3,660] than the German Democratic Republic, Egypt, or France, and it also had more armored fighting vehicles and tanks combined than Iraq [9,960 vs. 8,600]; International Institute for Strategic Studies 1987). On the other hand, public perceptions about the acceptability of maintaining such a powerful force may have altered radically in the face of widespread crop failures and famine (1 Kings 17–18). That Israel probably suffered a major loss of chariotry at about this time, followed by a declining interest in such forces (or inability to finance following the breakdown of relations with Tyre), is suggested by the degeneration of later building phases of the N stable units at Megiddo and by the crown's failure to rebuild the ruined stable at Hazor (see below).

b. 8th (and 7th?) Centuries B.C. Following the high point of the Megiddo stables under the Omride dynasty, some of the units (Stable 364 at least, but probably others as well) in the N complex were rebuilt, with stone and mud mangers replacing the monolithic stone mangers of the time of the Omride dynasty (Lamon and Shipton 1939:63–64). Presumably, these inferior stables were those in use during the last years of Megiddo's service as an Israelite city (the years immediately prior to 733 B.C.), possibly suggesting a modest rebuilding of forces following an earlier nearly complete decline (e.g. 2 Kgs 13:7). While it is clear that there were not as many units in these rebuildings, because of the confusion of the excavations of Megiddo Stratum IVA, it is not possible to say very much about what actually was there. At the relatively small site of Tell el-‹Ureima (Tel Kinrot), Fritz dates the destruction of a "pillared building" to the conquest of the N kingdom by Tiglath-pileser III in 734/33 B.C. (1986:61). At about 15 m long, it could have accommodated some 18–20 horses.

This general picture of decline in Israelite chariot forces during the later parts of the 9th century and, probably, most of the 8th century is supported by the failure to rebuild the unit at Hazor following the destruction, apparently by earthquake, of Stratum VII, ca. 760 B.C. (Yadin et al. 1960:14–16, 19). However, the building had been once rebuilt during the general period ca. 885–760 B.C. (Yadin et al.

1960:6–7, 9, 14, pls. 200–1), presumably indicating that the decline following the Battle of Qarqar was not total.

In the S, stables were still prominent through the period of Lachish Level III (see below). We have already noted the depiction of a Judean chariot in the "Lachish Reliefs." The later 4 units of "Building 1034" and its E wing (Ussishkin 1983:147–51) may belong to this later phase of the city's history. Whether or not the "Northern Building" was still serviceable is a moot point. Little can be said regarding the date of the three units at Tell el-Hesi, which could just as easily have functioned in this period as in the former. Finally, the three Beer-sheba stables were newly built in Stratum III (we have no knowledge of their predecessors, if any), and were destroyed at the end of Stratum II (= Lachish Level III), in a wave of destruction generally attributed to the campaign of Sennacherib in 701 B.C. (Ussishkin 1977:52), although arguments can be mounted in favor of a later date, nearer to or at 597 B.C. (e.g., Holladay 1976:259–70). During this brief period, Beer-sheba may be taken as a model example of a "chariot city":a government chariot-garrison expressly posted to police and patrol either Judah's S border, or, more plausibly, the important Beer-sheba–Zered trade corridor.

c. 7th (?) and Early 6th Centuries B.C. For the period following the generalized destructions characterized by pottery of the Lachish Level III horizon, and terminating with the destruction of Lachish Level II (587 B.C., by general consent), we have, at the present, no evidence for the existence of stables, although it must be admitted that the basis for our knowledge is severely limited.

B. In the NT

Uniquely in the Lukan birth narratives, the infant Jesus is said to have "been laid in a manger *('en phatnē),* because there was no place for them in the inn" (Luke 2:7, cf. 2:12, 16). Alternatively, in this account, *phatnē* may mean "stable", or even an open-air feeding place for animals (*BAGD*). Traditionally, the cave underlying the Church of the Nativity has been understood to be the stable concerned. The use of cave stables, both natural and artificially made, is still widespread in traditional Arab villages, and elsewhere in the Middle East, and a largish cave converted into a horse stable complete with about 100 hewn rock mangers, presumably by the Tobiad Hyrcanus, has been discovered at Araq el-Amir, in the Transjordan W of Amman (Conder 1889:65–87). Notwithstanding, virtually every house, not to mention inn, in Bethlehem must have had stalling provisions, i.e., a domestic stable, for the owner's asses and cattle, and each of these would have been equipped with either—or probably both—the floor-level stone and mud "bin" -type manger, or the mud and rock (exceptionally, cut stone) bench-type mangers better witnessed in earlier Israelite and Judean archaeological contexts (see above). The ubiquity of these features across the social landscape is central to the thrust of the saying of Jesus in Luke 13:15: "You hypocrites! Does not each of you on the sabbath untie his ox or his ass from the manger and lead it away to water it?"

JOHN S. HOLLADAY, JR.

STACHYS (PERSON) [Gk *Stachys* (Σταχυς)]. A Roman Christian who received greetings from Paul in Rom 16:9 as "my beloved." Having been close to Paul in the E of the Roman empire, he had immigrated to Rome. This latter fact is confirmed by the inscriptions of the city of Rome; that only thirteen epigraphical matches of "Stachys" exist shows that the Romans seldom used the name (Lampe *StadtrChr*, 139). Stachys was probably a gentile Christian. See NEREUS. It has been proposed that Stachys was a (freed) slave, but the inscriptions do not reveal a significant occurrence of the name for slaves (see Lampe *StadtrChr*, 150, 152–53); only three out of eleven possible 1st-century "Stachys" inscriptions refer to slaves of freedmen. For further discussion see the commentary on Romans in EKKNT.

PETER LAMPE

STADIA [Gk *stadion* (σταδιον)]. See WEIGHTS AND MEASURES.

STAG. See ZOOLOGY.

STAIRS OF THE CITY OF DAVID (PLACE) [Heb *ma‘ălôt ‘ir dāwîd* (מַעֲלוֹת עִיר דָּוִיד)].

A staircase about 75 meters SE of the present-day "Pool of Siloam" that descended a rocky scarp from the City of David to the Fountain Gate. Nehemiah notes that Shallum son of Col-hozeh from Mizpah repaired the Fountain Gate and a section of the wall by "the stairs that go down from the City of David" (3:15), and that the dedicatory procession came to the Fountain Gate and ascended the "stairs of the City of David" (12:37).

R. Weill's second campaign of excavations (1923–24) in the City of David uncovered this staircase (about 1.5 meters wide) that descended a rock scarp from a platform area within a well-fortified area dating from before the Iron Age (Weill 1947:15, planche, VII). The upper access to the stairs was found at

the S tip of Weill's massive wall A and at the N face of the great square defensive tower D (Weill, 1947:15, planche II). It descends nearly 11 meters to the Fountain Gate, and runs a distance of about 13.5 meters to the SE from the defensive tower at the top of the stairs. Weill found that the staircase was abruptly cut off near the bottom by intersecting canals (II and IV, Weill, 1947:60–73) from the Pool of Siloam, with Canal IV exiting the Fountain Gate under the Staircase. The staircase survived until its materials and route were used to construct a drainage system for the City of David (Weill's shallow catch basin "O", trench "S–S" and small oval basin "B") during the Second Temple period (Weill, 1947:15). Contrary to a general consensus (Simons, 1952:127–28), Weill proposes that this staircase exiting the citadel is the "way of the gate between the two walls" through which Zedekiah and all the men of war escaped Nebuchadnezzar's siege (2 Kgs 25:4; Jer 39:4; 52:7; Weill 1947:95–96).

DALE C. LIID

STAMPS, ROYAL JAR HANDLE. Handles of Judean storage jars on which were impressed a seal containing a symbol plus the word *lmlk*, "to the king," or "belonging to the king," and usually the name of one of four cities, Hebron, Socoh, Ziph, and *mmšt.* The last of these is not mentioned in the Bible, and the pronunciation is unknown. See MMŠT.

First discovered in Jerusalem by C. Warren in 1869, examples of the stamps now number well over a thousand. Considering the relatively small amount of excavation that has occurred thus far in the territory of biblical Judah, the total number of these stamps originally produced must have been enormous.

The stamps occur in two major types with a number of variations. The first type, the "four-winged" stamp, depicts a flying scarab beetle. See Fig. STA.02 (a). The word *lmlk* stands above the symbol and the city name below. The second type, the "two-winged" stamp, has the same arrangement except that the flying scarab is replaced by what is generally interpreted as a winged sun disc. See Fig. STA.02 (b). Some examples have only *lmlk* with no place name, some have a place name without *lmlk,* and some have only a symbol with no writing at all. Despite the possible variations, the total number of master seals was apparently quite small, perhaps no more than twenty-two (Lemaire 1981).

With few exceptions, the stamped handles come from a single type of storage jar. (Two examples belong to a larger pithos of very different type and manufacture.) Often referred to as the Type 484 jar after the number assigned to it in the British excavations of Lachish, it stands 60 cm high (about two feet) and has four vertical handles spaced symmetrically around the shoulder. The handles have one or two ribs running vertically; and the stamps are placed at the upper end, sometimes with care, sometimes with obvious haste. The jars average slightly more than 45 liters in capacity (about 10.5 U.S. gallons) or about two biblical baths.

A totally persuasive explanation for the use of these jars has yet to be found, but ongoing research is providing valuable new data. Analysis of the chemical composition of the 484 jars has demonstrated that all of them were made in one place somewhere in the Shephelah, probably near Lachish (Mommsen et al. 1984). This gives support to the hypothesis that they originated in a royal pottery (1 Chr 4:23). Also enough complete jars have now been recovered to show that there is a considerable variation in capacity, thus ruling out the long-standing theory that the jars represented a royal standardization of measures (Ussishkin 1983:162–63). Also new is the demonstration that the stamps of private individuals commonly occur on handles of jars which also bear a royal stamp (Ussishkin 1976). These private stamps seem to be found, however, only with the two-winged stamps. Finally, the renewed Lachish excavations have established that the four-winged and two-winged stamps were contemporary, pointing to a briefer period of use for the stamps than many had supposed (Ussishkin 1977).

The exact dating of the stamps has long been a vexed problem. However, the issue has been resolved to the satisfaction of most scholars by the new excavations at Lachish since 1973. See LACHISH. The archaeological and literary evidence point to the campaign of Sennacherib in 701 B.C. for the destruction of Level III, the stratum where the *lmlk* stamps largely occur, meaning that their *floruit* was the reign of

Hezekiah at the end of the 8th century B.C., although it may have begun slightly earlier and continued for a time into the 7th century.

There are perhaps two factors in the royal stamps which have presented the most difficulty for interpreters, namely, the meaning of the four city names and the evidence of both pattern and randomness in the geographical distribution of the stamps.

One influential theory, most highly developed by Aharoni (*LBHG,* 394–400), proposes the four cities to be administrative centers for the four districts of Judah, charged with collection and storage of taxes in kind. But the four cities, Hebron, Socoh, Ziph, and the unknown *mmšt,* form a puzzling group. Hebron and Ziph are only a few miles apart. And why would one chief city be the enigmatic *mmšt*? Linguistic arguments that would interpret *mmšt* as the Hebrew word *memšelet* or "government" and hence a metaphorical expression for Jerusalem have persuaded only a few. See MMŠT. Furthermore, one would expect to find handles bearing the names of the cities heavily concentrated in four distinct regions of Judah, but this is not the case: Hebron stamps form the largest group at Lachish and *mmšt* is common in the N but all four names are found in all parts of the country.

Another theory would construe the four names as royal vineyards (most recently Rainey 1982). This would explain why an obscure *mmšt* would be on the list and why the names are found all over the country. But no stamps bearing the city name Socoh have been found among the many picked up at Socoh itself, nor have *lmlk* stamps been found at Hebron or the most probable site of Ziph. Moreover, some royal stamps have no city name at all which would seem to indicate that the stamps have a broader purpose than simply indicating the geographical origin of a product.

Despite the interpretive difficulties posed by the royal-stamp jars, there does seem to be some movement toward elements of a consensus (Aharoni *LBHG;* Rainey 1982; Mommsen et al. 1984; Naʿaman 1986):in the reign of Hezekiah, the Judean government undertook to move massive quantities of liquid goods—oil, wine, or both—and, by implication, grain to the N and W regions of the country. (The stamps have been found largely in the N [Gibeon, Tell en-Naṣbeh, Jerusalem, Ramat Raḥel] and in the Shephelah from Gezer S to Lachish. Finds in the hill country S of Ramat Raḥel and in the Negeb have been negligible.) This provisioning system was organized out of some fourfold pattern represented by the city names that we cannot yet fully understand. The preponderance of the jars on the borders hints at preparations for the Assyrian attack of 701 B.C., and the observable geographic distribution of the stamps represents moments in that system frozen in time by the progressive Assyrian campaign.

STATISTICAL RESEARCH ON THE BIBLE. The first proposal of a statistical method for biblical research was made in 1851 when Augustus de Morgan suggested the use of mean word-length for the comparison of Hebrews with those Epistles which open with "Paul …" (Lord 1958:282). Just under a century later, actual statistical studies of biblical authorship began, stimulated by the work of Udny Yule on the authorship of *De Imitatione Christi* (Yule 1939). The three main foci of interest have been the Pentateuch, Isaiah, and the Pauline Epistles. Based on statistical analysis, it has been asserted that the first twenty-three chapters of Genesis do conform to the Documentary Hypothesis (Chenique 1967; Houk 1983), and it likewise has been asserted that they (and indeed the entire book) do not (Radday and Shore 1985). It has been asserted that Isaiah is not from one hand (Radday 1973), and that it is (Adams and

Rencher 1973). It has been asserted that Philippians, Colossians, and 1–2 Thessalonians are from one hand (Wake 1948), and that they are from three hands (Morton 1978). To quote Tallentire (1971:117):

> The conclusions reached about style, via computational methodologies, far from being "definitive" by virtue of their objectivity, are mutually contradictory.

Some unreliable conclusions have stemmed from faulty data, many from faulty statistical method, but most from faulty interpretation. Often, both of a pair of contradictory results are incorrect in that neither is a valid inference derived from the data. That, thus far, the end results of most research in this area have been seriously flawed indicates not that statistical methods have little to contribute to biblical studies, but rather that much greater care must be exercised in their application and interpretation.

E. Concluding Remarks

———

A. Preliminaries

1. The State of Affairs. The status of statistical methods in biblical research is well described by M. Halle (1958:28), substituting *biblical scholar* for *linguist:*

> Some of us regard anything in mathematical garb as if it were a revelation from on high, while others reject it out of hand as an endeavor to bully the [biblical scholar] into accepting conclusions he is not in a position to verify. Crude attempts at applying unsuitable mathematical techniques to irrelevant problems, therefore, not only waste the time of those who carry out the research, but also increase the resistance among [biblical scholars] to developments that represent genuine progress.

Responsibility for this state of affairs lies with the often-reverential users of statistics, whose enthusiastic expositions frequently substitute assertion for carefully crafted explanation, and with their critics, who frequently register technical quibbles rather than engage the fundamental issues. Add occasional barrages of ad hominem argument, and it is little wonder that the nonplussed noncombatant leaves the field.

2. Arguments Against the Use of Statistics. There are those for whom the enterprise *feels* inappropriate, those who "look askance at any method of literary study which tries to find the truth of conscious literary composition in numerical statistics from which the spirit of the computer has flown" (Knox 1963:116). To these one can only offer reassurances that they can understand and critique properly

explained methods, and that statistical methods are but one way among many of gaining insight into our texts.

There are those who argue that language is rule-governed so that statistical methods are not applicable. Such arguments were common during the rise of generative grammar when the new method was clearing the way for its ascendancy (Chomsky 1957:18). While it has been proved that "language cannot be exactly a Markov process"—a process wherein the probability of encountering a particular item is determined solely by the items which have preceded it (Good 1969:374)—one can get a very long way indeed modeling language as a Markov process. Perhaps an analogy will be helpful: while it is true that Newtonian physics must be supplanted by Einsteinian physics in order fully to account for observed phenomena, in most situations Newtonian physics provides a totally adequate approximate representation.

Finally, there are those who hold that the usual methods of inferential statistics are inappropriate for studying language because the requirements for their applicability are not met. Instead, descriptive methods should be used (Weil 1974:29). (*Inferential statistics* makes inferences as to the characteristics of entire [actual or hypothetical] populations based on samples drawn therefrom. It is contrasted with *descriptive statistics,* which compresses the description of data and/or transforms the data in ways that allow the analyst to hypothesize previously hidden relationships.) This attitude is certainly understandable, given the excessive inferential zeal manifest in much of the literature. But it also is an instance of "the all too common error of over-reaction" (Mallows and Tukey 1982:114). There is a need both for exploratory descriptive analyses and for carefully formulated inferential procedures.

3. Assessing the Literature. Repeatedly in this essay, the literature applying statistical methods in biblical research will be assessed by answering the following five questions:

1. *Are the data sound?* Usually, one must accept on faith that the primary data are accurate. Occasionally, internal checks and/or comparisons of gross counts with those obtained from other data sets allow one partially to assess data integrity.

2. *Are the data sufficient to the task?* This is a fundamental issue in statistical studies: the problem of sample size. If the data set is too small, the confidence one can have in inferences based on it or hypotheses suggested by it will be too limited.

3. *Has the method been proven in the current context of use?* The assumptions which underlie the method should be explicit, and evidence should be provided that the data conform sufficiently to the assumptions so as to make use of the method defensible.

4. *Has the method been used with adequate safeguards?* Proper research includes safeguards taken to ensure that the (computer) manipulations used to extract results are carried out reliably.

5. *Are the conclusions warranted?* Given results obtained via appropriate, validated methods applied to a sufficient sampling of accurate data, the researcher must not leap to unwarranted conclusions as to causative mechanisms and as to the confidence one may place in results.

4. The Analysis of Style. Before surveying the literature, we shall present the main ideas of a sensitizing paper by Doležel (1969). Its precepts supply an antidote against the many faulty assertions and inferences we shall encounter.

A writer X_i of language L in some practical context Q_j produce a set of texts T (X_i,Q_j). Here X_1 might be Isaiah, X_2 might be Jeremiah, X_3 might be Ezekiel, etc.; Q_1, Q_2, etc., might refer to various life situations encountered by the prophets. The range of possibilities across all speakers in all possible contexts for language L is summarized by Table 1, adapted from Doležel's paper.

When we sum texts across the top row (over all conceivable contexts), we obtain T (X^1), the set of all texts producible by Writer X^1. When we sum texts down the first column (over all possible writers), we obtain T (Q^1), the set of all texts producible in context Q^1. When we sum across all combinations of writer and context, we obtain T (L), the set of all texts in language L.

Doležel distinguishes three sorts of writers: if composition is independent of context, we have a *context-free* writer, a poet. If composition is fixed by context, if individuality has no effect on composition, we have a *context-bound* writer, a bureaucrat. If both individuality and context affect production, we have a *context-sensitive* writer, a "common writer." Sociopathology aside, the subjective and objective factors

differentially affect everyone's writing at one time or another. That is, we are all sometimes context-free, sometimes context-bound, and sometimes context-sensitive writers.

The set of all texts in a language, T (L), can be classified in terms of the subjective factors (X_i and the objective factors (Q_j) conditioning their characteristics. Some characteristics will be homogeneous across all texts. These Doležel refers to as *supra-stylistic.* His example of such a characteristic is the distribution of graphemes in texts. Other characteristics, termed *sub-stylistic,* vary unpredictably across the texts of a language. (Doležel speculates that the variations are the result of pragmatic factors not taken into account by his theory.) *Sub-stylistic* characteristics are the bane of any statistical theory of style as they are confounding variables, variables which can lead the unwary to infer effects where none exist.

When one removes the supra-stylistic and sub-stylistic characteristics from consideration, one is left with a set of characteristics (Doležel symbolizes them by C_k) whose dependence on subjective factors (X_i) and objective factors (Q_j) it should be possible to map. Some of the C_k will depend only on subjective factors, others will depend only on objective factors, while still others will depend on both. Unfortunately, "alternations of factors controlling the same characteristic are possible." For example, sentence length may in some texts be controlled only by subjective factors (be author-specifying). In others, it may be controlled only by objective factors (be context-determined). And in yet others, it may be controlled by both. In the second case, sentence length will be utterly misleading for studying authorship; in the third case, it will only be of use given careful controls over context.

Table 1.
Texts and Their Conditioning Factors

	Contexts			
Writers	Q_1	Q_2	$\cdots$	Q_m	
X_1	$T(X_1, Q_1)$	$T(X_1, Q_2)$	$\cdots$	$T(X_1, Q_m)$	$T(X_1)$
X_2	$T(X_2, Q_1)$	$T(X_2, Q_2)$	$\cdots$	$T(X_2, Q_m)$	$T(X_2)$
.	.	.	. . .	.	.
.	.	.	. . .	.	.
.	.	.	. . .	.	.
X_n	$T(X_n, Q_1)$	$T(X_n, Q_2)$	$\cdots$	$T(X_n, Q_m)$	$T(X_n)$
	$T(Q_1)$	$T(Q_2)$	$\cdots$	$T(Q_m)$	$T(L)$

B. Early Authorship Studies

1. De Morgan on Hebrews (1851). In 1851, the eminent logician and mathematician A. de Morgan wrote to his clergyman friend W. Heald proposing the use of mean word-length for the comparison of Hebrews with each of the Epistles whose opening word is "Paul …" He averred (Lord 1958:282):

> I should expect to find that one man writing on two different subjects agrees more nearly with himself [as regards mean word-length] than two different men writing on the same subject. Some of these days spurious writings will be detected by this test. Mind, I told you so.

We have no record that either de Morgan or Heald ever carried out such research.

2. Mendenhall on Shakespeare (1901). Taking his cue from de Morgan, but using the distribution of word lengths rather than the mean word length, the American physicist T. C. Mendenhall studied the works of Shakespeare along with those of other Elizabethans. He found that the word-length distributions for Shakespeare and Bacon were considerably different, while those for Shakespeare and Marlow were very similar, producing "something akin to a sensation … among those engaged in the work" (Mendenhall 1901).

3. Yule on *De Imitatione Christi*(1939). G. U. Yule introduced sentence-length statistics as author-specific indices. These were used to select Thomas à Kempis rather than Jean de Gerson as the author of *De Imitatione Christi.* Note that Yule had writings shown to be by each candidate author and asked whether the behavior found in *De Imitatione Christi* was closer to one or the other, a particularly

straightforward situation. In *The Statistical Study of Literary Vocabulary* (Yule 1944), Yule introduced his "characteristic K," a measure of vocabulary diversity. This work was the triggering event for the use of statistical methods in biblical research.

C. Studies in the NT

We first take up NT statistical studies, since these got underway almost twenty years before statistical work on the Hebrew Bible. We shall lavish attention on the earliest work because its limitations reappear repeatedly in the literature.

1. Wake on the Authorship of the Pauline Epistles (1948). Leaving aside research involving simple counts, W. Wake was first to apply statistical methods to a biblical problem. His paper sets an unfortunate precedent: because the texts are short and the range of sentence lengths limited, the discrimination problem "can be solved only by means of certain modern statistical techniques, the results of which are given here but not the working nor the detailed argument establishing the validity of use" (1948:51). These omissions turn the evaluation of Wake's work into a frustrating exercise.

Using the *Textus Receptus* of 1863 from which lists have been removed and treating the Greek colon as a full stop, Wake tabulates the sentence-length distributions for the Pauline corpus. That is, he tallies how many sentences are between one and five words in length, between six and ten words in length, and so on for each epistle. (The five-word intervals are chosen so each contains sufficient counts to make statistical analysis reliable.) He excludes Philemon and Titus on the grounds that they are too short for analysis. For critical reasons, 2 Corinthians is divided into 2 Corinthians 1–9 and 2 Corinthians 10–13. By dividing the various epistles into sections, Wake characterizes the sentence-length distributions (by examining how critical points of a distribution, such as the median, vary across the sections) and clusters the twelve texts into two major groups plus four stragglers: (1) 1 Corinthians, 2 Corinthians 10–13, Galatians, Romans; (2) 1–2 Thessalonians, Philippians, Colossians; (3) Ephesians; (4) Hebrews; (5) 1–2 Timothy; (6) 2 Corinthians 1–9. He concludes that the two major groups each had its own author.

Are the data sound? Wake provides far too little information to allow a meaningful assessment. He states that for Ephesians the mean sentence length is 18.2 words and the ninth decile (length below which 90 percent of the sentences lie) is 36.7 words. Morton (1978:173) reports values of 30.31 and 58.75, respectively. These differences may be due to the use of different NT editions and/or to different ways of specifying words and sentences. (Indeed, Morton [1978:167] mildly criticizes Wake for using an outdated NT edition. In a later paper, Wake discusses sentence-length definition [1957:334].)

Are the data sufficient to the task? Wake only gives the reassurance that the sections are "each sufficiently long." His later paper (1957) gives more detail on text sectioning but makes no reference to what methods were used in his earlier work.

Has the method been proven in the current context of use? Since Wake gives few details, we can but surmise. From his few clues, we infer that his methods assume the distributions are Gaussian, that is, shaped like the standard bell-shaped normal grading curve. In fact, they are not. The data appear to be such that their logarithms follow the bell-shaped Gaussian distribution (Morton 1978:176). In his later work (1957:331), Wake appropriately transforms nonbiblical sentence-length data so that they are more nearly Gaussian.

Has the method been used with adequate safeguards? In addition to comparing the scatters of distributions to allow clustering of texts, Wake also carries out an "analysis of variance" (ANOVA), yielding similar results. We shall not explain ANOVA. While it is robust to departures of data from the assumed Gaussian distribution, it involves other assumptions with regard to which the data should be assessed (Sachs 1984:494).

Are the conclusions warranted? According to Wake (1948:54):"The most obvious explanation for the existence of two separate and distinct groups is that they are the work of different authors." That an explanation is "obvious" does not make it true. Yule, in his study of *De Imitatione Christi*, used sentence-length distributions to compare his questioned text with texts known to be from the two candidate authors he considered. Wake's problem is more difficult. He has several texts and wishes to decide how many authors they must have had. Yule's situation involved supervised learning, while Wake's situation is the

much more difficult case of unsupervised learning. For Wake to succeed, he must show that for his chosen criteria the differences among certain texts are greater than the differences within the texts. If he succeeds convincingly, he must then show that the inter-text differences are accounted for by purely subjective factors, that objective factors, such as audience or genre or author's age, have no effect.

Wake may have shown that some inter-text differences in sentence-length distributions significantly exceed intra-text differences, making the identification of clusters of texts reasonable. Unfortunately, he has provided insufficient information to allow us to judge. But he does not show that the differences he detects are due solely to differences in author. Consider three findings not available to Wake; (1) C. B. Williams (1970:60–63) showed that sentence lengths for the "descriptive" prose and the "dialogue" of Lord Dunsany differed greatly. (2) He also showed that rhyming greatly affected the sentence lengths of Masefield. (3) K. R. Buch (1969) showed that one author's sentence-length distributions for works written twenty years apart differed greatly. None of these results involved Koine Greek, so they do *not* disprove that sentence length is author-specifying for the Pauline corpus. But they do illustrate that it is not "obvious" that differences in sentence-length distributions indicate changes in author. In his later paper (1957:345), Wake concludes:

> The markedly skew distributions of sentence lengths of passages of continuous prose seem to display a constancy which enables them to be used as objective criteria of authorship style. The distributions only vary from sample to sample in a manner expected for samples drawn randomly from a fixed population of sentence lengths. This seems to be true for all Greek as well as English authors and the exception that Plato's works provide can be accounted for by the literary form adopted. In any case they are characteristic even though their variability is greater than would be obtained by random sampling of a single population for there seems to be trend with age superposed.

In condensed form: Sentence-length distributions are author-specifying, except when they are not. When they are not, reasons can be found (literary form, age trend).

2. Grayston and Herdan on the Authorship of the Pastorals (1959). Grayston and Herdan sympathetically expound and critique Harrison's "vocabulary connectivity" analysis of the Pastorals (Harrison 1921) in preparation for carrying out a more rigorous analysis. They introduce "the alternative probability that a word is either peculiar to the part or common to all parts" of the corpus under study. If $V_{peculiar\,i}$ is the number of word types (vocabulary items) peculiar to part i of a corpus, V_{common} is the number of word types common to all the parts of the corpus, and V_i is the number of word types in part i, then this probability is: $C_i = \frac{(V_{peculiar_i} + V_{common})}{V_i}$ For the Pauline Corpus, the values of C_i range from.30 to.35 for the non-Pastorals, while $C_{Pastorals}$ =.46, due to the very large number of unique vocabulary items. They conclude (10):"The magnitude of C for the Pastorals [that is, of $C_{Pastorals}$] supports strongly the hypothesis of non-Pauline authorship."

They also plot the logarithm of the vocabulary size *(logV)* versus the logarithm of the text length *(logN)* for each Epistle. The Pauline Epistles, excluding the Pastorals, lie close to a straight line, while each Pastoral Epistle lies a fair distance above the line. "This confirms in a formal way the suspicion as to the Pauline authorship for these Epistles" (14). Weitzman (1971) demonstrates that the observed behavior is likely merely a result of variations in text length.

With commendable reserve, Grayston and Herdan finally state (15):

> Altogether, it may be said that the linguistic evidence is strong enough to justify the conclusion of a very different style in the Pastorals. Whether this implies a difference in authorship depends upon one's conception of what style means. Statistics can do no more than establish such differences.

(Readers wishing additional details on these methods should consult Herdan's later work [1960:245–52; 1966:219–49], where both the Pauline Epistles and the entire NT are studied. Note also Weitzman's brief treatment of the NT epistles in his search for text characteristics which are independent of text length [1986b: 872].)

As to the soundness of the data, the study obtains its counts from Morgenthaler's reliable volume (1958), and hence it may be trusted.

As to the correctness of sample preparation, samples of the texts are nowhere involved, exhaustive counts being used. Were each epistle, however, viewed as a sample drawn from an unseen population of writings by its author, it would be possible to attach confidence intervals to the various results. That is, Grayston and Herdan could have indicated what confidence the reader could have in the various results as reflective of what would be found had we access to more extensive texts.

As to the correctness of their methods in this context, little background information is supplied. Viewed as two descriptive approaches, it is difficult to fault their method. When inferences are drawn as to what constitute significant differences, the work ceases to involve statistics and lapses into impressionism.

As to the adequacy of safeguards, the paper includes full details of the arithmetic, allowing the reader to check the work.

Are the conclusions warranted? The haste in jumping to conclusions as regards multiple authorship in the body of the paper is offset by the evenhandedness of the final words. Most would agree that they have shown that the Pastorals differ from the Pauline Epistles as regards vocabulary diversity. That this behavior is due to differing authors rather than literary form, subject matter, etc., has not been shown.

3. Morton on the Authorship of the Pauline Epistles (1963). Starting with his quarrelsome article in *The London Observer* of November 3, 1963 ("A Computer Challenges the Church") and culminating in chap. 14 of his book *Literary Detection* (1978:165–83), A. Q. Morton and his collaborators have written repeatedly on the problem of the authorship of the Pauline corpus. The following exposition is based on the 1978 book, with references to earlier work as necessary. We include most of our comments as we proceed. (The critique of Morton's presentation before the Royal Statistical Society remains relevant [Morton 1965:224–33].)

According to Morton (38):"The fundamental principle of stylometry can be set down thus: the authorship of texts is determined by looking at habits which are common to all writers of the class under examination. The habits are used by each writer at his own rate. The different writers are separated by calculating the differences between their rates."

Morton points out that observed distributions can be characterized in terms of the usual mean, median, percentiles, etc., or an attempt can be made to fit them to theoretical distributions. The reader interested in theoretical distributions would be well advised to learn about them elsewhere than in chap. 5 of *Literary Detection.* There, one finds confusing pedagogical misadventures: symbols that stand for counts on one page and probabilities on the next (p and q on 54 and 55), expressions called equations (55), negative probability (60), the assertion (68) that "the chi squared distribution is: $x^2 = \frac{\sum(0-E)^2}{E}$" with both the assertion and definition incorrect. The definition should read: $x^2 = \frac{\sum_i (O_i - E_i)^2}{E_i}$ (Here, the O_i are observed counts and the E_i are counts estimated using some model. We shall use this definition below.) The assertion should be that "X^2 obeys the chi squared (χ^2) distribution." One also encounters a profusion of typographical errors and careless notations, all told more than twenty in the chapter. All these miscues debilitate an important chapter in Morton's otherwise clear book.

Morton gives the characteristics of any writing habit used for author identification (96):

> First, it must be a habit apparent in a choice which frequently confronts all authors; second, it must be a habit which can be numerically expressed; and third, it must be a habit which can be shown to be unaffected by changes in subject matter, by the passing of periods of time, by reasonable differences in literary form and all other possible influences which might affect the habit.

Thus (98), "any habit which is bound up with nouns, tied as they are to subject matter, is unlikely to make a good indicator of authorship." And (101):"An uninflected language—English, for example—makes

sentence length distributions much less useful … the mean length is greater but the variance even more so." The former observation makes Morton wary of vocabulary-richness criteria. The latter, his distinction between inflected and uninflected languages, is often ignored by critics of his methods.

In their classic work, Mosteller and Wallace relied heavily on function-word frequency (1984:39). Uncritical use of function words for determining authorship was attacked by Herdan (1966:172–74) and seriously questioned by Damerau (1975). Morton sees difficulties with relying on common function words. He writes (102, 104):

> … it would appear that … common words would make good indicators of authorship if it could be shown that an author used them at a constant rate and individual authors differed in their rates of use. The difficulty of using them as a test of authorship is that their occurrence is too readily influenced by the literary form of the work being studied … For problems [with] a plenitude of samples and a limited choice of authors, the rate of occurrence of frequent words offers ample material for decision. But if these two factors are lacking, there is much less scope.

Morton thereby backs off from criteria central to his early work (1963; 1965). He now asserts the best author-discriminators are the absolute positions of words in sentences (for inflected languages) and the positions in terms of nearby words (for uninflected languages).

In Greek, sentence-length distributions "are an effective indicator of authorship" (108). For the Greek speech writer Isocrates, Morton finds differences in sentence-length distributions which he concludes are due to differences in literary form rather than due to the passage of time. He then notes that there are some tests (129):

> … which are completely unaffected by the variety of literary form, some which are affected by a change in literary form and others which are affected by the passage of years. As long as care is taken in making comparisons of texts which are in contrasting literary forms, tests of authorship are reliable.

One author hardly typifies all writers of Greek. As Morton elsewhere admits (102), "literary form cannot be clearly defined in detail." (Note that Brainerd [1979 and 1980] has produced convincing studies of Shakespeare wherein one set of text characteristics separates his works into genre clusters while another orders them chronologically.)

Chapter 14 of *Literary Detection,* "The Authorship of the Pauline Epistles," presents arguments based on sentence-length distributions plus limited results for positional studies. Where useful, we draw supporting materials from the fuller exposition of Morton and McLeman (1966). Morton sees the evaluation of the Pauline corpus as having two phases: first, establish the authorship of the individual epistles and, second, determine the internal integrity of the individual epistles. The first phase is executed via sentence-length analysis plus other tests independent of sentence length, the second via positional analysis. Following detailed discussions of sample-size determination and appropriate data transformations, Morton (180) discloses his conclusions based on sentence-length distributions:

> Romans, I and II Corinthians and Galatians form one group and the others are separate from it. In the linear scale [i.e., for the untransformed data] there is an anomaly in the third quartile of II Corinthians [the sentence length below which three-quarters of the sentences lie] and this may be due to chance. The table has five statistics for five epistles and one 5% difference is likely to appear in it, for it might turn out to be some indicator of the emendation of this text.

This passage is misleading in two respects, one factual and one interpretive.

Factual: The table referred to holds statistics for ten, not five, epistles. Thus, if his tests chance erring in five percent of the cases, he may obtain as many as two "significant" differences that are spurious.

Interpretive: Since Morton provides scant explanation as to how he reaches his conclusions, we must reconstruct his procedures. The basic ideas are hinted at in his early work (Morton 1965:217; Morton and McLeman 1966:53).

For each epistle and parameter (mean, median, etc.) he adds and subtracts twice that parameter's standard error (S.E.) so as to form its 95% confidence interval. That is, he determines the range of values within which the true parameter lies (with one chance in twenty, on average, of erring) based on the estimates of the parameter computed from the data. He then determines for which epistles which statistics

show significant differences from the behavior of Galatians, his Pauline gold standard. He announces in the notes to his table which epistles have confidence intervals which do not overlap with those of Galatians. (Underlying all this is his assumption that his parameters are Gaussian.) He finds these epistles are significantly different from Galatians; 2 Corinthians (for one parameter), Ephesians (for 5), Colossians (for 2), 1 Thessalonians (for 4), and Hebrews (for 5). He next examines how Galatians and the rest compare as regards the means of the distributions based on the logarithmically transformed data, finding that Ephesians, Philippians, Colossians, 1 Thessalonians, and Hebrews differ significantly from Galatians. From these results emerge his conclusions quoted above.

There are at least three problems with his method and his interpretation of its results: (1) Morton asserts that Romans, 1–2 Corinthians, and Galatians form a group and the others are separate from it. In fact his analysis shows (to his satisfaction, see below) that 2 Corinthians, Ephesians, Philippians, Colossians, 1–2 Thessalonians, and Hebrews are not from the same population as Galatians. In terms of inferential statistics, this does not imply that the others are from the same population; it merely shows that the tests do not allow one to decide if the others are or are not from populations differing from Galatians. They may be. If his assertion is based on some hidden practice of descriptive statistics, then he should explain why although 1 Timothy and 2 Timothy fail no tests, they are not included with the "genuine" Paulines. (2) 2 Corinthians fails one test but is restored to the Pauline fold on the grounds that one miscue in twenty-five tests may be expected. Why restore 2 Corinthians? Philippians fails only one test, so why not restore it? Or, since there are fifty tests for the statistics describing the raw data, why not restore both? If a priori information is to be excluded, it must be consistently excluded. (3) The criticisms of sentence-length distributions as author-specifying in C.1 above apply equally here.

As an independent (conservative) probe, we carry out a contingency table analysis of the sentence-length distributions. We have elsewhere explained such analysis (Andersen and Forbes 1986a: 15–25). Here we give only a brief explanation. Table 2 shows Morton's sentence-length data (1978:172–73).

Table 2.
Sentence Lengths in the Epistles

	Sentence Lengths (in Words)								
Epistle	1–5	6–10	11–15	16–20	21–25	26–30	31–35	>35	Totals
Romans	78	160	101	52	51	14	12	30	498
1 Cor	99	190	126	73	32	15	7	13	555
2 Cor	40	70	44	43	31	19	9	17	273
Gal	21	54	46	24	7	5	2	7	166
Eph	3	5	24	10	8	4	4	22	80
Phil	9	20	19	13	3	5	5	15	89
Col	5	14	10	7	6	8	2	10	62
1 Thess	4	15	7	11	7	4	6	12	66
2 Thess	3	7	9	5	0	3	1	7	35
1 Tim	14	22	19	20	10	4	5	4	98
2 Tim	14	13	22	10	5	4	5	4	77
Titus	5	5	7	3	3	2	0	4	29
Phlm	0	7	3	2	0	1	1	3	17
Hebrews	13	47	73	39	29	22	12	27	262
Totals	308	629	510	312	192	110	71	175	2307

We follow Morton in taking Galatians as the Pauline fixed point. We test each epistle to determine if it originated from the same population as did Galatians. We form a 2 × 8 contingency table for each pairing

of an epistle with Galatians. For example, for the test as to whether Romans and Galatians are likely from the same population, we get Table 3.

Table 3.
Observed Sentence-Lenth Distributions for Romans and Galatians

OBSERVED	Sentence Lengths (in Words)								
Epistle	1–5	6–10	11–15	16–20	21–25	26–30	31–35	>35	Totals
Romans	78	160	101	52	51	14	12	30	498
Galatians	21	54	46	24	7	5	2	7	166
Totals	99	214	147	76	58	19	14	37	664

If Romans and Galatians are samples from the same population, then we expect any cell entry in the table will be adequately estimated by multiplying its row total by its column total and dividing by the grand total for the table. This amounts to insuring that each epistle will receive its observed total of sentences, as will each range of sentence lengths [1–5 words, 6–10 words, etc.]. (For these estimates to be reliable, we must insure that each cell-count estimate exceeds unity by at least a bit [Sachs 1984:464]. This is the case for all the epistles save Titus and Philemon; rather than resort to procedures for sparsely occupied tables, we put Titus and Philemon aside.) By carrying out the arithmetic for each cell in the table of observed sentence-length counts, a second table can be built up, a table of estimated counts based on an assumed common underlying population. Table 4 shows the estimates for Romans and Galatians, as the reader may verify.

Table 4.
Estimated Sentence-Length Distributions for Romans and Galatians

ESTIMATED	Sentence Lengths (in Words)								
Epistle	1–5	6–10	11–15	16–20	21–25	26–30	31–35	>35	Totals
Roman	74.25	160.5	110.25	57	43.5	14.25	10.5	27.75	498
Galatian	24.75	53.5	36.75	19	14.5	4.75	3.5	9.25	166
Totals	99	214	147	76	58	19	14	37	664

In general, the OBSERVED and ESTIMATED tables will differ, either because the hypothesis that they originate from a common population is faulty or because of random sampling fluctuations. To decide if the former explanation accounts for the differences, one computes the X^2 statistic defined earlier, selects a significance threshold (we follow Morton in using 5%), and (taking into account a subtlety known as "degrees of freedom") looks up a threshold value in statistics tables (symbolized by $\chi^2_{.05}$). If X^2 exceeds this threshold, we reject the hypothesis that the pair of epistles is from the same population; if X^2 is below the threshold, we *may not reject* the hypothesis of a shared origin. For our comparisons, statistical tables inform us that $\chi^2_{.05} = 18.5$. The X^2 values resulting from our pairwise tests, arranged from smallest to largest X^2, are shown in Table 5.

Table 5.
Sentence-Length Test Results for the Epistles

Epistle	X^2
1 Corinthians	5.91333
2 Timothy	12.33053
Romans	12.39933
1 Timothy	12.51209
2 Thessalonians	16.52812
$\chi^2_{.05}$	18.5

Philippians	19.20194
2 Corinthians	20.49888
Colossians	24.87708
1 Thessalonians	33.71813
Hebrews	35.3673
Ephesians	51.73470

With one chance in twenty of erring, we may assert that an epistle which when compared with Galatians yields an X^2 less than 18.5 may come from the same population as Galatians. With one chance in twenty of erring, we may assert that an epistle which when compared with Galatians yields an X^2 greater than 18.5 is not from the same population as Galatians. Thus, our analysis tells us that, as far as sentence-length distributions are concerned, Philippians, 2 Corinthians, Colossians, 1 Thessalonians, Hebrews, and Ephesians do not come from the same population as Galatians. (Note well that the magnitude of X^2 does *not* indicate the extent of dissimilarity from Galatians. The length of an epistle influences the size of X^2.)

Morton tells us that "the odds which sentence length distributions left as odds for Pauline authorship [are] around a hundred to one against" (182). Would that we could see how the odds were obtained. As recovering odds from significance tests and compounding the results of multiple comparisons are both areas where statistical errors are *very* frequently made, the mere assertion leaves us unsatisfied.

The odds are moved from a hundred to one against Pauline authorship to "over a million to one against" (182) by evidence contributed by four vocabulary items in sentence positions one and two: *kai* (in sentence position one), *de* (in position two), *gar* (in position two), and *ei* (in position one). These four positional tests are, if Morton's assertions are taken at face value, a hundred times more powerful than sentence length in determining authorship, yet he devotes only one page to their exposure (180). Once again, methods receive minimal exposition. For this analysis, Morton considers two sets of epistles: Romans, 1–2 Corinthians, and Galatians make up Group I; the remainder (less Titus, 2 Timothy, and Philemon) make up Group II. Note that Morton is using the outcome of his previous analysis to group the epistles for this analysis. The resulting odds, therefore, are *not* independent of the former odds. But there is a more serious lapse, one common in authorship studies. Morton appears to perform a sequence of contingency table analyses and then compound their P-values. That is, he reckons the probability that the entire sequence of results could happen by chance. So far so good, assuming all this was done properly. He then appears to convert the compound P-value into odds. This step can only be taken in very special circumstances, the existence of which must be shown, not assumed (Meier and Zabell 1980; M. W. A. Smith 1983). From a purely statistical perspective, odds of a million to one have not been demonstrated.

(Morton [1986] has recently claimed that the positioning in sentences of once occurring words is writer specific; M. W. A. Smith [1987] has raised fundamental questions regarding Morton's claim. In addition to work on the Pauline corpus, Morton and his collaborators have written several books on the Gospels [MacGregor and Morton 1961; Morton and MacGregor 1965; Morton and McLeman 1980]. We refer interested readers to these and some associated reviews [McCasland 1961; Cadbury 1965; Fortna 1983].)

As to the soundness of Morton's data, we have little to go on. His set of criteria has evolved, so even checks via internal consistency are rarely feasible. For example, Morton uses counts of *de* as second or third word in sentences in one study (Morton 1965:222) and as second word only in another (Morton 1978:181), making comparison impossible. The sentence-length data in his Royal Society paper (1965:218) differ quite significantly from those in his book (1978:172). For example, in the former, Romans has 584 sentences; in the latter, it has 498. And so on, through the entire Pauline Corpus. To trace one profile of sentence lengths from 1965 to 1978:Philemon loses one sentence each from the 1–5, 6–10, 11–15, and 26–30 word categories, loses three sentences from the 16–20 word category, and gains one sentence in the 36–40 and one in the 56–60 word category. Much more drastic changes occur for other epistles. Morton supplies no explanation for these differences.

As to the sufficiency of the data samples for his tests, his requirement that "no expectation should be less than five" (1978:69), is by modern standards, conservative (Sachs 1984:475; Andersen and Forbes 1986a: 206). He gives repeated evidence of appropriate sensitivity to the issue of sample size.

The propriety of the statistical methods used and the validity of the conclusions reached have been commented on in the course of our exposition. One further point merits emphasis: the important effect that choice of significance level can have. In his early work, Morton chose to use a significance level of one percent (1965:217) so that *each* test had a 1 percent chance of yielding a faulty result. In his later work on the Pauline Epistles, Morton chose to use a significance level of 5 percent (1978:180), yielding the results given above. Had he retained the 1 percent level, his tests would have pointed to neither 2 Corinthians nor Philippians as being anomalous. Therefore, by *his* logic, Morton would have had to grant Philippians entry into his list of true Pauline Epistles.

4. Kenny on Stylometry (1986). Anthony Kenny has written a quite accessible, low-key volume. Its first four chapters carefully introduce the basic ideas of stylometry. Chaps. 5 through 11 are descriptive, taking up common words, conjunctions and particles, prepositions, the article, nouns and pronouns, adjectives and adverbs, and the verb. The focus is exclusively on intertext comparisons. Intratext comparisons are not made, an unfortunate omission. Chaps. 12 through 14 briefly consider the Lucan, the Johannine, and the Pauline problems. Chap. 15 critiques several of the methods used by Morton and colleagues and finds them wanting. The final chapter addresses "Constraints and Prospects."

Kenny's data appear sound and sufficient to the tasks attempted. The modest methods are appropriate to the limited goals sought. In the main, the conclusions drawn are warranted. Weitzman (1987) rightly judges Kenny's volume a "timely corrective to the exaggerated claims of some earlier stylometric studies in the New Testament." For those seeking an introduction to stylometry, Kenny's book is an excellent place to begin.

5. Neumann on the Pauline Epistles (1990). Kenneth Neumann provides an introduction to "The Problem of Authenticity" followed by a clear survey of the text-describing variables used by his predecessors in statistical analyses of authorship. While exhaustive in its cataloguing of the variables used, the survey lacks the sustained critical component necessary to aid would-be researchers in their own selection of variables. (In Neumann's defense, it should be noted that central to his method of analysis is a mechanism which selects from his huge list of possible discriminators the putative best few.)

Following a detailed statement of his research plan, Neumann reports his results and comments on their significance. Using teaching text samples from seven authors (Paul, the writer of Hebrews, Clement, Ignatius, Epictetus, Josephus, and Philo), his method decimates an initial 617 candidate variables to six. While these six variables perfectly classify the teaching texts used to select them in the first place, they misassign a third of a new wave of (testing) texts. Neumann attributes this unacceptable behavior to genre differences between the Christian and non-Christian authors. And so, the method is supplied teaching texts from only the four Christian authors and winnows the variables afresh. After a bit of disconcerting fiddling, all of the teaching and testing samples are properly assigned. When the disputed Pauline Epistles (Ephesians, Colossians, and 2 Thessalonians) are classified, all are assigned to Paul but not with much confidence. "These results, despite the Pauline classification, may still indicate a non-Pauline authorship" (Neumann 1990:195). There are signs that the method is not robust. For example: (1) text from Galatians is assigned to Ignatius with a probability of.99; this awkward behavior is suppressed by deleting—on nonstatistical grounds—two sections from the misbehaving Galatians text sample (1990:196); (2) Revelation 2–3 is assigned to Paul; this embarassing result is explained away unconvincingly (1990:220).

Neumann's approach is promising. However, his results vary greatly as variables are selected and deselected and as text samples are altered. This sensitivity suggests that his present conclusions are too brittle to be convincing.

D. Studies in the Hebrew Bible

Research on the Hebrew Bible using statistical techniques is too far-flung to cover exhaustively here. Some of our bibliographic entries receive no discussion. We shall concentrate on exposition of studies on style/authorship and on spelling.

1. The Isaiah Problem. a. Radday (1970). For our critique of Radday's work on Isaiah, we focus on his book (1973) rather than on his earlier article (1970). After tracing the history of the Isaiah problem and countering some criticisms of approaching the problem via statistical linguistics, Radday describes the preparation of the text of Isaiah for analysis. The consonants of the Letteris text of 1852 are used, homographs having been carefully resolved by attaching to each word a grammatical code indicating whether it is: (1) a noun, (2) a finite verb, (3) other type of verb, (4) residue. Sentence boundaries are marked. As Radday points out, carrying out this program requires considerable subtlety as to the definition of "word," "part of speech," "sentence."

The data having been prepared, Radday examines sentence-length distributions (1973:65–92). He cautions (1973:66):

> But it must be stressed that before Yule's test [on sentence-length distributions] is taken as an infallible means of ascribing an anonymous text to a certain author, sentence length will first have to be examined in the works of a very great number of writers, each in various periods of the author's life and in different topics and genres of his literary output. Not before the variance "within" a writer is sufficiently known, will sentence length become a criterion credible enough for comparison between two writers.

Radday immediately ignores his own advice, his reason being that many others have "put their trust in Yule's test."

To study behavior of parts of a text by a single author, Radday constructs two samples by bisecting a set of 360 sentences scattered across Ezekiel (about 20 percent of the book by word or verse count). He computes the descriptors of the sentence-length distribution for each sample (mean, median, first quartile, third quartile, ninth decile). *By eyeball,* he decides that each pair is sufficiently close save the third quartiles. But this "was only to be expected because of the prosaic character of the second half of the book where Ezekiel deals in necessarily longer sentences with matters of cult and architecture" (1973:77). The agreement of the statistics for the two (sampled) halves of Ezekiel "thus proves for the first time that qualitative individual language properties find their quantitative expression also for Biblical Hebrew authors." This is disconcerting. (1) Supposing there is a genuine discrepancy, it will not do simply to explain it away. (2) Even supposing that Ezekiel has satisfactorily been shown to be homogeneous as regards sentence length, the result is for two samples from one book, not for "Biblical Hebrew authors."

Radday next divides Isaiah into chunks and computes the sentence-length distribution descriptors for each. More eyeballing: "Sentence length alone warrants the assumption of two Isaiahs" (1973:83).

Radday is aware that tests, rather than impressions, are needed. Unfortunately, few details of the tests he uses are given, and the results are reported in a confusing way. Since his tests involve unproved assumptions about the sentence-length distribution, we analyze the data using contingency table analysis. Because the two parts of Isaiah (chaps. 1–35 and 40–66) each involve nearly a thousand sentences, our analysis involves an additional step beyond what was done in C.3. When contingency tables involve large counts, fairly slight departures of the observed data from model-generated data get magnified, leading to quite large values of X^2. (Recall that when X^2 is below a critical threshold, departures of observed data from estimated data based on a model are attributed to statistical fluctuations; when X^2 exceeds the threshold, the model is rejected on the grounds that it inadequately accounts for the observations.) To avoid being misled, we use a measure of association, Cramér's v, defined *in our case* by $v = \left[\frac{X^2}{N}\right]^{\frac{1}{2}}$, where N is the number of pieces of data in our table (Andersen and Forbes 1986a: 23, 240). This quantity varies between zero and one. A value of zero indicates the row and column variables of the contingency table are independent; changes in one have no effect on the other. A value of one indicates the two variables are completely associated, they co-vary in lockstep. Intermediate values imply intermediate degrees of association. For the two parts of Isaiah, we obtain v_{Isaiah} =.29; for the two samples of Ezekiel, we find $v_{Ezekiel}$ =.33. These results indicate that the degree of association between the portions of Isaiah and sentence length (.29) is actually less than that between the samples of Ezekiel and sentence length

(.33). Thus, Radday's reasons for assuming two Isaiahs lead equally, or even a little more strongly, to the assumption of two Ezekiels, contra Radday's assertion that Ezekiel is homogeneous.

Radday next takes up word length, as gauged both by syllable and phoneme count. Concluding a survey of previous work, he comments (1973:99):

> Summing up, it may be said, with all due caution, that word length is not a characteristic specific enough for deciding problems of contested authorship as long as it stands alone. Together with other parameters, however, and within the limitations of statistical linguistics in general, the test seems sufficiently reliable to be attempted.

Radday bases his analysis on: (1) pairs of 250-word samples drawn from five "irrefutably homogeneous Biblical books:" Hosea, Ezekiel, Job, Esther, and Deuteronomy (500 words per control book) and (2) trios of 250-word samples for each of his six sections of Isaiah. (Many scholars find these control books to be nonhomogeneous.) For the control books, the word-length distributions show "a remarkable consistency," except for Job. "But even there, the incongruity between the two samples is still less than within Tolstoy." Evidence from *War and Peace* having set his mind at rest, Radday proceeds to examine the behavior of Isaiah. "One must admit that [the] data are, for our purpose, poor." Various other measures incorporating word-length information for syllable and phoneme counts are introduced in turn. Our explanation of all of these measures would consume an unjustifiable amount of space. Therefore, we shall take up only one particular favorite of Radday, *redundancy,* which he persistently mislabels *relative entropy.* (*Redundancy* is one minus *relative entropy.*) A proper exposition of the concept of redundancy is beyond the scope of this essay. For present purposes, redundancy may be viewed as a measure of the relative "wastage" of symbols in a given text. If many symbols could be deleted without losing the message of a text, that text has a large value of redundancy. If the suppression of even a single symbol would affect the meaning of a text, that text has zero redundancy. Estimating the redundancy of a text is fraught with subtleties (Johnson 1979:221–23). We shall focus on only one of these. Radday's redundancy estimates for Isaiah are given in Table 6.

Table 6.
Redundancies of Sections of Isaiah

Section	Chapters	Redundancy
I	1–12	.30
II	13–23	.30
III	24–35	.36
IV	40–48	.24
V	49–57	.35
VI	58–66	.31

For Radday, the table "proves the unity of Sections I and II, shows Section III as an unrelated part of the 'First' Isaiah, and Section IV as isolated among the rest of the book" (1973:127). But the weight of these conclusions is even lighter than their impressionistic origins suggest. We are informed that there are *five* six-syllable words in Isaiah (Radday 1973:94). The redundancy estimates are based on three 250-word samples from each portion of Isaiah, *and they depend critically on the luck of sampling six-syllable words.* (This is because the estimator of redundancy Radday uses involves the logarithm of the maximum number of syllables observed in any word in a sample.) As it happens, Radday's samples miss the single six-syllable word in Section I and the one in Section II but include the single ones in Sections III, V, and VI. (Section IV has no six-syllable word.) Now suppose the luck of the draw had snared the two six-syllable words in Sections I and II instead of the two in Sections III and VI, a change in the sampling of four words in samples totaling 4,500 words (.1 percent). Then the redundancy estimates would be as shown in Table 7.

Table 7.
Redundancies of Sections of Isaiah under Alternative Sampling

Section	Chapters	Redundancy
I	1–12	.38
II	13–23	.37
III	24–35	.36
IV	40–48	.24
V	49–57	.35
VI	58–66	.23

Would these results prove the unity of Sections I, II, and III, show Section V to be a dislocated part of the "First" Isaiah, and show Sections IV and VI as forming Deutero-Isaiah? Quite a revolution based on the sampling or nonsampling of four words. Clearly, a criterion this sensitive is better left unused.

Radday next considers the relative frequencies of parts of speech. His results for single, homogeneous books

> appear to ruin all hope of having here discovered a diacritical means for determining authorship. In spite of this, word categories were counted for Isaiah [141] … Sections I and II are very similar and Sections I and IV are diametrically opposed to each other [154].

So, a criterion which fails on control texts is used nevertheless on Isaiah as if the control tests had proved its validity. Abandon triumphs over sound method.

Next come the transitions between parts of speech. Comparing transition frequencies between pairs of samples from a given book discloses few cases where the rates differ from one sample to the other. The table of counts of excess deviations of transition frequencies

> alone makes it difficult to go on assuming that Sections I [chapters 1–12] and III [chapters 24–35] have a common origin and—exactly!—twice as difficult to believe that Isaiah ben Amoẓ who surely wrote Section I [chapters 1–12] also wrote Section IV [chapters 40–48].

He deletes transitions for "parts of speech that are feebly realized," namely, for prepositions plus free pronouns, free conjunctions, residua, and stops. But he retains proper nouns and nonfinite verbs in spite of the fact that these are more feebly realized than some of those categories he has deleted. Radday's measures of similarity are ad hoc. When we examine the transitions (via contingency table analysis), we find that Sections III (chapters 24–35) and V (chapters 49–57), for which Radday shows no results, are more similar than are Sections I (chapters 1–12) and II (chapters 13–23), for which he does show results. Are we to conclude that sections III and V have the same author?

He considers the frequencies of particles. Radday's "control texts are books generally considered as being more or less homogeneous" (1973:198). Included is Genesis. For his six basic sections, Radday finds that the percentage of the vocabulary contributed by his four particles (his *"f_r"*) is as shown in Table 8.

Table 8.
Particle Frequencies in Sections of Isaiah

Section	I	II	III	IV	V	VI
f_r:	6.03	6.04	4.74	2.55	5.79	4.96

From the table, he concludes:

> The special character of Section IV. . . becomes absolute here: Its percentage is not only the lowest, but by 50% lower than the second lowest (Section III). Furthermore, values of Sections I and II are again identical up to one-hundredth p.c. [percent], Section III behaves differently from its neighbours and Sections V and VI are at least not dissimilar.

Arithmetic errors mar this table. Based on Radday's counts, it should read as shown in Table 9.

Table 9.
Corrected Particle Frequencies in Sections of Isaiah

Section	I	II	III	IV	V	VI
f_r:	6.00	4.09	4.71	2.41	5.80	4.94

Sections I and II no longer exhibit uncanny agreement.

And so it continues through vocabulary related to "war," vocabulary richness, and vocabulary eccentricity. Criteria of unproven author-specifying power are introduced. Methods are not explained. Results are generated. Confirmatory evidence is given fanfare. Contrary evidence is explained away. Finally (1973:274–76), Radday reaches five conclusions:

a) The book is composed of two parts, i.e., chaps. 1–35 and chaps. 40–66.

b) The most dissimilar parts are chaps. 1–12 and chaps. 40–48. Since Isaiah ben Amoz was beyond any doubt the author of the first, he cannot have written the latter.

c) Chaps. 13–23 must be ascribed with a very high degree of probability to the author of chaps. 1–12, namely to Isaiah himself.

d) Chaps. 49–57 and 58–66 display so many affinities with each other and so few with the rest of the book that one has to attribute them to yet another prophet.

e) As to chaps. 23–35 the verdict is inconclusive, but they belong in any case to the first part of the book.

Publication of Radday's book (and its predecessor papers) resulted in several commentaries and reviews. Almagor (1971) criticized Radday for relying on impressions not statistics, for ignoring the interrelatedness of his data, and for reaching subjective conclusions. Drake (1971) saw Radday's work as premature, since we do not know how many parameters define an author's style unambiguously, since we do not understand the causes of intra-author variations (audience, form, intent, health?), since it has not yet been shown that two works by the same author are necessarily more similar than two by differing authors, and since we do not know how well one writer can imitate another. Morton (1974) predicted resistance to Radday's work since biblical scholars are "rarely numerate and tend to resist the introduction of new techniques which require them to raise their education by one notch." He wished Radday had demonstrated the validity of his tests, had explained them more fully, and had illustrated the differences demonstrated by giving examples from the text. But that the evidence supported the conclusions "is hardly to be doubted … From now on Old Testament studies in general and the study of Isaiah in particular stand on new ground." Wagner (1977) saw the bulk of the book as devoted to "a well-documented, and indeed, provocative statistical treatment … If you are willing to think through the implications of revising your approach, you should wade through the volume."

It is all but impossible to determine the soundness of Radday's data since chapters, verses, and parts of verses have been deleted and the retained oracles of chapters 36–40 seemingly grafted onto chapters 1–12.

Radday repeatedly makes use of quite short samples of control texts (and indeed of Isaiah). Little concern about sample-size effects is apparent in his work. One must register profound unease regarding this. As to the status of the methods, the safeguards evident in their use, and the conclusions based on their results, the foregoing commentary has repeatedly demonstrated fundamental errors which discredit his results.

b. Adams and Rencher (1973). In response to Morton's favorable review of Radday's work on Isaiah, Adams (1974) tendered three criticisms: (1) the absence of a proper grounding for a method is no excuse for using it as if all were well; (2) the responsibility for proper use of statistical tests rests on their users; (3) Radday's conclusions do not follow from his data. Adams reported: "we applied statistical procedures to data provided us by Radday and found that the results did not support his conclusions" (1974:86). Adams is here referring to his doctoral-thesis work which he and his thesis supervisor published in summary (Adams and Rencher 1973).

Adams and Rencher (1973:151; henceforth A-R) point out that the methods for attributing a text to one of a pair of contending authors, for each of whom one has a body of known work, are quite different from the methods appropriate to the Isaiah problem, where the number of authors is to be determined. This is a sound insight.

A-R (1973:151) contend that for the Isaiah problem, measures of association (similarity) are more appropriate than measures of significant differences. This is a mistaken assertion. Measures of similarity tend to focus on the cohesion among objects, while measures of significant difference tend to focus on their isolation. But A-R certainly are free to use measures of similarity.

To determine the degree of similarity between two texts, A-R rely on the *product moment correlation.* (They also use the so-called *Mahalanobis distance,* which contributes little but complexity to their analysis.) The *product moment correlation* measures the degree of similarity between two objects in terms of their attributes on a scale ranging from minus one to plus one. The more similar are texts, the closer to plus one will be the product moment correlation derived from their attribute values.

As to their choice of author-specific text attributes, A-R assert (1973:151):"Prefix usage is perhaps one of the most pertinent stylistic elements in determining authorship in the Hebrew text." Their quite debatable argument is that the Hebrew proclitic prepositions correspond to habit-prone function words in English, much used in studies of the authorship of English works (for example, Mosteller and Wallace 1984), and hence make good author-specifying markers. Recall that the use of function words has been warned against by Herdan (1966:172–74), Damerau (1975), and Morton (1978:102). For now, let us follow A-R's argument, holding in abeyance scepticism regarding the author-specificity of proclitic-preposition frequencies.

With characterizing attributes selected (Hebrew proclitic prepositions) and with a measure of association decided upon (product moment correlation), the analysts set out toward their two goals (1973:151):

> 1) compare the two major sections in the book of Isaiah with each other and with each of … eleven control texts (inter-text comparison), and 2) examine the book of Isaiah and each of the 11 control texts for internal consistency of style.

This is a sound scenario. Samples are drawn from the eleven control books (Jeremiah, Ezekiel, Hosea, Amos, Micah, Habakkuk, Zechariah, Malachi, Daniel, Ezra, and Nehemiah); Isaiah is divided into two parts (Isa-A [chaps. 1–39] and Isa-B [chaps. 40–66]); for technical reasons, only eighteen of the twenty-four proclitic prepositions they find in Isaiah are studied. From this emerge "perhaps the most salient results of this study" (1973:152), the correlations among the control books and parts of Isaiah. Table 10 shows these.

Table 10.
Corrections between (Samples of) Books

	Isa-A	Isa-B	Jer	Ezek	Hos	Amos	Mic	Hab	Zech	Mal	Dan	Ezra
Isa-B	**.98**											
Jer	.97	.93										
Ezek	.96	.93	.95									
Hos	.93	.96	.85	.87								
Amos	.97	.91	.98	.98	.85							
Mic	.97	.97	.92	.95	.95	.94						
Hab	**.99**	**.99**	.96	.95	.94	.95	.98					
Zech	.93	.86	.96	.93	.78	.97	.85	.90				
Mal	.98	.97	.92	.96	.89	.93	.94	.96	.91			
Dan	.96	.96	.91	.90	.90	.89	.89	.95	.88	.97		
Ezra	.96	.93	.98	.91	.83	.94	.89	.95	.93	.92	.95	
Neh	.92	.86	.93	.88	.75	.92	.83	.990	96	.91	.88	.95

Based on these results, A-R conclude (1973:154):

The correlation between the two sections of the book of Isaiah was 0.98, an indication of overall similarity in rates of prefix usage and nonusage. Only two of the other 77 comparisons were as high.

This is fewer than would be expected from the laws of chance when this many comparisons are made. In fact, only two correlations were *higher* than that between the sections of Isaiah; in all, seven "were as high." The researchers having previously eschewed a probabilistic interpretation of the correlation coefficient, it is curious now to be told that a particular pair of correlations which exceed that found between sections of Isaiah is only to be expected "from the laws of chance." Since the large correlations are used to argue for the unity of Isaiah, one wonders why the argument does not extend to asserting that the single writer of Isaiah also wrote Habakkuk.

A-R next determine a set of nine proclitic prepositions which are "most unique for both sections of Isaiah." The resulting correlations are presented to three places of decimal and disclose that no correlations equal the value of 1.000 obtained for the comparison of the two sections of Isaiah. "Statistical comparisons of intra-text with inter-text variation indicated that a high degree of authorship similarity exists for the book of Isaiah." It is not clear how they arrived at "most unique" proclitic-prepositions. Indeed, this whole line of investigation involves "special handling." Had the researchers not resorted to the fictitious accuracy implied in a display of correlations to three decimal places, their results (rounded to two places of decimal) would have included nine pairs of texts having correlations of 1.00.

There follow brief notes of studies of Hebrew roots unique to Isaiah, of root frequencies, and of phrase repetition. The weight of the study remains, however, on the frequency of proclitic-preposition usage.

As to the soundness of the data upon which the study is based, we have used the Andersen-Forbes (A-F) text of Isaiah to determine the incidence of proclitic prepositions. Since the rates for the eleven control texts are based on random samples, we cannot check them directly. A-R do not give actual counts but rather list counts per five thousand words. The comparisons for the simple proclitic-prepositions are as shown in Table 11.

Table 11.
Frequencies of Prepositional Prefixes

		Isa-A		Isa-B	
Prefix	Meaning	A-R	A-F	A-R	A-F
b-	*in*	688	715	676	673
h-	*the*	7552	787	467	466
w-	*and*	1834	1965	1884	2056
k-	*like*	231	236	219	223
l-	*to*	700	702	863	855
m-	*from*	446	300	521	403

Some of the differences are sizable. For compound proclitic prepositions, the counts are small and A-R find some that we do not and vice versa. When we use our inventory of proclitic prepositions to compute the correlation between Isa-A and Isa-B, we obtain the same value (.98) as A-R. The data seem adequately sound.

When we turn to the adequacy of sample sizes, we encounter the *fatal statistical flaw* of this work. A-R (1973) do not give the size of the samples drawn from the control texts. Adams' thesis (1972) contains the needed information: 500-word samples. These are small samples, especially when one is estimating the frequencies of some quite rare events. The point can be made concretely via two sorts of experiments.

Suppose that rather than using the full texts to obtain proclitic-preposition frequencies for Isaiah, A-R had used 500-word samples. Using random sampling, we draw one sample of 500 words from Isa-A and one from Isa-B. Using the proclitic-preposition frequencies based on these samples, we obtain an intra-text correlation for Isaiah of.87. The correlations for forty-seven of the fifty-five pairings of control texts exceed this value. Are we to infer the disunity of Isaiah?

Alternatively, to show sample-size effects, we can derive proclitic-preposition frequencies for Jeremiah and Ezekiel based on the complete books. The correlations for the full books are closer to unity than were those based on samples, as Table 12 shows. (For comparative purposes, the A-R correlations are included in parentheses.)

Table 12.
Large Sample Correlations between Books

Text	Isa-A	Isa-B	Jer
Isa-B	.98 (.98)		
Jer	.98 (.97)	.94 (.93)	
Ezek	1.00 (.96)	.97 (.93)	.99 (.95)

The superior intra-text homogeneity of Isaiah as compared with the inter-text homogeneity of control books found by A-R is an artifact resulting from inadequate sampling.

c. Weil (1974). Weil (1974:29) is wary of the use of inferential statistics. He rejects much of the work in statistical linguistics because underlying it he finds improper assumptions that data obey the Gaussian distribution and because he sees tests misused. (He asserts that the chi-square test is often used outside its proper domain.) "These considerations have led us, for the moment, to reject the methods of statistical analysis to focus on models that better fit the data we are treating" (1974:30).

Weil opts for the methods of descriptive statistics: factor analysis, automatic classification, multidimensional analysis. While his indictment of the use of inferential statistics is too general, his use of descriptive statistics is certainly acceptable. However, presenting displays of data and challenging the reader to see patterns therein is not all that different from using the methods of inferential statistics in a loosely held manner of the sort advanced by Adams and Rencher. In both cases, probabilities are not attached to results and the reader is left to decide what is significant.

As regards the Isaiah problem, Weil avoids prejudging the composition of text subsets by working in terms of small blocks of chapters (chaps 1–5, 6–10, …, 60–66). For his text attributes, Weil uses the frequencies of occurrence of the hundred most-frequent words in Isaiah. When the chapter blocks are automatically classified via hierarchical clustering, four main clusters emerge: chaps 41–50, chaps 1–35, chaps 51–66, and chaps 36–40. Deutero-Isaiah and the rest split apart first; then the rest divide into Proto- and Trito-Isaiah, with the Kings-parallel chapters "transitional." More recently, using the eighty-nine most frequent words, he obtains an identical pattern of clustering (Weil 1979). Weil has shown that, in terms of the high-frequency words, Isaiah clusters in quite interesting ways. That the frequencies of use of the most frequent words are writer-specific has not been demonstrated, nor is it claimed.

The aforementioned "hierarchical clustering" uses a table of text attributes to compute distances between portions of text. These, in turn, are used to group the texts into explicit clusters. An alternative set of approaches, the so-called "geometrical methods," approximates the distance relations of the texts in a low-dimensional space and leaves it to the human observer to determine which items group naturally into clusters (Andersen and Forbes 1986b; Freedman, Forbes, and Andersen 1991). Weil and his colleagues have used one of these methods, correspondence analysis, to analyze Isaiah (Weil 1979, an extended summary of a fuller exposition in Weil, Salem, and Serfaty 1976). They find that this method, which works in terms of single chapters, yields results quite in accord with those obtained via hierarchical clustering. Most significantly, they validate their results by studying the distances of the various chapters from the centers of the groups they appear to be members of. They also demonstrate that the representation of their data on a plane does not unduly distort the distance relations among the chapters. From the statistical perspective, this is good work.

As regards the soundness of the data, Weil's texts are generally held to be very accurate. That the sample sizes used are sufficient to the task seems assured: by working with blocks of one, three, and five chapters and by using both hierarchical and geometrical methods, Weil and his group demonstrate the stability of their results. Their methods are well understood. They are not without pitfalls, but by

undertaking validating subsidiary studies, Weil and colleagues have put in place excellent safeguards. But as the analysis is entirely based on frequent-word counts, what conclusions are warranted is quite unclear.

2. Oral and Written Composition: Bee (1971). Bee has advanced two notions he finds useful in the analysis of biblical texts. First, the relative frequency of verbs allows one "to identify and classify the units of text … It is necessary to assume that in many cases a difference in origin will be accompanied by a difference in verb frequency" (Bee 1971:406). But changes in subject matter may also affect verb frequency, "thus the exercise of educated judgment is essential." If x_i is the word count through the i^{th} verb, then the plot of i versus x_i, the *cumulative sum chart* of verbs, can be examined to detect changes in verb-usage rate by discerning changes in plot slope. This leads to Bee's second notion: unstressed words are ligatured to their successors by the *maqqeph,* the Hebrew "dash." If one focuses on grammatical issues, one may treat the *maqqeph* as a space, so that each sutured pair is counted as two words; if one focuses on pronunciation, a sutured pair may be counted as one word. Thus, two charts indicating verb-usage rate can be constructed: (1) the MS chart (*maqqeph* separately) and (2) the MC chart (*maqqeph* combined). If the author's attention was on words as grammatical units, as would be expected for written composition, the MS chart would be appropriate for the analysis; if attention was on words as they are pronounced, as would be expected for oral composition, the MC chart would be appropriate. If the "correct chart" shows a plot which is well fitted by a straight line, then there is no change in style evident. By determining which is the better chart for a set of verbs (either by inspection or via statistical tests), one can determine the origins, written or oral, of a piece of text. And by discerning when the slope of the best-fitting line segment changes, one can subdivide texts into units.

In a series of papers, Bee applies these ideas to determine which of a pair of parallel texts is the earlier, to assess the unity of various passages, to determine the pedigree of various Documentary Sources (Bee 1971; 1972; 1973; 1979).

All this is undoubtedly clever, but it is open to devastating criticism. M. P. Weitzman (1981) has presented a quite detailed analysis of Bee's method. His criticisms are that: (1) the tests impute to language an untenable randomness; (2) the definition of "verb" is not straightforward; (3) changes in verb frequency may have causes other than changes in authorship (which Bee has always admitted); (4) the placement of *maqqeph* is quite variable, making its use unreliable; (5) the "work on Deuteronomy displays that selectivity and manipulation which breeds distrust of statistics;" (6) "the test for composite origin is hopelessly over-sensitive;" (7) "the test for oral or written composition is also over-sensitive." Bee (1983) responds to Weitzman's criticisms, successfully refuting the first, but the rest must stand. (Bee has also proposed a prophetic-text dating formula. Consult Becking's critique [1980] with Bee's response [1980], which provide entry to a series of papers.)

3. The Documentary Hypothesis. a. Chenique (1967). The bulk of Chenique's unpublished thesis deals with the issues addressed as he and G. E. Weil prepared Hebrew texts for computer analysis. One chapter (III, forty-four pages) gives sketchy results of analyses of the first eleven chapters of Genesis. He subdivides the chosen chapters three ways: (1) CREATION (1:1-6:8, 146 verses) versus DELUGE (6:9–11:32, 153 verses) versus TOUT; (2) YAHVISTE (J, 147 verses) versus ELOHISTE (P, 152 verses), as defined by the Jerusalem Bible; (3) Genesis chapter 1 (31 verses) versus 3 (24 verses) versus 9:1–17. The first two subdivisions involve ample text samples.

As relevant text characteristics, he investigates grapheme frequencies, word length (in "letters"), text entropy, and word rank-frequency relations. There is no attempt to assess the author-specifying power of these text characteristics. (The work of Pierre Guiraud is, however, cited.)

The statistical tests used are quite simple, consisting of checks for overlapping of confidence intervals and tests for significance of differences in means (t-tests). These sorts of tests were earlier used by Morton and later by Radday and associates. (They have since been repudiated by Weil as inappropriate.) Unfortunately, Chenique looks for significant differences via *marginal analyses.* That is, he studies the behavior of his attributes for each sort of subdivision separately (CREATION versus DELUGE, YAHVISTE versus ELOHISTE, Chapter 1 versus Chapter 3, and so on). This strategy can be quite misleading when there are interactions among the sets of variables treated separately.

Having found significant differences between the YAHVISTE and ELOHISTE as regards grapheme frequencies, Chenique states that their explication is not for statistics but for exegesis to determine (1967:III.5). On finding the information content (in terms of letter entropy) to be greater in DELUGE, YAHVISTE, and Chapter 3 than in CREATION and ELOHISTE, he remarks that the hypothesis of two or more "languages" is not proven thereby, but is retained for verification later (1967:III.9). (He does assert that entropies are characteristic of an author [1967:III.9].) Using the ratio of vocabulary items (V) to total words (N), he finds the vocabulary of the YAHVISTE to be richer than that of the ELOHISTE (1967:III.13).

S. Talmon characterizes Chenique's conclusions thus (Talmon 1985:227):"François Chenique … submits that an analysis carried out with a *calculateur électronique* underpins the Documentary Hypothesis respective to Genesis ch. 1–11." This claims neither too much nor too little.

b. Weil (1974). Weil and co-workers have studied the Pentateuch in some detail. In their early work (1974:30), they analyze the chapters of the Pentateuch using *grapheme counts.* They discover four clusters, which Weil finds related to the types of wording they embody: (1) declarative promulgation of law, (2) imperative promulgation of law, (3) general narrative, and (4) reports of censuses, trips, and battles. Weil outlines two clusters, the Pentateuchal books forming a banana-shaped cluster almost touching the pear-shaped cluster of the Prophets. The chapters of Exodus cluster in terms of their themes. Weil remarks that analyses have been carried out based on grapheme sequences, counts of frequent words, and "rare linguistic facts." Neither details nor results are given.

He also introduces an interesting method of studying discourse type. He examines the behavior of $\frac{NV - NP}{NM}$, where *NV* is the count of verbs in a text, *NP* is the count of particles, and *NM* is the count of words ("mots"). When this index is positive, one is dealing with poetry; when it is negative, one is dealing with prose.

In other work, Weil (1981a) analyzes the clustering of the chapters of the Pentateuch and examines the distribution of parts of speech across the Pentateuch and the three Major Prophets.

c. Radday et al. (1982). First in a journal article (Radday et al. 1982) and then in a monograph (Radday and Shore 1985), Radday and his colleagues have taken up the Documentary Hypothesis for Genesis. Because of serious implications for this study, we first take up several issues from A. 3 above.

Data Soundness: Each word of Genesis from the Letteris text of 1852 is labeled with its grammatical specifics, its length in phonemes, its affixes, which Documentary Source it is from (J, E, or P), its citation, and whether it is human direct speech (H) or divine direct speech (D) or narration (N).

It is with the choice of version of the Documentary Hypothesis that one must take strenuous issue. Radday assures us that should strong results emerge from his sources, one might expect quite similar results using assignments "in a somewhat modified form" (1985:19). Using the Andersen-Forbes text of Genesis, we find the differences between Radday's and Eissfeldt's assignments (from his *Hexateuchsynopsis*) shown in Table 13. The rows are Radday's assignments, and the columns are Eissfeldt's. Thus, Radday assigns 9,100 words to J of which Eissfeldt assigns 7,247 to J, 1,459 to E, and 394 to P. And so on. (We have compounded neither numerals nor toponyms. We have removed 573 words formatted as poetry in BHS.)

Table 13.
Radday versus Eissfeldt Document Assignments

	Eissfeldt			
Radday	J	E	P	Total
J	7247	1459	394	9100
E	3283	3221	282	6786
P	517	21	3551	4089

Total 11047 4701 4227 19975

Overall, thirty percent of Radday's assignments differ from Eissfeldt's. (For J, 20%; for E, 53%; for P, 13%.) Crucially, Radday's analysis does not confront a Documentary Hypothesis most would recognize.

In a commendable move to allow others more fully to assess their work, Radday and co-workers (1985:237–52) have published the data upon which their book rests. We have spot-checked two of their text samples, Sample #1, and Sample #29. (These were picked because they are the first narrative samples of P and of J [1985:25].)

Study of Sample #29 (1985:241) discloses one sort of difficulty. Its smallest entry is.485 percent, which we take to correspond to a count of one divided by the sample size, yielding a sample size of 206 words. According to Table 1.3 (1985:25), the material beings at Gen 2:5 and runs through Gen 2:19; according to Table 1.1 (1985:20), the material begins at Gen 2:4. The stretch from Gen 2:4 through Gen 2:19 is 211 words long. Deleting Gen 2:4 reduces the sample to 206 words. (Not only has Gen 1:2–2:3 been dropped on the mistaken grounds that it is poetry, but Gen 2:4 has been dropped inadvertently.) As a check, we count the number of definite articles and the number of potential carriers of the article. The ratio of these two is Radday's criterion #18. We obtain $\frac{42}{65} = .64615$, which is exactly what Radday has. But there is a lapse involved in the definition of Sample #29. It is the first of the J narrative samples (NJ). In fact, there are twenty-seven words of divine speech (DJ) embedded in the sample, eighteen words in Gen 2:17 and nine words in Gen 2:18. Thus, the sample is not pure J narrative. This raises concerns about the labeling of the data in general.

Examination of Sample #1 raises other concerns. Radday analyzes in terms of fifty-four "criteria" computed for each text sample (of around 200 words). Criteria #1–#10 give the relative frequencies, in the given text sample, of words having two, three, …, ten, and greater than ten phonemes. Thus, adding a sample's table entries for the first ten criteria together should yield 100%, as it does. (Note that these ten criteria are not independent, since knowledge of any nine allows determination of the tenth.)

Radday divides his vocabulary into five families (noun [N], finite verb [F], nonfinite verb [V], preposition or pronoun [P], and "coordinating conjunctions, adverbs and the rest" [C]). The lumping together of prepositions and pronouns is passing strange, as is the "ragbag" nature of the C class. He uses "L" for proper names, "in most counts added to N." Adding a symbol for the stop at the end of a verse (S), he reckons the relative frequencies of the thirty-five transitions theoretically possible among these six categories. Criteria #20–#25 describe noun-to-something transitions (N (ρ)?); #26–#31, finite verb-to-something transitions (F (ρ)?); #32–#37, nonfinite verb-to-something transitions (V (ρ)?); #38–#43, preposition or pronoun-to-something transitions (Π (ρ)?); #44–#49, chaff-to-something transitions (X (ρ)?); and #50–#54, stop-to-something transitions (S (ρ)?).

Study of the transition data leads to several unsettling observations. (1) In the summary table of the criteria set (1985:30), Radday has "subordinative conjunctions" in all the places we expect the residue class (C). This is probably a typographical error, "coordinating conjunction" (C) having been intended. In any event, there is a problem. We know from the entry for criterion #17, and have verified directly, that there is one subordinative conjunction in the sample, followed by a finite verb. But, for Sample #1, the table gives criterion #45, C (ρ) F transition, as.0000.

(2) A grammatical classification which includes a category for "the rest" is exhaustive. Thus, if one sums over criteria #20–#54, one should get a sum of 100%. One does not. For example, these criteria sum to 77.05% for Sample #1. Some transitions have been left out. Which are they, and why are they missing?

(3) Radday (1985:29) informs us that of the fifty-four criteria, "nos. 24, 30, 36, 42–49, and 54, altogether eleven, are not realized at all in Genesis." In point of fact, there are many non-zero entries for criterion #43. The remaining ten criteria are precisely just those involving the residual class of words (C). This means that the class consisting of "coordinating conjunctions, adverbs and the rest" (C) is *empty* in Genesis. This can not be. What has gone amiss and at what stage of the analysis?

Sample Size: A sample size of 200 words per sample is adopted from the outset (1985:23). Later, a reason for using 200-word samples is given (1985:60–61), but this sample size results from the unexplained decision "setting the criterion that no fewer than three samples be available for any of the nine cells" in the table of the combinations of document and type of discourse (1985:62). In fact, *two* cells, not one as Radday states, have too few words to allow three 200-word samples. Note that many of the criterion values for a sample will be determined by sampling considerably fewer than 200 words. For example, the definite-article criterion (#18) is the fraction of words having the article relative to all those that in theory could. Over the entire book of Genesis, about 20 percent of the words are potential carriers of the definite article. Thus, on average, the incidence figures for the definite article are based on about forty words per sample, quite a limited number. Recall the spurious effects 500 word samples produced in the study by Adams and Rencher.

To summarize, the use of an atypical version of the Documentary Hypothesis, an evidently mislabeled data set, criteria incorrectly said to equal zero, and the use of too-small samples all make us very wary of the results obtained by Radday and co-workers. These major limitations by no means exhaust the list of problems one encounters in the Genesis study.

Were there sufficient space, one might discuss other problems involving: an ignoring of the possibility of outrageous events (1985:13); a more-the-merrier attitude regarding additional criteria (1985:27); an ignoring of the possibility that criteria may be *supra-stylistic* (1985:28); a use of myriad, very similar methods as though the weight of evidence resulting therefrom was piling ever higher; modification of methods because of "disappointing results," without showing the nature of the disappointment for the reader to judge (1985:97); use of dendrograms with rampant chaining (1985:135); use of two-dimensional displays for multidimensional scaling results on the grounds that higher dimensions are more difficult to interpret (1985:146); introduction of elaborate, ill-motivated measures of vocabulary richness and concentration (1985:191–214); typo-riddled presentation of the Sichel distribution (1985:259–60); and *most serious of all,* repeated reliance on potentially very misleading marginal analyses (1985:*passim*). See also the critiques by Portnoy and Petersen (1984a, 1984b) and Weitzman (1986a).

Demonstrated Power of Methods: In the monograph, there are several references to previous work as having demonstrated the validity of various approaches (1985:13, 27–29, 45). The references are to the previously discussed monograph on Isaiah (Radday 1973), to an extended paper on Zechariah (Radday and Wickmann 1975), and to a treatment of Judges (Radday, Leb, Wickmann, and Talmon 1977). Space limitations prevent exposition of the work on Zechariah and Judges. The methods are essentially the same as those used in the Isaiah study. And, as with that study, one must question both the measures used and the conclusions based on their apparent behavior.

Safeguards in Use of Methods: Our spot-check of two of the data samples brought out problems suggesting that adequate safeguards were not used. (We note Radday's comment regarding the discovery of major error in his initial analyses of Genesis [1985:31].)

Conclusions Drawn from the Statistical Results: The attitude of Radday and his co-workers regarding inferences drawn from their criteria sets has fluctuated considerably. In his earliest work, Radday was confident his criteria were author-specific (Radday 1970:320; 1973:*passim*) and inferred multiple authors (Radday 1970:324; 1973:274). The work on Zechariah was more cautious. The possible confounding effects of changes in genre, subject matter, and author's age were admitted, and the detection of caesura was announced with multiple authorship only implied (Radday and Wickmann 1975:42, 47, 54). In a study of the use of the definite article, some variations in rates of use were attributed to changes "in subject matter and/or literary type" while other variations were attributed to differing authors (Radday and Shore 1977:25, 26). In the work on Judges, the introduction of criteria as author-specific was justified by phrases such as "one feels inclined to believe that …" and "… may be assumed to characterize him although the matter has so far been insufficiently examined" (Radday, Leb, Wickmann, and Talmon 1977:478). The outcomes of the statistical tests were, however, viewed as author-specific (Radday, Leb, Wickmann, and Talmon 1977:492; also Radday and Shore 1977).

In an interesting study of the Five Scrolls, differences in vocabulary concentration (the fraction of the text accounted for by the fifty most frequent words) were seen as due to differing authors or differing stages in one author's career (Radday and Pollatschek 1978). A vocabulary concentration study of Postexilic Prophets (Radday and Pollatschek 1980) was badly marred by inadequate exposition of method. A survey which introduced a new pair of measures of vocabulary characteristics concluded with a brief treatment of richness and concentration in Genesis. A plot of richness versus concentration was produced which induced marvel in the researchers (Pollatschek and Radday 1981:222 and figure 6). Note the quite different plot, based on the same material, in Radday, Shore, Pollatschek, and Wickmann (1982:477).

In the Genesis research, all results showing nonhomogeneity between documents are explained away. We shall let one extended quote make the point (1985:182–83).

> Let us concern ourselves with the just mentioned distinctness between NJ [narrative J] and NE [narrative E]. Too much weight need not be accorded to it … NE takes over when NJ fades out and precisely where a break occurs in the treatment of the central figures … Little wonder, then, that NJ is not uniform with NE, and there is no reason why the two should be ascribed to two different hands. To every intent, therefore, J and E seem to be one. Carrying this reasoning further, one may add that it explains also the seemingly singular language behavior of P … The unique character of P must be due to the lack of balance in subject matter between what Documentarians ascribe to the Priestly Writer and what they credit to the Yahwist or the Elohist.

One can easily envision some other researcher not making the foregoing arguments and concluding that the texts under study are from multiple hands. Here we see starkly the extreme flexibility which discredits most authorship studies. Even when the statistical work is done with great rigor (which rarely is the case), the final inferences too often involve blatant arbitrariness.

Rosenhouse (1986) has written a minimally critical summary of this work. Parunak (1987) finds commendable the team approach, the use of multiple methods in assessing the data, and the inclusion of the data upon which the results rest. He laments the sketchiness of the statistical exposition, the over reliance on the independence assumption, the nonuse of the most sensitive methods of data exploration, and the underuse of graphical displays. Weitzman (1986a) briefly summarizes the work, homing in on many of its basic imperfections. His ultimate judgment is that "[Radday's and Shore's] concluding claim of 'massive evidence that Genesis is a unity' (p. 190) is a massive *non-sequitur*."

d. Others (1977–1986). For completeness, we include, with minimal comment, notice of other work dealing with the Documentary Hypothesis. (1) Deist (1977) concludes that Eissfeldt's L-source and J-source are not dissimilar by examining the differences in frequencies of occurrence of various syntactic characteristics. (Inferential statistics are used in a loose way.) (2) Houk (1983) studies word-length distributions (in terms of syllables) in Genesis 12–23. Analyzing J, E, and P "significant difference between the three kinds of material is found" (1983:192). When the halves of J, of E, and of P are compared (intra-document homogeneity), "the disunity evidenced goes against any large scale unity of composition" (1983:193). (The implications of significant intra-document nonhomogeneity for judging inter-document nonhomogeneity are not addressed.) For a study along similar lines of Ezekiel 1:1–3:11, in which multiple authorship is concluded, see Houk 1981. (3) Andersen and Forbes (1987) present tables of counts (sans statistical analysis) for the Pentateuch using forty different *genres* and Eissfeldt's eleven sources. (Interpretive comments are sparse and very cautious.)

4. Other Investigations of Style/Use. Hoftijzer (1981) investigates the incidence of *H-locale* (the suffix *-h* on a substantive indicating motion toward a place) relative to places it might appear and examines the significance of differing rates of use via confidence-interval overlap. (Parunak [1983] has written a helpful review of this work.) Parunak (1981) uses clustering methods and tests for cluster significance in creative ways to produce what he terms "pictorial concordances." His plots allow one to *see* clumps of vocabulary in texts. By examining his "density plots" for intersections, new hypotheses might well be generated. Forbes (1987) studies a measure of syntactic organization (part-of-speech entropy) across the

Hebrew Bible, seeking simple models of text organization and differentiating texts by the conditioning of later upon earlier syntactic units.

5. Spelling in the Hebrew Bible: Andersen and Forbes (1986a). Andersen and Forbes (1986a; henceforth A-F) investigate whether sufficient orthographic individuality, regarding the use of *defective* and *plene* spelling, has survived repeated copyings to allow portions of the received text to be grouped in terms of spelling patterns.

The data preparation required to execute the study is substantial. First, based on what is known about the development of Hebrew spelling, certain vowels are marked as historically fixed (1986a: 126–49). For example, since all but six of the 55,439 word-terminal vowels in the Hebrew Bible are written *plene* (1986a: 111), the class of word-terminal vowels is judged historically fixed. Since such vowels bear no discriminatory information, they are dropped from further consideration. There are other vowels in particular lexemes which might be spelled *defective* or *plene*, but which are always or almost always spelled in one way. These, too, are dropped as being empty for purposes of discriminating portions of texts. If one can assert, with 95 percent confidence, that the deviant spelling for a lexeme would occur in less than 1 percent of a lexeme's appearances in an enormous text, the associated vowel is declared fixed in its spelling on statistical grounds (1986a: 151–54). For example, *kōl* ("all") is spelled defective 852 times and spelled *plene* once. It is considered of fixed spelling.

After fixed vowels are eliminated, the *ketib* text contains 108,943 vowels which were opportunities for spelling choice at some point in the development of Hebrew spelling. Since the vowels developed along individual lines, A-F next define sixty-five vowel types and label each opportunity as to its type (1986a: 162–204). Some vowel types refer to classes of words ("Type 1. Suffix -ī- on finite verb"), while others are specific to a single lexeme ("Type 33. *Nota accusativi* ʾ*ōt*"). As there is evidence that some spellings might be conditioned by "stress level," each spelling-choice opportunity is labeled as to stress ("low," "middle," "high").

Having specified sixty-five vowel types, three levels of stress, and two choices for spelling, the text is next divided into portions. Here, the problem of sample size is encountered (1986a: 205–13). For a complete analysis (in terms of all four variables), statistical requirements dictate that no more than seventy-six portions be used. The text of the Hebrew Bible is divided accordingly, keeping the samples of roughly equal size where possible and making divisions in terms of scholarly interest (Proto-, Deutero-, Trito-Isaiah) or subject matter (Joseph Cycle as a single portion). When analysis involves a single type (as when one asks if spelling choice and portion are associated for a given vowel type), fewer portions may be allowed due to the paucity of vowel opportunities making up the type.

Statistical analyses can lead to very misleading results if important variables are left out of account. Therefore, the final preparatory step is to examine the behavior of spelling in terms of a trio of possible "confounding variables":proximity, local frequency, and stress. The interval between instances of a lexeme has almost no effect on spelling choice (1986a: 214–7). Thus, proximity is not a confounding variable. Spelling choices made when an item occurs frequently in a portion do not differ radically from choices made when it occurs infrequently. Thus, local frequency effects appear unimportant (1986a: 221–30). Stress, however, does exert an influence on spelling choice for certain vowel types. The overall effects of stress, however, are quite puzzling. The spelling of vowels under "high" stress is not more frequently *plene* than that of vowels under "middle" or "low" stress (1986a: 230–39). Ways of accounting for stress effects without treating the stress category as *ordered* are therefore used.

The data having been winnowed, labeled, and examined for confounding influences, the main analysis proceeds in two stages: (1) determination for each type as to whether it shows interaction between choices of spelling and text portion, and (2) clustering of the text portions into affinity groups exhibiting similar spelling practices.

Demonstrating that spelling patterns have survived transmission involves: (1) assessing how best to handle stress for a given vowel type, (2) analyzing the spelling behavior across portions (looking for anomalies and deciding if these result from the dominating effects of a few lexemes or reflect pervasive association of spelling choice and portion), and (3) displaying evidence that the patterns of spelling choice

do indeed depend on portion (1986a: 240–87). One finds that some vowel types show spurious spelling choice-portion association (due to extremely localized aberrant spelling practice) and others show no association. But the majority of vowel types, especially those for vowel /ō/, manifest an association between spelling choice and portion. This is the first major result of our analysis.

Having demonstrated that useful spelling-choice information remains in our texts, the final task is to cluster the text portions into groups exhibiting similar practices. A helpful way of visualizing the similarities in the spelling patterns of the text portions is to compute measures of their distances apart and use these to form *dendrograms.* Fig. STA.03 shows one such dendrogram. It may be viewed as a tree laid on its side, its branches pointing to the left, its root to the right. Its leaves are text portions. Its branches link similar text portions or groups of portions. Leaves joined by branches "high" (leftward) in the tree are very similar. Branches which join "low" in the tree link relatively dissimilar clusters. Thus, in Fig. STA.03 we see that the two most similar text portions are Exodus 25–31 and Exodus 32–40, since branches join these leaves at the highest (left-most) level of the tree. Joshua 1–12 is the single most disparate portion in that it is the last leaf to join the tree.

Such a dendrogram contains details which make immediate sense, as when portions of the same book turn out to be similar. Other joins are surprising and invite closer scrutiny. For example, the portions of Isaiah are closer to portions of other books than they are to one another.

The spelling practice in the Pentateuch sets it quite apart from the rest of the Hebrew Bible (1986a: 288–308). The Pentateuch prefers old-fashioned spellings in many cases. This is the second major result of our analysis.

There could be several explanations for this. Perhaps the manuscripts of this part of the Bible came from a different community, one with different spelling practices, than the source of the rest. Perhaps it enjoyed greater veneration and so resisted modernization. Perhaps it is older than the rest. More study is needed.

As to the soundness of the machine-readable text used, the A-F text has been checked repeatedly and via multiple approaches over the fifteen years during which it has been created. Its consonantal text has been collated against that of Weil. The grammatical assignments have also been thoroughly checked. In general, the various word and category counts for the text are in agreement with Weil's published counts (1981b).

Sample sizes have been determined in accordance with conservative statistical practice, and analyses have been carried out with a range of sample sizes so as to allow assessment of the robustness of results.

The inferential methods used to show that the spelling in the texts has not suffered total randomization due to copying errors are applicable under very general conditions (1986a: 123). The descriptive methods of clustering are well understood, and their results have been verified via geometrical methods (classical multidimensional scaling [1986a: 330]). The major limitation of clustering methods, their forming of clusters no matter what data are supplied them, has been controlled for by clustering with related data sets and by computing measures indicating cluster reliability (1986a: 300–8). In addition, other distance measures and methods have been used, leading to quite similar results (Andersen and Forbes 1986b; Freedman, Forbes, and Andersen 1991).

The accuracy of the results has been safeguarded by carrying out the data preparation using standard computer utilities, by performing cross-checks and counts to verify data integrity at each stage, and by using a standard statistical package for the analysis (Andersen and Forbes 1989).

Known shortcomings have been described in the Epilog (1986a: 329–31), and steps have been taken to address them (Freedman, Forbes, and Andersen 1991). As to the conclusions drawn from the results of the statistical analyses (1986a: 309–28), others must be the final judges.

Several reviews of the work have been published. Campbell (1986) sketches the goals and methods of the work and presents a few of the results. He concludes: "Despite their attempts to keep it intelligible, this is not a book for the faint-hearted; but it is an important book which must be given careful study." M. S. Smith (1987), in summarizing the work, finds areas he feels need more attention: the details of spelling practice in the inscriptions, the respective roles of scribal choices (if any) and copyist alterations, the effects of text apportioning on results. He hopes "that further study will touch more directly on the

questions of textual origins, transmission, etc …" Barr (1988) severely criticizes the work for so imposing the orthographic theories and categories of Cross and Freedman upon the data as to nullify "the value of the computer as a means to objectivity." He remarks that Andersen and Forbes give the impression "that they have no idea at all that other possibilities exist." For Barr, spelling "depends, in large measure, not on the time when the passage was written but on the textual history of the book in which it is found." Contrary to Barr's claim, Andersen and Forbes are well aware of this hypothesis and consider it extensively (Andersen and Forbes 1986a; 102–4, 115–16, 124–25, 241–46, 289). Repeatedly, Barr asks why certain information is missing. Much of it is present, as the indexes reveal. Barr unfortunately misunderstands the book, largely because he addresses the problem of the statistical analyses by "leaving aside the mathematical material" (ignoring two-fifths of the book). Hamilton (1988) states that Andersen and Forbes "succeed admirably in accomplishing each of [their] major goals … Their results are often startlingly fresh, even if their statistical methods sometimes may be incomprehensible to a general reader." He is frustrated by the lack of extensive examples of each vowel type, the lack making him "suspicious of the degree to which [he] can rely on [the] final statistics." He concludes: "The statistical denseness and opaqueness of *Spelling in the Hebrew Bible* may hamper it from taking its deserved place as the standard reference work on this complex and difficult subject." Pardee (1988) has two main criticisms of Andersen and Forbes: (1) They limit the term spelling to *matres lectionis*, only minimally developing a "clear-cut model of the cultural conditions that created the conventions for the use of m. l." (2) They fail "to take seriously the diversity of orthography in the late preexilic Hebrew inscriptions." Pardee concludes: "We are heavily in their debt … for the reliable presentation of data and statistical analysis that they have provided."

E. Concluding Remarks

By now, a pattern has emerged. With distressing regularity we have seen: (1) a lack of sensitivity to the subtleties of sample-size specification, (2) a misconstruing of previous investigations as providing justification for one's current work when they do not, (3) a cavalier attitude regarding the necessity of safeguards against data-processing mishaps, and (4) a careless pedagogy wherein basic concepts are not explained or are explained sloppily. Most distressingly, we have repeatedly seen investigations embarked upon with sweeping claims of assent-demanding objectivity only to witness their ultimate invalidation through special pleading and selective attention to results. One need not be a statistician to detect when an outcome has hinged on researcher/thaumaturge and audience blinking at critical moments.

A harsh indictment, one too often true of statistical analyses. For example, statistical errors have been found in around half of the papers published in a representative set of North American medical journals (Glantz 1981:6–9). Referring to the general statistical literature, Mallows and Tukey (1982:163) ask why arguments based on statistics so often fail to convince. They reply that: (1) procedures are often inadequately explained, (2) conclusions are often suspect because the assumptions underlying methods are not clearly met by the data, and (3) the relevance of the data to the questions asked often has not been demonstrated. The shortcomings of statistical biblical research are typical of statistical analyses in general.

The solution is *not* to forswear statistics but rather for its users to explain their work clearly, to make explicit the *assumptions* upon which their analyses rest, and to give up the pretense that conclusions based on statistics are without presuppositions. Many areas of biblical studies can profit greatly from the careful application of statistical methods.

STELES OF SETH. See SETH, THREE STELES OF (NHC VII,5).

STEPHANAS (PERSON) [Gk *Stephanas* (Στεφανας)]. A Christian from Corinth whose household Paul identifies as "the first converts in Achaia" (1 Cor 16:15). Stephanas (whose name means "crown") was the head of a household in Corinth important enough for Paul to mention twice in 1 Corinthians (1:16; 16:15–17). Along with Fortunatus and Achaicus, Stephanas was part of the delegation from Corinth that visited Paul in Ephesus (16:15–17).

Stephanas' household were among the very few baptized by Paul in Corinth (1:16). According to Paul they were in fact the "first fruits" *(aparchē),* understood as the first converts, of that region (16:15). However, Acts 17:34 offers a conflicting account, implying that Paul's conversion of the Athenians (thus also Achaians) Dionysius, Damaris, and others, took place before Paul ever got to Corinth. Ramsay explains the discrepancy by saying that Stephanas' household were the "first fruits" of a church or community established by Paul in that region (1920:385). Others suggest that Paul meant "first fruits" of Corinth.

Those who belonged to Stephanas' household (*oikos* in 1:16; *oikia* in 16:15) are not further identified. Such a household may have included male and female family members, freedmen and women, and/or slaves. Due to their leadership role mentioned in 16:15–16, those referred to by Paul would be adults, whether male or female. This, however, does not preclude the presence of children. It is sometimes suggested that Fortunatus and Achaicus, named immediately after Stephanas, were part of that household. Though possible, this is uncertain because household members would probably not be singled out by name apart from the global designation and because the delegates sent by the Corinthians would undoubtedly be from more than one household to provide a broader representation of the community.

Stephanas and other members from his household "appointed (see Fee *1 Corinthians* NICNT, 829, n. 21; RSV has "devoted") themselves to the service *(diakonia)* of the saints" (1:15). Though appointed

neither by Paul nor by the local community, their service rendered is reason for Paul to commend them as worthy of exercising leadership in Corinth (1:16). The service offered, not further specified, was likely expressed as: (1) being ministers of the gospel by teaching and preaching (Fee ibid., 830), and/or (2) being patrons or benefactors of the community, for example, by providing hospitality in the home (Meeks 1983:58). Probably not intended is activity relating to the collection for the poor in Jerusalem (designated by similar phrases in 2 Cor 8:4; 9:1, 12–13) since nothing in the context suggests this. Because of their role as benefactors, Meeks suggests that Stephanas was fairly well-off, though probably not as high in socioeconomic status as Gaius or Crispus (see 1 Cor 1:14; Acts 18:8; Rom 16:23).

That Paul gave his full support to the leadership position of Stephanas' household in the community suggests that they remained loyal to Paul amidst the divisive partisanship (1:12), and hence they are probably to be included among "Paul's people" in the community (cf. 1:12). Upon the arrival of Stephanas along with Fortunatus and Achaicus, Paul rejoiced, for they made up for the "lack of you" *(humeteron husterēma*) which Paul keenly felt (16:17). Was this "lack" the physical absence of the community sensed by Paul (so most commentators) or an obligation felt by the Corinthians to labor along with Paul in missionary activity (Ollrog 1979:97–98)? The text does not clarify the matter. Paul also remarks that their presence refreshed his spirit (16:18), apparently because they relieved some of his worries about the local church in Corinth.

It is not clear what Stephanas' leadership status was among the Corinthians. Did he have the full support of the Corinthians, or was his role challenged by some (cf. 1:16)? Did some at Corinth doubt the wisdom of asking Paul for advice, and oppose sending a delegation (cf. 1:12)? Was Stephanas sent because his household was Paul's "first fruits," and hence had a special relationship with the community's founding apostle? Did Stephanas and company bring a letter to Paul with some disturbing reports about community life (see 7:1; cf. 7:25; 8:1; 12:1)? Was Stephanas one of those who persuaded the church to send the letter? If he did bring the letter with its troubling news, Paul was nonetheless refreshed in spirit at the arrival of Stephanas, Fortunatus, and Achaias. Finally, were Stephanas and his companions the messengers who took 1 Corinthians back to the community? This is likely, since Paul exhorts the church to recognize these individuals (16:18), implying their return and perhaps their position as interpreters of the letter.

JOHN GILLMAN

STEPHEN (PERSON) [Gk *Stephanos* (Στεφανος)]. One of the seven chosen by the Twelve to serve tables; he was the first Christian martyr (Acts 6-7). At the time that complaints were formulated by the Hellenists against the Hebrews, about the way in which their widows were treated when they were being assisted by the Christian community, Stephen and six other Hellenists were chosen to handle service of the tables and thereby free up the apostles, who could then give themselves over to service of the Word (Acts 6:1–7). Later on, some Jews of the "Synagogue of Freedmen," unable to reply to the arguments that Stephen expounded against them, bribed several people to speak calumnies against him before the people (6:8–11). He was haled before the Sanhedrin where new accusations were pronounced against him (6:12–15), and this gave him the occasion to proclaim a lengthy discourse of self-justification (7:1–56). Once enraged, the members of the Sanhedrin dragged him out of the city and stoned him (7:57–60), after which he was solemnly buried (8:2).

F. Stephen and Paul

A. The Hellenists

These narratives in Acts present commentators with serious difficulties. First of all, who were these Hellenists to whom Stephen certainly belonged and which Acts 6:1 sets over against the Hebrews? According to some commentators, the Hellenists and Hebrews—most certainly Christians—can be distinguished by the fact that the former would have come from among the gentiles while the latter would have been converts from Judaism. In this view, Stephen would be of gentile origin. But it seems preferable to make a different kind of distinction between these two groups (Hengel 1975; Pesch 1979). In actual fact, the Hellenists who wanted to kill Paul in Acts 9:29 were certainly Jews, as were the Hellenists mentioned in Acts 11:20. The distinction between Hellenists and Hebrews, then, was one that already existed in Judaism: the Hellenists would have been hellenized Jews, that is, ones who had adopted the language and a certain number of the customs of the Greeks; the Hebrews, on the contrary, would have been Jews who had preserved the purity of their hebraic culture. This distinction was kept up in early Christianity: the Hellenists were Christians who had come from Jewish milieux that had been hellenized to a greater or lesser degree, while the Hebrews derived from Jewish milieux which had kept the purity of their hebraic culture. But members of both groups were converts from Judaism. Stephen's name was Greek, derived from the word *stephanos,* "the crowned one"; like the other Hellenists, he had adopted, while still a Jew, the Greek language and a certain Greek life-style. See HELLENISM.

A second problem is posed by the account of the election of the Seven, among whom was to be found Stephen (6:1–7). According to this narrative, the Seven were chosen by the community to serve the tables and in this way permit the apostles to dedicate themselves to the ministry of the Word. Yet afterwards, this service of the tables completely disappears from the horizon of Acts; besides this, Stephen and Philip are shown to be given over to service of the Word just like the apostles: Stephen at Jerusalem (6:8–7:60) and Philip in Samaria (8:5–40). Indeed, Philip elsewhere in the early tradition retains the title of an "evangelist" (Acts 21:8). In light of this fact, a certain number of commentators think that the present narrative in Acts must be the reinterpretation of a primitive account bent on addressing a later situation of the Church. In the primitive account, the problem that would have set the Hellenists against the Hebrews would have been that of Christianity's openness to the pagan world. The Hellenists were favorably disposed towards this movement, almost by the very fact of their Greek upbringing, while the Hebrews were more or less openly opposed to it, basing themselves on one or another of the sayings of Jesus (Matt 10:5–6). For the Hellenists, this crisis would have been the occasion to establish a certain independence with respect to James and the Jerusalem church (Trocmé, 1957:188–91). Stephen would thus have been one of the first defenders of openness on Christianity's part to the gentile world, the very position which Saul (Paul) would later on champion. With regard to the problem of service of the tables, an echo of which is still to be found in Luke 10:38–42, this issue likely did not arise until several decades later.

B. A Popular Riot

The circumstances surrounding the death of Stephen are likewise a problem. A number of commentators admit that the present narrative in Acts is not homogeneous. In their view, an ancient narrative, according to which Stephen would have been stoned during a popular riot, has been amplified by all those features which in the present account involve his appearance before the Sanhedrin, including Stephen's long discourse. One finds this hypothesis laid out, with important qualifications, in the commentaries elaborated, from one perspective, by P. Feine (1891), F. Spitta (1891), J. Jüngst (1895), F. J. Foakes-Jackson and K. Lake (1922), O. Bauernfeind (*Apostelgeschichte* THKNT), G. Stählin (*Apostelgeschichte* NTD); and, from another perspective, by B. Weiss (1889), H. H. Wendt (*Apostelgeschichte,* MeyerK) A. Harnack (1908), as well as in the treatments of H. W. Surkau (1938:105–19), E. Trocmé (1957:183–91) and J. Bihler. Though contested by the "western" tradition of the text of Acts: at 7:57, the Fleury palimpsest (h) and the Coptic codex G^{67} explicitly say that it was "the people" who rushed forward to Stephen to drag him out of the city and stone him. According to the ancient narrative, the circumstances of Stephen's death were as follows: Stephen had enjoyed a great deal of success in his preaching before

the people, due in part to the signs and wonders which he had performed (6:8). Enraged that they were unable to counter his arguments in favor of Christianity, the Jews of the "Synagogue of Freedmen" bribed some people into accusing Stephen of having uttered blasphemous words against Moses and against God (6:9–11). At this news, the people turned on Stephen (7:57 Western Text), dragged him outside the city and stoned him (7:58). Stephen underwent the same fate as had, long before, the unfortunate Naboth, possessor of a vineyard coveted by King Ahab. At the instigation of Ahab's wife Jezebel, Naboth was falsely accused before the people of having cursed God and the king. The people then dragged him out of the city and stoned him (1 Kgs 21:11–13). The primitive account of the martyrdom of Stephen is literarily dependent on this narrative of the death of Naboth (Brodie 1983). Beyond the historical facts, its author wanted to signify that Stephen's adversaries were not worth any more than the wicked Jezebel, whose memory had been held in disgrace by all Jews.

C. The Appearance before the Sanhedrin

The primitive account was taken up and amplified, notably with the addition of Stephen's appearance before the Sanhedrin (6:12–15), during which he gave the lengthy address intended to defend himself of the accusations brought against him (7:1–56). It is not at all certain that all these additions were formulated in the same period or that they may be traced back to the same hand. Whatever the case, they were meant to meet two well-determined goals. First of all, they contributed to the establishing of a parallel between the death of Stephen and that of Jesus. Before being put to death, Jesus had appeared before the Sanhedrin and false witnesses had accused him of announcing the destruction of the Temple (Mark 14:55–58; cf. Acts 6:12–14). Secondly, in the presence of his judges Jesus had declared, "You will see the Son of man seated at the right hand of the Power" (Mark 14:62), while Stephen affirmed, "I see the heavens open and the Son of man standing at God's right hand" (Acts 7:56). In both cases, it is these very statements that seem to provoke the fury of the members of the Sanhedrin. Before dying Jesus had prayed God to pardon his executioners (Luke 23:34) as Stephen also would do (Acts 7:60); and, like Stephen later on (Acts 7:59), Jesus entrusted his spirit into God's hands (Luke 23:46). In this, Stephen followed faithfully in the footsteps of his Master (Mark 8:34).

D. A Programmatic Discourse

Above all else, the amplifications in the narrative also made it possible to have Stephen deliver a speech in the presence of the Sanhedrin that laid out some of the governing principles of the Hellenists, ones which, as we pointed out above, extolled Christian openness to the gentiles. This involved a double thematic, already hinted at in the accusations brought against the future martyr: "This man does not cease uttering words against this Holy Place and against the Law" (6:13). By the "Holy Place" one must understand the Jerusalem Temple, which was the center of Jewish religious life, the place of God's presence (1 Kgs 8:10–13). Stephen began by discreetly insinuating, based on notions from the Bible, that God does not dwell in only one place. At the beginning of the Exodus, the Hebrews went forth to worship God in a "place" that was located in the desert (Acts 7:7; cf. Exod 3:12). Similarly, Moses encountered God in the episode of the burning bush in a sacred "place" that was also situated in the desert (Acts 7:33; cf. Exod 3:5). Therefore, there is no unique "Holy Place"; God dwells everywhere (cf. Mal 1:11). Stephen ventured further still; relying on a citation from Isa 66:1–2, he asserted that God does not inhabit dwellings made by human hands (Acts 7:48–50). In this way, the Jerusalem temple was demythologized. Christians were no longer constrained to participate in the worship which took place in the Temple; they could, in this regard, part company with Judaism.

Stephen was also accused of having spoken against the law. He would again quote Scripture to justify his position. After having spoken at length of Moses and his liberating mission, he clearly alluded to that law which the prophet had received from God to transmit to his people (Acts 7:38; cf. Exodus 19). Just before this, however, he had cited the following saying of Moses retrieved from Deut 18:15, 18: "God will raise up from among your brethren a prophet like me" (Acts 7:37). Therefore, Moses, inspired by God, had himself foretold the sending by God of a new prophet who would take up anew and bring to completion his work by giving a new law. When Stephen proclaimed that Jesus was this "prophet like Moses" and the bearer of a new law destined to perfect and replace the Mosaic law, why was there such

an outcry and a charge of blasphemy? Because also on this point Stephen's position marked a break between Christianity and Judaism: the Mosaic law was not absolute; it was destined to give way to the Christian law which had as its purpose the bringing of the Mosaic law to its highest degree of fulfilment (cf. Matt 5:17–48).

In the primitive account, the people bribed by the Jews of the "Synagogue of Freedmen" to calumniate Stephen had accused him of blasphemy against Moses and against God (6:11). In his speech, Stephen answered these accusations, but he did so in much blunter fashion. Instead of showing the well-founded nature of his positions toward the Jerusalem Temple and the Mosaic law, Stephen threw back at his accusers their very own charges against him, all along making references to the Bible. In recalling the episode of the golden calf narrated in Exod 32:1–35, he showed how the Hebrews rebelled a long time ago, and that this rebellion was directed both against Moses, through rejection of his authority, and against God, by the people giving themselves over to idolatrous worship (Acts 7:39–43). Why should the Jews attack Stephen by accusing him of blasphemy against Moses and God, his argument goes, since their own forebears had done worse and they themselves were no better than their fathers (Acts 7:51–53). This apologetic, one must recognize, is much less subtle than that used by Stephen when he justified his positions regarding the Temple and the Mosaic law. Perhaps it was not composed by the same hand as the first and belongs to a later redaction.

Whatever the case might be in this last regard, Stephen's speech before the Sanhedrin constituted a pivotal turning point in the development of Christianity. While the Hebrews—Christians who had come from purely Jewish milieux—would not think of separating themselves from the Judaism whose liturgical and legal customs they intended to preserve (Acts 15:1–5), the Hellenists averred that Christianity, in order to spread among the gentiles, had to break with Judaism by adopting a new liturgy not tied to the Jerusalem Temple and, equally, a new morality based on Christ's teaching. It was this intuition of the Hellenists that Stephen developed in his discourse to the Sanhedrin, in this way showing himself to be the precursor of Paul.

E. Stoning

The Acts narrative gives us no details of the manner in which Stephen was stoned (7:59–60). According to Jewish legislation, one dragged the condemned person outside the city to an elevated place where there was a drop-off spot twice the height of a human person. One of the accusatory witnesses then cast him down from this height in such a way that he would fall on his back. If the person died from this fall, the execution came to an end. But if he did not die from the fall, a second witness dropped a stone onto him, over the heart. If the individual survived these two successive attempts, all the onlookers then had to finish off the job with a volley of stones (cf. Deut 17:7). This is the manner of proceeding according to evidence provided in the Mishnah. Was this how it was done in Stephen's case? We can only conjecture that it was so.

The Acts of the Apostles do not give us any indication either about the place of the stoning. In locating the spot, we have nothing to go on but a tradition that we know about only by way of an occurrence that took place at the beginning of the 5th century, an episode that had powerful repercussions throughout the Church. A priest named Lucien, resident in Caphar Gamala 25 km (= 15 miles) NNW of Jerusalem, claimed to have had a vision on Friday, December 3, 415, in the course of which Gamaliel revealed to him that in his village was to be found a tomb containing the remains of himself (Gamaliel), of his son, Nicodemus, and, above all, those of Stephen, the first martyr. This vision would be repeated on the next two Fridays. Lucien notified the bishop of Jerusalem and an excavation of the grave was begun. Once recovered, the relics of Stephen, whose authenticity no one thought of denying, were transported to Jerusalem on December 26 and set to rest on Mount Sion. Under the guidance of Eudocia, wife of the Emperor Theodosius II and more or less an exile in Jerusalem, and of bishop Juvenal, a basilica was built to house the relics of the first martyr on the presumed site of his death. The building was dedicated on June 15, 460, shortly before the death of Eudocia. Now the remains of this basilica, destroyed in 614 at the time of the Persian invasion, were brought to light when excavations were carried out between 1885 and 1893 by the Dominican Fathers, who had bought the land and on it built the modern-day French

Biblical and Archaeological School (Ecole Biblique). This was situated several hundred meters (yards) to the north of the city's north gate, today's Damascus Gate. Thus did it come about that on this spot Christian tradition located the martyrdom of Stephen at the beginning of the 5th century. What is the value of this tradition? It is impossible to give an answer to this question.

F. Stephen and Paul

According to the author of Acts, Saul, who would later change his name to Paul (Acts 13:9), was present at Stephen's martyrdom and kept watch over the clothing of the accusatory witnesses who initiated the stoning. More to the point, he himself approved this capital punishment (Acts 7:58; 8:1; 22:20). When the author insists in this way on Paul's presence, might this not be to suggest that there is a link between Stephen's martyrdom and Paul's conversion (Acts 9)? He would then have been the first to make his own the idea that later on would be articulated by Tertullian: "The blood of martyrs is the seed of Christians." However, in this instance, the theme actually finds its fullest significance when one recalls that Stephen gave his life to defend the ideal of the Hellenists, according to which Christianity could not develop except by separating from Judaism and by putting distance between itself and the Mosaic law and the Jerusalem Temple. This is the principle which Paul, having become a Christian after he had persecuted the Church, would defend with tenacity (Galatians 1–2). We might say, then, that Stephen was the precursor of the apostle to the gentiles.

STOICS, STOICISM. Stoicism is a modern term referring to the philosophy of the Stoic school. This school took its name from the *stoa poikilē,* a decoratively painted colonnade in Athens, where Zeno began his philosophic lectures and discussions around 301/300 B.C. (for the name, see Hobein 1931:40–47). The school he set up lasted until the second half of the 3d century A.D. Historians like to subdivide it into the periods of the old, middle (from Panaetius onwards), and late (imperial age) Stoa (Colish 1985:7). This is a controversial division, which is not used as the basis for the following overview. Source material is only satisfactory for the Roman imperial period. All earlier Stoics are only documented by quotations and summaries provided by authors of a later period (details in Long 1974:115–17).

B. Important Stoics
C. Relations with the NT

———

A. Stoicism

(Cf. esp. Pohlenz 1984 1.31–158; Colish 1985 1.7–60; Hossenfelder 1985:45–94). The Stoics adopted the basic division of philosophy into logic, physics, and ethics. By comparing logic with the wall of a

garden, physics with the trees, and ethics with the fruits (*SVF* 2. 38) they revealed that their real preoccupation was with ethics.

1. Logic. Of the individual areas of logic—theory of perception, dialectic, and rhetoric—only the first (the most important) will be treated here. The Stoic theory of perception is a sensual one. Things affect the human senses and thereby produce an "image" *(phantasia)* in the soul (which originally resembles an unwritten blackboard). This image is described as a physical "impression in the soul" *(typōsis en psychē)* (like the print of a wax seal) or more generally as "a change in the soul" *(heteroiōsis psychēs)* (*SVF* 2. 56). When the outward stimulation is removed, the images are nevertheless preserved as memories in the soul. Concepts *(ennoiai)* arise by abstracting from that which many memories have in common and by various logical operations, which are based on that (e.g. analogous conclusions) (*SVF* 2. 83, 87). According to the Stoic belief, one cannot achieve reliable knowledge of reality by means of the images alone. Only by means of *synkatathesis,* by the judgment of the *logos* (the human "reason") that an image actually is faithful to reality, can one come to a true perception *(katalēpsis)* or "grasp" of things (*SVF* 1. 59, 60; 2. 65, 97). This is possible because the world to be perceived is itself formed and woven by the universal *logos,* of which the human *logos* is a part, so that the subject and the object of the perception are intimately and ultimately related.

2. Physics. In the Stoic school of thought, being is that which is active or suffering. Since both are associated with physical touch, there can be only a bodily form of being. This materialism of the Stoics, however, introduces (without giving up the claim to a monistic view of the world) a distinction (based on Heraclitus and Aristotle) between *hylē* (matter) and *logos* (reason). "Matter" is the bodily, in so far as it suffers (i.e. is qualified and moved). The active principle which qualifies and moves the bodily is "reason" (*SVF* 1. 85; 2. 299–328). Since these two principles of being, *hyle* and *logos,* can never be separated from one another, the *logos* is given a peculiar, special status: although it never exists other than bodily, it is not a material being.

Matter is fundamentally qualified by the *logos* as warm, cold, moist, or dry. Therefore the simplest bodies are the four elements (fire, air, water, earth). Fire, however, is seen to be the superior element, since the other three are produced by it and dissipate into it again. Therefore the undying fire (which is actively in things in the form of *pneuma,* a warm breath) is equated by some Stoics with the *logos* and with God (*SVF* 1. 157, 160; 2. 423). Cosmogenesis is seen as the emergence of variety from original unity and begins with the thickening of the fire into air and from there into water, when the creative *logos* releases countless *logoi spermatikoi* (seeds of the *logos*), each of which engenders single things and arranges them into the global act of creation (*SVF* 2. 1074). This process reverses itself at a certain point, and with the *ekpyrōsis* (the return of the cosmos into its fiery original state) that world period comes to an end. This process repeats itself *ad infinitum* (*SVF* 1. 107, 109; 2. 596–632).

The world thus represents a uniformly structured physical form, which is imbued with and created by a reasonable power, the *logos.* This creative force is identified with God. The world as a whole is thus like the human being as an individual, a creature endowed with and led by reason (*SVF* 1. 111–4; 2. 633–45). The human body (like the animal) is enlivened with a breathing soul. By contrast with the animal kingdom, the human being also has in his *hēgemonikon* (the major part of the soul) a share of *logos.* At death, the soul separates from the body. It exists for a certain time on its own, but is reabsorbed into the universal *logos* no later than at the next *ekpyrōsis* (*SVF* 2. 809–22).

The divine *logos* is, as shown, both physical and spiritual. It does not stand transcendent outside of the material world, but imbues and deifies it, although in differing degrees of purity. By looking at the beauty and appropriate development of the world, it is possible to develop a natural perception of God. Just as every work of art tells something about the artist, so the greatest work of art, the world, reflects an all-superior creative power (*SVF* 1. 528; 2. 1010–12). Their monotheistic pantheism led the Stoics also to acknowledge the cosmos and parts of it (e.g., the planets) as gods (in the sense of manifestations of the one deity). Even the various divine creatures of popular religions and myths could be integrated into the Stoic theology, for they could be seen as rather blurred forms of reverence for (or pictures of) a particular god, which the Stoics like to call Zeus. They interpreted these myths allegorically. Although the divine

logos is partly described as an artist endowed with reason, the Stoic view of God is not a personalized one. Only a few statements (especially the Zeus hymn and the prayer of Cleanthes, *SVF* 1. 537, 527) move in that direction.

If every development in the cosmos finally comes back to the *logos,* there is nothing that can stand in contradiction to divine work, or be independent of it. As a divinity which does not behave well is unthinkable, the given world is for the Stoics the best possible one: it is created and maintained beautifully and appropriately by the divine providence (*SVF* 1. 172, 548; 1106–67).

Given this view, it is not surprising that questions were raised about the origin of physical and moral evil. The first (illness, death etc.) is explained by reference to the indispensability of antithesis: light cannot be thought of or exist without dark, or good without bad; consequently, the negative pole has to be taken into account as the undesired accompaniment. Moreover, evil things like sickness and death are not seen to be negative at all, given man's independence from the outside world (*SVF* 2. 1168–86). On the other hand, there is an attempt to solve the problem of moral evil by an intellectual interpretation and reference to the human being's freewill; in Socratic tradition, evil is the direct result of a lack of perception, but man is free to attain this perception and to do good (*SVF* 3. 657–70, 682–84).

3. Ethics. The purpose of Stoic ethics is to show man the way to happiness (which is identical to the morally good and the useful). In a negative sense, happiness lies in independence from all outside determinants; positively, it lies in the achievement of all one's own goals. It is important then, to attribute value only to those things which are easily attainable, i.e. to adjust the desired to the possible.

This basic concept was described by Zeno in the formula *homologoumenōs zēn* (*SVF* 1. 179), which actually simply means "living harmoniously". What is probably meant by that is the conformity of desire and possibility and the resulting inner "unanimity," man's equanimity. It is possible that the formula also expresses the leading role of the human *logos* (contained in the word *homologoumenōs*) (Pohlenz 1984:I/116). As early as Cleanthes, the formula was extended to "living harmoniously with nature" (*homologoumenōs tē physei zēn, Stoic.* 3. 12), which constituted a certain change in the interpretation (universal nature as the norm). Later this became "living in accordance with nature" (*kata tēn physin zēn* [*SVF* 3. 16, 17]).

The possibility and the difficulty of such harmonious or natural living is the concern of the Stoic doctrine of passion. Passions *(pathē)* are psychological forms of excitement, which occur when the *logos* agrees to an impulse *(hormē)* elicited by an image *(phantasia),* i.e. when the *logos* falsely judges an external thing to be a worthwhile good or an undesirable evil (like for example wealth or poverty). By means of such a false judgment *(doxa)* the *logos* abdicates its leadership to the passion (*SVF* 1. 205–15; 3. 377–420). However, as the *logos* is free to agree to things (*SVF* 1. 61) and is in a position to make correct judgments (as long as it is not perverted by external influences), freedom from passions and thus happiness are theoretically within reach of man. Freedom from passions *(apatheia)* does not mean total lack of feeling and indifference. But what the wise man feels and desires will remain within the framework set by the *logos:* he will not qualify any of his instinct's desires as a "good."

Freedom from passions is a result of virtue. The essence of this lies in the realization that outside the moral sphere (which only human beings possess) there can be neither a good nor an evil, as happiness can be found only in complete independence from all outside influences (*SVF* 1. 374; 3. 33). In the end though, this realization, virtue, is the only good thing, as it is the necessary and sufficient prerequisite for happiness (*SVF* 1. 188). Since virtue has to do with a perception, it can be taught (*SVF* 3. 233). As virtue not only results in the achievement of all man's aims, but also represents the only true aim, it is theoretically identical with happiness. That is why it is worthy of achieving for its own sake (*SVF* 3. 38–48).

There are no single virtues in the sense that one could possess one and not the other: "to have one is to have them all" (*SVF* 3. 295). The four traditional cardinal virtues are insight *(phronēsis),* prudence *(sōphrosynē),* courage *(andreia),* and justice *(dikaiosynē);* according to Zeno, the latter three are nothing more than manifestations of the first, which as "virtue" in the real sense of the word represents insight into the real relationship of values and makes itself known by way of prudent choice, courageous

endurance, and just sharing (*Stoic.* 1. 200–1). "Of all existing things, one kind is good, the other evil, the third indifferent *(adiaphora)*" (*SVF* 1. 190). The *adiaphora* are: "death, life, fame, scandal, hardship, lust, wealth, poverty, sickness, health and the like" (ibid.). Although these things do not have any bearing on the happiness of man, and although he must preserve his independence from them, there is nevertheless a distinction between indifferent things which are "preferred" *(proēgmena)* and those which are "rejected" *(apoproēgmena).* The former are those which are outwardly beneficial to human life (like health, wealth, and intelligence); the latter are the opposite. Between them there is another group of things which are indeed completely indifferent, like the stretching or bending of a finger (*SVF* 3. 188, 122). The acceptance of preferred things which have a certain value (if not for the attainment of actual happiness) and are worth striving for (if not as real goods), is not a weakening, but a consequence of the doctrine of passion (Hossenfelder 1985:59–60):In order to avoid giving something inappropriate the character of a good or an evil, and without making a judgment of its own, reason aligns itself with the animalistic, self-preserving endeavors of the instinct.

The behavior of the wise man in everyday life is thus aligned "instinctively" to the natural. That is why his actions will in most cases be indistinguishable from a quite normal way of life, since even the unwise tend to follow the self-preserving aims of their instinct (but misunderstand these aims as signs of "goods" or "evils"). Natural behavior is called *to kathēkon,* "the appropriate, befitting," regardless of this difference in interpretation—e.g., "to honor parents, brothers and sisters and homeland, to nurture friendships" (*SVF* 3. 495). Appropriate actions *(kathēkonta)* which are carried out with the attitude of the wise (i.e. conscious of their indifference) are labelled *katorthōmata* (actually "justly done").

The extensive regulation of practical behavior by instinct seems to imply completely egoistical and individualistic action. Stoic ethics, however, point out that the natural basic instinct for self-preservation also includes caring for one's neighbors: the common nature of reason allows man to recognize himself in others, so that he actually looks after himself whenever he acts for the benefit of others. In according with that, social behavior is quite natural (*SVF* 3. 611–36). The Stoic sees himself as part of a cosmopolis of man and gods, which combines their logos, and in which only the condition of the *logos,* and not origin, sex, rank etc. determines the higher or lower position (*SVF* 3. 349–66).

B. Important Stoics

Zeno of Citium (333/2–262/1 B.C.), the founder of the Stoa, went to Athens in 312/311, studied under the Cynic Crates but also under Academics and Megarians, until he began to teach himself in 301/300. His impressive system correspond to the feeling for life of Hellenism, in so far as it tries to present a secure path to happiness (independence of outside circumstances) to those suffering from the general sense of insecurity precipitated by the dissolution of the polis and the concommitant political changes.

Zeno's successor as head of the school was Cleanthes (about 331/330–232/231 B.C.), who had studied with him from 282/281. He retained the doctrine of Zeno without displaying great originality of his own. However, he did add a new religious element to it, when he worshipped the universal *logos* in his hymn to Zeus (*SVF* 1. 537).

The signs of the school's decline, noticeable under Cleanthes were not stopped until the next head, Chrysippus (about 281/277–208/204 B.C.) took over the school. The saying "Without Chrysippus there would be no Stoa" (*SVF* 2. 6) rightly emphasizes his contribution towards the consolidation of the school, which he achieved by logically systemizing the teachings. Characteristic of him is his intellectualism: instinct is no longer separated from reason and subject to its judgment, but is in fact the very value judgment itself (i.e., a property of reason), so that a passion consists of a false judgment of reason.

Panaetius of Rhodes (about 185–98 B.C.), who along with Posidonius of Apamea is often considered to be the main representative of a "middle Stoa" (Colish 1985:10) was head of the school from about 129. Above all, his affiliation with the circle of Scipio Africanus Minor meant that he was a great influence on the intellectual life of Rome. Panaetius moderated the Stoic rigor both in relation to other philosophical schools and in daily life. For example, he no longer saw virtue as the only good on which happiness relies: what the older Stoics classed as natural, "preferred" *adiaphora* (like wealth, health) were given by him the character of goods of the second order, which can lead the way to virtue. He considered the

passions as unavoidable and taught the right way to cope with them. According to Panaetius, Providence has over time stabilized the world. It has made man capable (by means of his own *logos*) of creation and self determination. Destiny *(heimarmenē)* is left with, at most, theoretical significance.

Posidonius of Apamea (about 135–50 B.C.) studied under Panaetius in Athens, but then opened his own school on Rhodes, where Cicero became his student. As there is very little witness to his teaching, a reconstruction can only be made with great difficulty. Characteristic of his philosophizing is the inclusion of a whole range of concepts from other disciplines like history, mathematics, geography, astronomy etc., all of which he combined in his *logos* philosophy to a systematic world view. Just as man is inspired by the divine universal spirit, because his soul comes from it, so are all things, particularly animals and plants, imbued with God and kept alive. The cosmos is a living creature, with a great variety of interrelationship between individual parts.

The Stoics of the Roman Empire period fell back on the founders of the school, without developing any great originality themselves. However they were not concerned with Stoic orthodoxy: they tended toward eclecticism. Other typical factors are the diminishing emphasis upon logic and physics, the increasing religious element, and the attempt to find practical moral relevance for philosophizing.

The concrete definition of Stoicism's ethical dogmas (e.g., their use in fighting individual passions like anger) and its popularization (by means of an effective style) must be credited to the Nero teacher, politician, and poet, L. Annaeus Seneca (4 B.C.?–A.D. 65). Important to Seneca is the dependence of the morality of an action on the inner attitude of its bearer: a deed can only be good if its intention is. Conscience is the last moral norm. "I will do nothing for a (good) reputation, everything for a (good) conscience" (*vita Beata* 20. 4). This final arbiter is given to man by God, who in Seneca's writings sometimes seems to have personal characteristics.

The practical element of philosophy is even more obvious in C. Musonius Rufus (about A.D. 30–100), who, occasionally in exile on Gyarus, held lectures on life for an educated lay audience. He used traditional Stoic principles to find answers to questions like: should daughters be educated the same as sons (of which he was in favor), or what is the most important thing in marriage? The purpose of the lessons was not simply to know and understand philosophy but more importantly to be able to apply it.

More significant is Epictetus (about A.D. 50/60–120/40), who studied under Musonius and, like his teacher, directed a school of philosophy for lay people first in Rome, and, after the banning of the Roman philosophers by Domitian (A.D. 89), in Nicopolis. The *diatribal* recorded by Arrian and the famous *encheiridion,* a collection by Arrian of the central points of Epictetus' teaching, show that his lecturing amounted to a lively, pastoral counseling based on old Stoic principles (with a touch of the Cynic). The positive value of the "preferred" *adiaphora* was something he definitely rejected: existence is strictly divided into what is "up to us" and what is "not up to us" (*ta eph' hēmin–ta ouk eph' hēmin*); happiness is only attainable by the conscious restriction of our ambition for *ta eph' hēmin,* i.e. for the inner, evaluating but distance attitude to external things. Central to Epictetus' ethics is the affinity of man to God (whom he portrays even more personal than Seneca) and the divine Providence. See EPICTETUS.

C. Relations with the NT

It would be beyond the scope of this article to deal comprehensively with the complex problem of to which extent, by which ways, and under which changes Stoic thoughts and forms of expression have left their marks in the NT. Only some NT texts, which are especially relevant, will be considered.

In Acts 17:22–31 Greco-Roman conceptions and the worship of God are criticized in a way we find in Stoic authors as well: Thus the ideas that God should live in temples made by hand (v 24b) or that "the divine" should equal a picture made by men (v 29) are rejected. Cultic sacrifice is criticized with the argument that God has no needs (v 25a). The positive statement about the closeness of God to each human being (v 27) corresponds with the Stoic conception of God; in v 28a this statement is expressed in a triadic formula which probably is a borrowed Stoic phrase.

As we have seen, the Stoics can perceive God by regarding the harmony and beauty of the cosmos. Paul holds a similar "natural theology" in Rom 1:19–20: Although God is invisible, he can be seen in his creational works by reason. Nevertheless, in this statement Paul is not directly dependent on the Stoics,

but on wisdom and apocalyptic tradition. Like the latter, he does not pretend to explain the possibility of the rational knowledge of God. Instead, his aim is the proclamation of God's judgment of the gentiles, who did not make use of this possibility.

The Stoic ethics in particular became important for the NT. In 1 Cor 7:29–31 Paul advises a distant attitude toward the world, which at least has certain similarities to the Stoic ideal of being imperturbable *(ataraxia).* The clearest difference between Paul and this ideal is the eschatological reason for this attitude, which can be seen in 1 Cor 7:29a, 31b and which has no parallels in Stoicism.

When Paul, in Rom 2:14–15, writes that gentiles "do by nature *(physei)* what is in accordance with the law *(ta tou nomou),*" because "the work of the law is written in their heart," he is using a topos of Hellenistic ethics (which he probably knows from the Hellenistic-Jewish apologetics). Especially Stoicism emphasizes life in accordance with nature *(physis)* as a moral aim. The law of nature, an unwritten law, which is perceived by reason, is of greater obligation than every law *(nomos)* made by human beings.

In the NT letters parenetic genres can be found, which have at least some of the roots of their form and concrete filling in the Stoic popular philosophy: catalogues of vices (Rom 1:29–31; 13:13; 1 Cor 5:10–11; 6:9–10; 2 Cor 12:20; Gal 5:19–21; Eph 4:31 5:3–5; Col 3:5,8), of virtues (Gal 5:22–23; Phil 4:8; Col 3:12; 1 Tim 6:11; 2 Pet 1:5–7), and of duties of each member of a household (*"Haustafeln":*Eph 5:22–6:9; Col 3:18–4:1; 1 Pet 2:18–3:7). Such catalogues show a great correspondence with moral convention of the NT environment, especially with that of Stoicism. One can often hear that in Stoicism ethics is a function of the intellect, whereas in the NT it is a function of the existential determination of the Christian by Christ. That is true to a certain extent. But this difference is hardly to be perceived where on the one hand the Stoic ethics really becomes popular and includes a strong religious element and where on the other hand NT ethics begins to be oriented by the conventional common sense. Therefore, the problem of the *proprium* of the NT ethics is particularly pressing in view of the means of the moral instruction just mentioned.

In some sections the letters of Paul show stylistic analogies to the *"diatribe,*" a form of popular-philosophic propaganda in antiquity which was especially used by Stoics. Part of this style form the catalogues of vices and virtues already dealt with, but also catalogues of sufferings, the so-called *"Peristasenkataloge*" (esp. 1 Cor 4:10–13; 2 Cor 4:8–12; 6:4–10; 11:23–29; 12:10). The section which is nearest to the style of the *"diatribe*" (rhetoric form, vivid expression, low density of thought, and dialogue elements) is 1 Cor 15:29–49 (cf. also Rom 1:18–2:11; 8:31–39; 11:1–24; 1 Cor 4:6–15; 9:1–18). Paul uses this stylistic device particularly in order to make a personal appropriation of difficult theological trains of thought easier for his readers.

STRUCTURALISM. A philosophical theory about the way in which meaning is perceived through the structures of human cultural systems. It has been applied in various ways to almost all the sciences and the humanities; in every case it attempts to show that meaning and significance result from the way human beings shape and pattern their intellectual systems, rather than being inherent in the subject matter being studied.

A. Structuralism in General

1. Structuralism in Linguistics. The foundation of structuralist theories lies in *linguistics,* and is associated especially with the work of Ferdinand de Saussure (1857–1913) (see Saussure 1974). Whereas linguists had traditionally looked to the history of language to explain its meaning, Saussure argued that meaning was a function of the interlocking relationships within the linguistic system of any given language at a particular moment. Thus, if we want to know the meaning of a word, we should not primarily ask about its history or etymology, but should look at all the words with which it contrasts in the language as at present constituted. Take words for color, for example: the meaning of the English word "red" for a modern speaker has little to do with the etymology of the word or its use in earlier stages of the English language (of which the ordinary speaker is quite unaware); it has much to do with the other words for this range of colors that were available to the speaker, and from which the speaker selected "red" rather than "scarlet," "crimson," etc. The English words for color form a self-contained system which divides up the spectrum conventionally in certain ways, and unless we are in command of the whole system, we cannot understand what is conveyed by each individual color term.

The idea of language as a structured system which provides as it were the resource from which individual utterances can be drawn, and the basis for understanding their meaning, is central to structuralist linguistics, and is widely accepted by modern linguists. The linguistic system is called by Saussure the *langue,* as opposed to the *parole,* which is the individual linguistic utterance (Saussure 1974:7–17). Two other important terms are *synchronic* and *diachronic.* Synchronic study of language is the study of the system or structure of a language as it exists at a given moment, whereas diachronic study refers to the traditional concern for the history of a language.

2. Structuralism in the Study of Human Culture. The structuralist movement in modern philosophy and aesthetics represents an attempt to apply the insights of structuralist linguistics by analogy to other aspects of human culture. In anthropology, Claude Lévi-Strauss (1963) applied de Saussure's ideas to the description and analysis of myths in pre-philosophical societies. Drawing on the distinctive relation of *parole* (speech) to *langue* (system), Lévi-Strauss argued that individual myths (cf. *parole*) are related to an underlying structured system of stories (cf. *langue*) which provide a basic account of reality for peoples who have not yet developed an abstract conceptuality. Each myth makes sense only when one has reconstructed the entire system of myths of which the individual myths form a part; a particular myth's meaning is then a function of its contrast with other myths.

Roland Barthes (1976) and Umberto Eco (1976) proceeded to apply the same ideas to modern societies, arguing that here, too, the meaning of cultural forms is a function of their synchronic relation to a structured system of meaningful signs. The term *semiotics* (from Gk *semeion,* sign) was coined to describe this kind of study, which has been important also for modern sociology. Chess is a good example

of a human cultural system which is susceptible of semiotic or structural analysis. In chess, the "meaning" of the moves is determined conventionally by the relations between the pieces and by the rules of the game, and is a function of contrasts between the pieces and the moves they are allowed to make. A "rook" exists only within this system, as the piece which can move more flexibly than a pawn, for example, but less flexibly than a queen, as one of a pair of pieces which can guard the king and so on. Once removed from the chessboard, the rook is a rook no longer, but simply a piece of wood. It has no meaning except within the game. Until one is in command of (or, in technical structuralist terminology, is *competent* in) the rules of chess as a whole, one cannot understand an individual piece or make any sense of a particular move. Almost all social and cultural situations are similarly susceptible of structuralist analysis, from law courts and public meetings to meals and parties.

3. Structuralism and Literary Study. But it is above all in the study of *literature* that structuralism has proved influential. At first in France, but later in the English-speaking world as well, literary critics sought to apply the linguistic model of synchronic, structural interpretation to literature and to interpret literary works as part of a structured system analogous to a language. In the work of Roland Barthes (1976) and A. Greimas (1966) and their followers, the conventions with which literary forms such as novels, lyric poems, and drama operate are explained as a kind of *langue*—so that individual works should be understood less as the inventions of creative writers than as illustrations of the possibilities inherent in the "system" of literature. Just as one may become "competent" in a particular language by internalizing its conventions and rules, so, it is suggested, one may become competent in a given literature by coming to understand the conventions and constraints under which it operates. The early successes of structuralist analysis were in the interpretation of such traditional forms as folktale (see especially Propp 1968) and (in modern literature) detective novels, where any reader can see that quite strict conventions operate, but structuralists have also sought to show that all literature without exception is rule-bound. Often there is a certain iconoclastic intention here—to convince the reader that what most people think of as works of individual genius are in reality no more than expressions of literary conventions: "originality" is an illusion. In this, structuralism joins hands with more recent schools of interpretation such as materialistic, sociological, and psychoanalytic criticism, all areas in which works traditionally seen as highly original or innovative are explained more or less deterministically as the result of forces beyond their authors' control, and so somewhat debunked.

B. Structuralism and the Bible

1. Language. Many of the basic ideas of Saussurian structuralism are widely accepted by linguists, and they have naturally affected the study of Biblical Hebrew. James Barr's *The Semantics of Biblical Language* (1961) represents a turning point in the linguistic study of the Bible. Against the etymologizing, diachronic approach to Hebrew and New Testament Greek which found expression in the *TDNT* Barr argued that the biblical languages should be studied in accordance with current practice in general linguistics: meaning must be determined by the present context of words and sentences in the biblical text, and must not be read off from the (supposed) derivations of "key words." Barr also argued against the idea that a special "Hebrew mentality" could be deduced from features of the language, such as its verb system or its syntax, showing that this was incompatible with a structural approach to language. Since Barr, the study of biblical languages has moved more closely into line with Saussurian categories, and the *TDNT* has fallen out of favor with many scholars.

2. Anthropology. Structural anthropology has made important contributions to understanding some of the categories of thought that lie behind the OT text. An interest in structured systems has, since Lévi-Strauss, led anthropologists to examine *kinship structures*—the patterns of permitted and forbidden degrees of marriage through which, it is suggested, societies maintain their equilibrium and understand their own meaning. E. Leach (1970) has analyzed biblical genealogies from this point of view, seeing in them (especially in the Table of Nations of Genesis 10) the Israelite understanding of the place of Israel in the wider world. It has also been argued by Douglas (1966) that the complex food laws of Leviticus 11 and Deuteronomy 14 can be understood from a structural perspective as the remains of a classification system, by which ancient Israel introduced significant distinctions into its perception of the animal world

and so marked off an area of cultic safety within which to live a harmonious existence. So far, however, these applications of structuralist theory to the Bible have been occasional and unsystematic, and it remains to be seen whether biblical studies will move further in this direction.

3. Literary Structuralism. The major influence of structuralism on biblical studies has been in the area of exegesis and literary analysis. The initial impetus for a structuralist study of the Bible came not from biblical scholars themselves, but from within the French structuralist movement. A pioneering study is that of Roland Barthes on the story of Jacob and the angel in Gen 32:22–32 (see Barthes 1974). Using the analytical categories of Greimas (1966), Barthes interprets this story as a folktale in which a new twist has been given to the plot by exploiting some of the conventions with which folktales normally operate. The participants in the story can be formally defined by their functions: God is the "originator," Jacob is the "hero," the angel is his "opponent." In the "syntax" of folktale proper, these three "actants" (as they are called in Greimas' terminology) may interact in various ways: the "originator" may step in to help the "hero"; or one or more "helpers" may be introduced into the plot; or the "hero" may succeed in his quest by his own efforts, but at the end be rewarded by the "originator." But in the story in Genesis none of these patterns is followed. Instead, as Barthes shows, the "originator" and the "opponent" turn out to be one and the same—it is the very God who sent him on his journey with whom Jacob wrestles all night, and who in the end blesses him for his persistence in resisting him.

A structural analysis thus reveals that Genesis 32 is an *artificial* folktale, whose effectiveness depends entirely on its success in "subverting" the normal rules of folktale to produce a surprising outcome which shocks and disturbs the reader. In Barthes' study, this structuralist reading is shown to be theologically significant. The idea that one and the same God stands behind *all* that happens to his servants is a central theme of much OT narrative, which avoids dualistic explanations of history and attributes both good and bad experiences alike to the providential guidance of a single God; as Joseph says to his brothers, "As for you, you meant evil against me; but God meant it for good, to bring it about that many people should be kept alive" (Gen 50:20). Thus a structuralist analysis can help to show by what methods the biblical writers convey their message, pointing to the exploitation of structural possibilities.

In Barthes' analysis of Genesis 32 there is, strictly speaking, no new *interpretation* of the text: the theological point which the text is said to make is familiar to readers of the Bible in any case. The analysis simply lays bare the mechanisms by which the text succeeds in conveying the meaning that most readers would find in it. Thus structural analysis here provides an explanatory theory, rather than generating a new exegesis. But since Barthes many biblical scholars have seen in structuralism a tool for discovering new meanings in the biblical text. As in some advanced forms of redaction criticism, the arrangement of elements within the text is thus taken as highly significant, and much attention is devoted to the shaping of texts through repetitions, chiastic arrangement, and stereotyped formulas, as well as by contrasting pairs ("binary opposition"). Thus, in an early structuralist study of Genesis 1–2, P. Beauchamp argued that 1:1–2:1 is so constructed that the ten "words of creation" ("and God said …") fall into two balancing groups of almost exactly equal length. The "meaning" of the passage is then the tension or contrast between the two groups, in which the inanimate created order is contrasted with the world of living beings, and the final act of each set of five "words" is meant to be set over against that of the other: the stars (the crowning work of the fourth day) are set over against man (the last creature made on the sixth day), and the reader is supposed to see an important truth in this contrast.

A major theme of structuralist approaches to biblical study has been a desire to undermine the results of conventional "historical" criticism. Many structuralist studies claim that structural analysis reveals patterning and order in texts which biblical critics had previously seen as fragmentary or confused. Just as structural anthropologists often claim to find a coherent system of thought underlying what strikes the uninitiated observer as a tangle of inconsistent myths or folklore, so structural exegesis sees apparent confusion in a text as a clue to a deeper, underlying pattern. At times conservative biblical scholars have made common cause with structuralists (as also with CANONICAL CRITICISM) because it seemed to offer a way of defending the integrity of the present form of the biblical text. This is, however, by no means universally true, and many structuralists have no interest in defending traditional doctrines of

biblical inspiration. They may be attracted to structuralist analysis of the Bible because the biblical texts, being often anonymous, traditional, and complex, seem to demand an explanation that does not emphasize the deliberate intentions of an individual author but rather the operation of subconscious patterns buried in the human psyche.

C. Post-Structuralism

Structuralism has proved a highly changing and developing movement, and since the late 1960s many fresh developments have appeared that may be grouped together under the heading "post-structuralism." See also POST-STRUCTURAL ANALYSIS. *Deconstructionism* is an attempt to undermine the reader's expectations that a text will communicate some independently existing truth, by showing that author and reader alike are caught in the system of constraints imposed by the linguistic and literary system to which they belong, and are capable of communicating or receiving only such meanings as this system makes possible (see Culler 1981). In *reader-response criticism* (see Iser 1978; Jauss 1982) the idea that a text has a fixed meaning is abandoned, and the reader is seen as having a vital role to play in contributing to the meaning of a work. Reading is as "creative" an activity as writing. This has been of particular interest to students of the parables in the gospels (see Via 1985; Patte 1976), which seem inherently to call for a response from the reader if they are to be effective. It may be said that a parable means nothing until it meets with a responsive reader: the attempt to state the meaning of the parables in a "timeless" form notoriously tends to reduce them to platitudes. See also READER RESPONSE THEORY.

JOHN BARTON

SUAH (PERSON) [Heb *šaḥ* (שַׁח)]. The first son of Zophah given in the Asherite genealogy in 1 Chr 7:36. This figure appears within the dominant line of the genealogy (Beriah, Heber, Hotham/Helem, Zophah), and yet nothing is known about him. He is attributed with no descendants, and his name does not appear elsewhere in the Hebrew Bible. While some scholars consider such unique names as fabrications of the Chronicler, Johnson and others suggest that they derive from military census lists, themselves drawn up in genealogical fashion (Johnson 1969:64–66).

JULIA M. O'BRIEN

SUBAS (PERSON) [Gk *Soubas* (Σουβας)]. Forefather of a family included under the heading the "Sons of Solomon's Servants," which returned with Zerubbabel (1 Esdr 5:34). However, this family is not included in the parallel lists in Ezra 2 and Nehemiah 7.

CRAIG D. BOWMAN

SUCATHITES [Heb *śûkātîm* (שׂוּכָתִים)]. One of three families who lived in the town of Jabez and who, while tracing their descent through Caleb, counted Kenites in their ancestry (1 Chr 2:55). These families either comprised secretaries *(sōpĕrîm),* belonging to a scribal guild, or were Siphrites *(siprîm),* earlier dwellers of Kiriath-sepher (Braun *1 Chronicles* WBC, 38, 43). The Jabez at which they settled is unknown. (A Jabez is introduced abruptly in 4:9–10 with etymological explanation but without lineage.) At least as early as Jerome some have understood the Sucathites, Shimeathites, and Tirathites to refer to groups of religious functionaries, yet nothing substantial exists upon which to base such a view. Williamson (*1 and 2 Chronicles* NCBC, 55) notes the attempt to derive the word Hammath from a proposed noun **ḥēmāt,* meaning "family-in-law"—which would make the three Kenite clans descendants from a relative by marriage of the Rechabites' forefather. He observes, however, that in the context of this list one would expect a place name after "the father of" and compares *byt-rkb* with *byt mrkbwt* (4:31; Josh 19:5). The genealogy of 1 Chr 2:55 seems to reflect the ongoing amalgamation of previously unrelated tribal elements into the mainstream of Judah.

EDWIN C. HOSTETTER

SUCCESSION NARRATIVE. See COURT NARRATIVE.

SUCCOTH (PLACE) [Heb *sukkôt* (סֻכּוֹת)]. The name of two places mentioned in the OT.

1. The first station of the Exodus located in the NE delta of Egypt (Exod 12:37; Num 33:5). The Israelites left Rameses and pitched in Succoth and then journeyed to Etham where they camped on the "edge of the wilderness" (Exod 13:20, Num 33:6). The location of Succoth is connected with the identification of the sites of Rameses and Pithom which have not been positively determined. See also RED SEA. Tell el-Maskhuta located 15 km W of modern Ismailia and Lake Timsah in Wadi Tumilat has been suggested by a number of scholars as a possible location of Succoth. The name Succoth may be an adaptation of Egyptian Tjeku *(tkw),* a region and perhaps a city proposed to be located at Tell el-Maskhuta. Brugsch has offered an explanation of the derivation of Hebrew Succoth from Egyptian Tjeku *(tkw)* correlating Egyptian *t* with Hebrew *s,* Egyptian *k* with Hebrew *k,* and noting that the Egyptian *w* is a plural suffix while the Hebrew *wt* represents the feminine plural suffix (Bleiberg 1983:21). Papyrus Anastasi V records that an Egyptian lieutenant traveled from the palace (supposedly at Rameses) to Tjeku in one day (*ANET,* 259) fitting nicely with the biblical narrative, although Gardiner (1920:109) disputes this supposition and Bleiberg, an excavator on the Wadi Tumilat Project, finds it difficult to locate the places mentioned in the text (1983:24–25).

Numerous monuments with the name of Tjeku have been excavated at Tell el-Maskhuta, and they also contain references to the temple of Atum or Pr-ꜥitm, possibly corresponding to the Hebrew Pithom. Naville, who excavated there in 1883, identified Tell el-Maskhuta as Pithom, the treasure city built by Hebrew slaves (Exod 1:11) noting particular architectural features he considered to be store chambers. Most scholars now identify the site as Succoth observing the structures to be from the Roman period and earlier structures to be part of the fortress foundations known to have been at Egyptian border towns. For a review of Naville's arguments and Gardiner's rebuttals, see Bleiberg 1983. A possible compromise would have Succoth or Tjeku as the name of the district and Pithom referring to the religious center at Tell el-Maskhuta. Papyrus Anastasi VI dating to about 1230 B.C.E. preserves a message sent from a frontier official to his superior that certain Edomite bedouin had been allowed to pass the fortress in the

district of Tjeku (Succoth?) to pasture their cattle near Pithom (*ANET*, 259), locating both places in the same area. Bleiberg (1983) suggests that Tjeku was originally a region and then later a city located at Tell el-Maskhuta. Pr-ʾitm, he believes, only refers to the temple of Atum, and he states that there is no clear evidence to locate a city of Pithom there.

2. A city located on the E of the Jordan River close to where it is joined by the Jabbok (Nahr Zerqa). Jacob stopped here when returning from Padan-aram and built a house and "booths" for his cattle, hence the name Succoth, "booths" (Gen 33:17). It was located in the kingdom of Sihon and allotted to the tribe of Gad (Josh 13:27). Gideon stopped here while pursuing the Midianites and asked for provisions for his army from the men of Succoth and also Penuel. He was refused in both cases, and upon his victorious return he inflicted punishment on Succoth and beat down the tower of Penuel (Judg 8:5–17). It was also between Succoth and Zarethan on the plain of the Jordan that bronze vessels were cast for the Temple under the direction of Solomon (1 Kgs 7:46; 2 Chr 4:17). The Valley of Succoth is mentioned in the Psalms (60:6; 108:7) with a positive connotation which would fit the location in the fertile region at the junction of the two rivers known as the Ghor Abu Obeideh.

Tell Deir ʿAlla has been suggested as the location of Succoth by many scholars. The stele of Shishak at Karnak mention six sites in the Valley of Succoth: Adam, Qodesh, Penuel, Succoth, Mahanaim, and Zaphon. Mazar (1957) has proposed a reading which fits nicely with the location of Deir ʿAlla according to the order they are listed. Tell Deir ʿAlla was occupied during Chalcolithic, Late Bronze, and Iron Ages I–II, and used as a cemetery by the residents of nearby Abu Gurdan until approximately 1500 C.E. The LB level contains remains of a sanctuary complex raised on an artificial mound and no defensive walls typical of the period. It has been suggested that it served as a shrine for the nomadic population of the region. It was destroyed early in the 12th century B.C.E. by uncertain means, although there is evidence of a conflagration and an earthquake has been suggested (Franken 1979). Aharoni (*LBHG*, 284 n. 224) is willing to allow that this was the result of Gideon's vengeance. An Egyptian vase bearing the cartouche of the wife of Seti II, Taousert (1214–1194 B.C.E.), was discovered at this level as well as three clay tablets whose script is related to Phoenician.

The Iron I remains also show no permanent settlement, only remnants of furnaces for smelting bronze and some postholes perhaps for tents of the metal workers. Aharoni here relates this to the smiths casting vessels for the Solomonic Temple. The Iron II settlement is a walled city in which the famous Aramaic inscription fragments mentioning the prophet Balaam were found. See also DEIR ʿALLA.

Franken, who has excavated at Deir ʿAlla, does not identify it as biblical Succoth (Franken 1979). He follows Abel in preferring Tell el-Ekhsas, 2.5 km to the west (*GP* 2:470). The name of this tell translates from Arabic to "booths." Franken contends that the cultural assemblage from Iron Age Deir ʿAlla is not Israelite and therefore it is not Succoth. The pottery seems to indicate Ammonite influence or origin. He also cites the absence of any biblical references to shrine at Succoth, and there is a very substantial one from the Late Bronze/Early Iron Age at Tell Deir ʿAlla.

Levine (1985) presents a number of arguments in opposition to Franken's conclusion. He suggests that the Deir ʿAlla texts originate from a context of continuous cultural interaction from both sides of the Jordan which could easily represent an Israelite presence. He bases his stance on linguistic and literary analyses proposing the language of the texts as a regional dialect related more closely to the surrounding Canaanite group rather than to the old Aramaic. He also contends the shrine may be an ʾEl temple easily fitting within the scope of Israelite culture if not Israelite monotheism.

JO ANN H. SEELY

SUCCOTH-BENOTH (DEITY) [Heb *sukkôt bĕnôt* (סֻכּוֹת בְּנוֹת)]. A deity whose worship was instituted by the Babylonians who had been forcibly resettled in Samaria (2 Kgs 17:30). Although Samaria had been destroyed in 722 B.C., it was not until 689 B.C. that the Assyrians captured Babylon and dispersed its people. Because the name is perfectly intelligible in Hebrew ("booths of girls/daughters"), and because no Babylonian deity by this name is known, the identification of Succoth-benoth is problematic. The MT seems to contain an oblique reference to shrines *(sukkôt)* associated with sexual rites involving women *(bĕnôt),* perhaps women dedicated (Akk *sakku*) to the Babylonian Banitu (i.e., Ishtar) or Ṣarpanitu (consort of Marduk; see Wiseman, *ISBE* 4:649). The possible association with one of these Babylonian goddesses is reinforced by some of the LXX renderings of the name which include a final vowel *(Sokchōbenithei, Sokchōbanitha).* Some have suggested that while *bĕnôt* may indeed reflect one of these Babylonian deities, *sukkôt* may be identified with the Sumerian deity SAG.KUD (i.e., Saturn), whose name in Akkadian was actually vocalized *sakkud* (Hallo 1977:15); this deity may be the same "Sakkuth" (Heb *sikkût*) mentioned in Amos 5:26. See SAKKUTH AND KAIWAN. The suggestion that the MT is actually a corruption of an original **mrdk wzrbnyt* ("Marduk and Ṣarpanitu") has recently been questioned (Cogan and Tadmor, *2 Kings* AB, 211).

GARY A. HERION

SUD (PLACE) [Gk *Soud* (Σουδ)]. The name of the river in Babylon along which Judean exiles, including King Jeconiah (Jehoiachin), were settled (Bar 1:4). These exiles were the original audience to whom the book of Baruch was directed. The name Sud is problematic, and the Gk form may reflect a distortion of the uncial script spelling of Ahava (LXX *eoua*), the name of the river where the exiles were gathered on the eve of their return to Jerusalem (Ezra 8:15, 21, 31; see Moore, *Additions to Daniel, Esther, Jeremiah* AB, 270).

GARY A. HERION

SUDIAS (PERSON) [Gk *Soudios* (Σουδιος)]. In 1 Esdr 5:26, this name is possibly an alternate form of HODAVIAH #4.

SUETONIUS (PERSON). Gaius Suetonius Tranquillus, Roman biographer and antiquarian, was born ca. 70 C.E., possibly at Hippo Regius in North Africa. His family held equestrian rank, his father serving as a tribune of the Thirteenth Legion. Suetonius began his career as a professional scholar in Rome, working as a teacher of rhetoric and as an advocate. He was a friend of Pliny the Younger, whom he accompanied to Bithynia ca. 110 C.E. and with whom he later corresponded. Subsequently, Suetonius held several imperial offices. His duties as secretary of studies *(a studiis)* are unclear. He served next as director of the imperial libraries. He likely held both these posts under Trajan (98–117 C.E.. Under Hadrian (117–38 C.E.) he held his most important post, secretary in charge of imperial correspondence *(ab epistulis).* In 122 C.E. he was dismissed from this post, apparently for disrespectful behavior toward the Empress Sabrina. The date of his death is unknown.

Suetonius wrote treatises on Roman antiquities, on the natural sciences, and on grammar. Of these works, only excerpts from his treatises on Greek games and on curses remain. Suetonius also wrote two collections of literary biographies. *The Lives of Illustrious Men,* written during the reign of Trajan, contained brief biographical sketches of 21 grammarians, 16 orators, 33 poets, and 6 historians. Substantial fragments of this work are extant. During the reign of Hadrian, Suetonius published his *Lives of the Caesars,* which contained biographical sketches of the emperors from Julius to Domitian. All this work, except for the first chapters of Julius' life, has been preserved. In his imperial biographies, Suetonius was interested in both the private lives and the public activity, especially the day-to-day public activity, of the emperors.

In his *Lives of the Caesars,* Suetonius provides insight into Roman religious practice and thought in the early empire. Suetonius firmly believed that the workings of fate were determined and could be foreseen.

He devoted much attention to the omens and signs that attended the births and deaths of the various emperors. Suetonius also firmly believed that the emperors had a duty to live and act so as to protect and sustain the traditional pattern of Roman life (Wallace-Hadrill 1983:128). Religious practice was an important part of that life. Emperors who failed to honor the gods properly (*Tib.* 69, *Ner.* 56) were censured by Suetonius. Actions taken by emperors to return religious practice to the traditional pattern, such as the purging of the Sibylline oracles (*Aug.* 31.1), the disciplining of the Vestal virgins (*Dom.* 8.3–4), and the reviving of old rituals (*Aug.*31.3–4, *Claud.* 22) won his approval. Emperors were called upon to resist innovation in religious practice, even innovation which served state interests. Suetonius noted with approval that the establishment of emperor worship in Rome was resisted by Augustus (*Aug.* 52), while Caligula's insistence that he be treated as a god was seen as a vice (*Calig.* 22.2–4). Emperors were expected to oppose even more vigorously innovations that did not serve state interests. Suetonius observed that Augustus correctly honored all ancient and long-established foreign rites, but despised all the rest. Egyptian worship of Apis and Jewish worship in Jerusalem were singled out for disapproval (*Aug.* 93). Tiberius was commended for abolishing foreign cults at Rome, especially the "superstitious" Egyptian and Jewish cults (Tib. 36). Claudius properly suppressed the Druidic cult (*Claud.* 25.5). Also praiseworthy was his expulsion of Jews from Rome, since the Jews were always causing disturbances there at the instigation of Chrestus (*Claud.* 25.4). (This could be a confused reference [Chrestus/Christus] to disputes between Jews and Christians over the messiahship of Jesus, or Chrestus [a not uncommon name] may simply have been an agitator who was writing up the Jewish community in Rome at the time [Benko 1969:408–13].) Suetonius also noted with approval that Nero had inflicted punishments on the Christians, a sect which professed a new and mischievous belief (*Ner.* 16.2).

JOAN BRUEGGEMAN RUFE

SUFFERING. The Bible portrays innumerable examples of suffering. It could come in many different forms—a loss in battle, destruction of the nation and the symbols of worship, ravaging illnesses, premature death, great physical pain, rejection and loneliness, spiritual torment such as guilt or disbelief about God's goodness and concern. The list could go on (e.g., see Gerstenberger 1980:22–102). When such calamities occurred, whether to individuals, to larger groups within the nation, or to the nation as a whole, efforts were made to answer the many questions that would arise. What went wrong? Where did the suffering come from? Who brought it? How does God fit into this? Why would God bring (or allow) such terrible things to happen to the people whom God has chosen for his own?

There are several obvious places to look for biblical interpretations of suffering, such as the story of the Fall (Genesis 3), the Deuteronomistic History (DH), the book of Job, and gospel accounts of the crucifixion of Jesus. The experience of the exile was a crucial time for reconsidering many traditional ways of seeking meaning in suffering. The same could be said for the Christian church's need to explain why the messiah should die. Some biblical passages deal with suffering less as an intellectual problem of theodicy than as a process of coping with terrible reality (e.g., Lamentations, individual and corporate laments in the Psalter, and Jeremiah's Confessions).

C. The New Testament
1. The Gospels
2. Epistles and Revelation
3. Concluding Observations

———

A. Preexilic Interpretations

1. Creation and Fall. Genesis 2–3 gives one perspective on suffering. The world was intended to be a good place. (That is even clearer when we include Genesis 1 and read these first three chapters as a whole.) If the woman and man had heeded the one restriction about the tree of the knowledge of good and evil (Gen 2:17), suffering as we know it might never have entered the world. But they disobeyed (3:6–7) and opened the door to pain and suffering. God pronounced curses on the snake, the woman, and the man (Gen 3:14–19), and the world has been filled with pain and misery ever since.

The story of the Fall is the basic etiology for the presence of suffering in the world. It provides an explanation for the incongruity between the intention of God and the reality of a suffering world. There is already a theodicy in this initial story. God is good and powerful and just. God made a good world for the humans to enjoy. The human beings—the man and the woman—are the ones who must bear the responsibility for the pain and suffering of the world. This is the story of the whole human race. The lesson here is that it has been so from the beginning: We are all born into a world in which we are vulnerable to suffering.

2. The Sins of the Fathers. A number of biblical texts offer another perspective on human suffering (Exod 34:6–7, with parallels in Exod 20:5–7, Deut 5:9–10, and Num 14:18). The idea presented here is that the cycle of sin and suffering that began with our first parents is perpetuated from generation to generation. We are already paying for the sins committed by our grandparents, even as we are behaving in ways that will bring distress to the generations which follow us. Sins have their consequences. There are cause and effect relationships built into the order of creation (see Koch 1983). One cannot act with impunity, expecting to escape retribution while defying God's law. If the punishment does not come directly on the head of the offender, it will nevertheless work itself out eventually in the life of one's children or grandchildren. In the time of the exile, some of the victim's of that disaster protested that they should not bear the brunt of sins committed by their parents (see Ezekiel 18 and Jer 31:29–30). It may seem unfair, but it does describe reality. Sin leads to suffering. Someone will be hurt and, in turn, will pass that hurt on to others. Suffering resulting from sin is a corporate matter, infecting the whole society, not necessarily seeking out the most wicked perpetrator of evil upon whom to inflict the most severe suffering.

3. Preexilic Prophets. With acute insight, the great prophets (Amos, Hosea, Isaiah, Micah, Jeremiah, and Ezekiel) identified the decadence, injustice, and idolatry of their society. They knew that such behavior could lead only to disaster. They made a connection between the sins of the people, especially of the political, religious, and business leaders, and the national disaster which was coming. The people deserved what would happen to them, though there were pious folks who would surely have to bear the suffering along with those most deserving of it. In a time of national disaster, when a whole nation is being destroyed, there is no such thing as a safe haven for even the most righteous. Jeremiah's suffering was even more acute than others because he knew what was going to happen and his position as God's spokesperson made him an outcast from his own people. Baruch, Jeremiah's scribe, lamented his own unhappy situation and was told, by God through Jeremiah, that God would keep him alive, but Baruch could not hope for much more than that in a destructive time such as his (Jer 45).

4. Deuteronomy and the Deuteronomistic History. The Deuteronomistic corpus, obviously, was not completed until the time of exile. It does seem proper, however, to treat its understanding of suffering as a

preexilic tradition. In some ways, it represents the epitome of that interpretation, the supreme effort of the historian to make logical sense out of the ebb and flow in the fortunes of the nations of Israel and Judah. Times of prosperity were rewards for faithfulness to God. Disaster and chaos were the result of sins committed by the people.

The whole book of Deuteronomy has a hortatory style; there is an urgency about the message. The law must be obeyed or there will be dire consequences. If it is kept, there will be prosperity and a long habitation on the good land. The series of blessings and curses in Chapters 27 and 28 make clear the connection between ethical behavior and what will surely follow. Special attention could be paid to Deut 28:35, in which we are told that those who disobey God's commandments may find themselves covered with grievous boils from head to toe. Job's counselors perhaps knew this text as they looked for an explanation for his misfortune. Deut 30:15–20 is a good summary of the viewpoint of Deuteronomy. God has given the people a choice: they can choose good and live long on the land, or choose evil and be driven off the land. This probably represents the dominant understanding of the origin of suffering up until the time of the exile.

The story of Achan and his sin in Joshua 7 is a difficult and unpleasant one. Achan keeps some of the booty that was intended for the Lord, and as a consequence, things go badly for the Israelites in subsequent battles. When Achan's sin is found out, he and his whole family must be purged from the society. Suffering comes from human sin. The sin of one can have ripple effects, bringing suffering to all the people. Suffering is caused by human sin, but it may be the sin of another, not necessarily one's own sin, that brings suffering.

The stories of the judges in the book of Judges are set into a pattern that shows this same belief that suffering is retribution for sin. The overall scheme is laid out in Judges 2:6–23. When the people were unfaithful, God would send an enemy to torment them. Then, in response to their cries for help, God would send a judge to deliver them from their adversaries. After the judge died, they would revert to their idolatries and the whole process would repeat itself. The history of Israel thus makes sense. God is at work to see that justice is done. People's decisions can determine what fate awaits them. In this view, suffering is an indication that wrong choices have been made. They can be identified and lifted up as a reminder not to make the same mistakes again.

In 2 Kings 17, the historian provides a summary of why the N kingdom came to an end. There is a reason that can be discovered: The world makes sense; this is a moral universe, good is rewarded and evil is punished. God has the power and the will to see that it will happen.

At the end of the DH, there are, apparently, a few problems fitting all the historical data into this neat system. Why should Manasseh, the worst king of all, live so long and in comparative ease? (The terrible consequence of his reign will not occur until later—2 Kings 21:10–15.) Why should Josiah, the great reform king, die a premature death in a stupid political alliance, leaving the people in the hands of such atrocious kings as Jehoiakim and Zedekiah? (The Huldah oracle attempts to show that Josiah was actually better off dead so he would not be present to witness the execution of God's wrath on Judah—2 Kings 22:14–20.) The end of the history leaves us with the ambiguous (at best) hope that at least there is a son of David alive and well and receiving some respect from the king of Babylon (2 Kgs 25:27–30).

5. Concluding Observations. (a) In the preexilic traditions, the dominant interpretation of suffering is that it is the *result of human sin.* We find it in the Penteteuchal sources, in the preexilic prophets, and in the DH.

(b) There is a *strong corporate sense* in all of these texts. Genesis 3 deals with the whole human race; Deuteronomy, the prophets, and the DH are interpreting the fate of the people, the nation. They are not attempting to show that an individual's suffering or lack of same is directly related to that person's obedience to God. Life is too complicated to draw that precise a cause-and-effect connection. Adam and Eve sinned, so we are all, whether relatively good or bad, subject to pain and death. Achan sins and the whole nation suffers. The interconnectedness crosses generational lines so that even the sins of those who are no longer alive leave a legacy of suffering. The Babylonians destroy all in their path, the wicked and

the pious, the unjust and the obedient. Suffering is caused by sin, and its victims include the deserving as well as those who are innocent bystanders (as Jeremiah and Baruch).

(c) God is active in this world to execute justice. God raises up enemies to torment the disobedient in the time of the Judges. God brings Babylon against Jerusalem. This understanding of God's part in human suffering keeps a balance between God's power and justice. What happens is under God's influence, even though terrible things may be taking place. But they are understandable in light of the sin that initiated the punishment. There has been some debate about how actively God manipulates events to bring suffering. Some have preferred to suggest, and tried to make a case from biblical texts, that the process of suffering following sin is almost an automatic one built into creation so that God's participation in bringing calamities on people is minimized (see Koch 1983).

(d) Even in preexilic literature, the doctrine of retribution is not the only interpretation of suffering. God may actually arbitrarily without giving any explanation. In Exod 4:11, in response to Moses' assertion that he cannot go back to Egypt to free the people because he is "slow of speech and tongue," God says, "Who has made man's mouth? Who makes him dumb, or deaf, or seeing, or blind? Is it not I, the LORD?" God's power is here asserted. There is no attempt to interpret one's physical limitations or handicaps as a result of sin. They are merely there and we have no explanation. But God must have something to do with their existence because God is God.

In Genesis 3, the snake suddenly appears as one of God's most subtle creatures. In this fundamental story about how suffering entered the world, the humans and God are not the only actors. Though the main point of the story, as already stated, is the human sin which caused the trouble, it is important to note that there is mystery and complexity added to the story by the presence of the snake. We do not have here a full-blown notion of Satan or the devil, but we do have a recognition by the biblical writer that there is a mysterious force for evil that seems to push humans into actions that will be detrimental to themselves and to others. Why there should be such a hostile creature in this "good" (Heb *ṭôb*) world that God has just created is part of the mystery. It is important that Yahweh alone is God and that the serpent is only one of God's creatures. There is no cosmic competition or dualism present here.

In Deut 8:1–6 we see a view of suffering which will gain in strength later in the biblical traditions. The suffering may have some benefit, either for the sufferer or others. God may be using it to teach something. Thus the wanderings of the people of Israel in the wilderness was a time of humbling and testing (8:2), teaching them that one does not live by bread alone (8:3). God has disciplined the people as a man disciplines his son (8:5). According to Judg 2:20–23, God will not drive out all the nations left in the land when Joshua died. Some will be left there in order to test Israel, to see whether they will walk in the way of the Lord or not. The conclusion of the Joseph story (Gen 50:15–21) speaks of the benefits that many received through the suffering of one wise and righteous person: Though Joseph's brothers meant evil against him, God used Joseph's suffering to save many from famine.

B. Exilic and Postexilic Response to Suffering

The catastrophe of the exile strained the credibility of the earlier consensus as presented by the prophets and historians. The disaster was too severe and lasted too long. Sinful though they be, the people of Judah were still more righteous than their punishers, the Babylonians (Hab 1:12–13). One does not punish one's children by killing them. The terrible events that followed rapidly on the death of Josiah made it difficult for many to believe that a God of justice was ruling the world.

1. Ezekiel 18 and Jer 31:29–30. Ezekiel confronts those who complain that "the fathers have eaten sour grapes and the children's teeth are set on edge" (18:2; see also Jer 31:29–30). The fathers had sinned and now the children are paying for it. That hardly seems fair. Ezekiel counters that the soul that sins shall die (18:4; see also Deut 24:16). All are responsible for their own life. They will not have to pay the penalty for sins committed by their fathers, nor will they be saved by the good deeds of their fathers: Whether they live or die depends on their own actions. There are many ways to understand this important chapter in Ezekiel. It does seem to indicate an effort to move the doctrine of retribution away from a strictly corporate understanding. One need not be swept along by the sins of society or even one's own family. Individuals make their own decisions and determine their own futures. There is certainly some

tension between this movement by Ezekiel and the earlier understanding that one can expect to bear the sins of ancestors to the third and fourth generation. Was that earlier belief incorrect? Can each generation start afresh without being victims of its predecessor's choices? Probably not. But Ezekiel (if his point is not overstated and absolutized into a general principle) wants to say that the present situation should not be excused by claiming that it was hopelessly predetermined in the past (and therefore we cannot be held accountable for our own actions).

2. Isaiah 40–55. After a couple of generations of exile, the people were demoralized. If the earlier tradition was right that their defeat was God's punishment on their disobedience, would it ever end? Had God cut them off forever? Or perhaps they had been deluded all along, and their destruction was a sign that the Babylonian gods were superior to Yahweh, who couldn't provide help when needed. Second Isaiah appeared to provide a word of hope. He did not reject the older view: Judah's suffering, at least up to a certain point, was punishment for sin (Isa 42:18–22, 24–25; 43:24b; 47:6). But suffering is not to be defined only in negative ways (as punishment). It can have positive meanings. If the people have the faith to see it, they may discover that their suffering is part of God's work in the world. They are God's witnesses (as in 43:9–10), called to be "a light to the nations" (as in 42:6 and 49:6). Israel, the Servant of Yahweh, has a mission to reach out to all the world. Other nations will see what God is doing through his chosen people and they will be persuaded to join in worship of the one true God, the God of Israel. Thus Second Isaiah turns away from defining suffering only as punishment (though that point is not entirely negated) to a more hopeful, future-oriented understanding. God will work some greater good for others out of the suffering of the faithful.

3. The Lament Tradition. The tradition of lament is not new in the exilic times. The children of Israel cried out to God for help when they were slaves in Egypt and during their wilderness wanderings (Exod 3:7; Num 11:1). The repentant idolators during the time of the Judges implored God to deliver them (Judg 3:13). David mourned the loss of friends and family (Saul, Jonathan, Abner, and Absalom; 2 Sam 1:17–27; 3:33–34; 18:33). Jeremiah called to God for vengeance on his enemies and vindication of his miserable life (Jer 17:14–18; 18:19–23). But in the time of exile, lament was particularly prevalent as a response to catastrophe, meaninglessness, and delay in the redemption of the faithful and judgment on the wicked (e.g., book of Lamentations; Psalms 44; 137). The lament calls God into accountability. God should act fairly and quickly. The lament allows for honest interchange between humans and God, the freedom to admit even bad theology and hostile thoughts. The lament turns to God as the ultimate source of help and, in the typical lament form, ends with the assurance that God has heard and will save. The lament does not solve all of the sufferer's intellectual questions about the origin and meaning of the suffering, but does provide a structured way for the faithful to bring their suffering to God's attention and to cope with it.

4. The Book of Job. Job is the classic biblical discussion of the problem of suffering. It addresses these questions in greater depth and length than any other biblical book. Though there are many problems with dating, the best guess is that the major part of the book was written in the late exilic or early postexilic period (with the prose sections possibly earlier and the Elihu speeches possibly later). This would be a time when questions of meaning in suffering, whether or not it was deserved, and discontent over the prosperity of the wicked would be of great and immediate relevance, not only to individuals but to a whole people who had thought they were God's chosen nation and now had been virtually destroyed.

The book of Job examines in great detail all the best answers that the earlier religious tradition had to offer in order to find meaning in suffering. Job's three counselors (and later Elihu) are permitted to present their interpretations of Job's suffering by drawing from what they have learned in the past. Their answers are primarily variations on a retribution doctrine, especially as developed in the DH, in much Wisdom literature (e.g., Proverbs 10:23–30 or Psalm 1), moving toward a more individualized interpretation of suffering as punishment (a direction already seen in Ezekiel 18). Job's friends believe that a just God rules in the world. Such awful things would not happen to Job unless he was deserving of them. Job looks like an innocent person, to be sure, but there must be some sin somewhere which has caused the trouble. They take upon themselves the pastoral task of trying to help him locate the flaw

which can then be repented so that he can return to a better life. In his first speech (chaps. 4–5), Eliphaz is somewhat puzzled by Job's apparent innocence and shares the insight that no mere mortal can be righteous before God (4:17). Job may be better than some, but he is still a sinner and, therefore, deserving of his fate. Eliphaz also softens the harshness of his theories of retribution (in 5:17–27) by suggesting that Job's suffering may be good for him. The man who can learn from the chastizing of the Almighty can be happy for the experience.

Job rejects all the answers presented by his would-be comforters. He is still much influenced by his own religious tradition, and he wants the law of retribution to work. The problem is that it is not working. Job has kept up his end of the bargain by his pious and ethical life (see especially his summing up in chaps. 29–31), but God has rewarded him with one disaster after another. And so Job assails God for God's cruelty and injustice (see 9:20–24; 16:6–17; 19:5–13).

There is much debate over how the prologue/epilogue fits with the rest of the book of Job. Whatever else might be said, it is absolutely essential that we, as the readers of the book, know what God says in both the prologue and epilogue. In the prologue, God, in conversations with Satan, declares that Job is blameless and upright and turns away from evil (1:8, 2:3). In the epilogue, God says that the three counselors were wrong about Job while Job spoke what was right (42:7). Without that information, we would not know whether Eliphaz and the rest were right to blame Job for his disasters, or whether Job is right to protest that he was a victim of injustice. With the inclusion of the prologue and epilogue, it is clear that Job is a case of innocent suffering. He does not deserve his fate. The doctrine of retribution cannot be applied to every case of individual suffering as if it were a universal explanation.

The book of Job is certainly a critique of a rigidly applied doctrine of retribution to explain all suffering. But does it offer any alternative explanations? The best place to look for the "answer" of the book of Job to the dilemma of human suffering is in the God speeches (chaps. 38–41). When God finally speaks to Job (an audience which Job had desired for a long time), God offers no reasons for why Job had suffered. All of Job's questions, framed in juridical terms of guilt and innocence and court trials, were simply ignored. Rather, God proclaimed the wonders of the creation, human inability to understand the complexities of the universe, and the assurance that God will take care of those matters which humans can neither comprehend nor control. In the end, at least according to the usual interpretations of these speeches by Jewish and Christian religious communities, Job is satisfied with this kind of answer that is no answer. Though his intellectual questions are not resolved, he seems content to live with the mystery. His relationship with God has been restored so that he is more willing to leave the unknown in the hands of a God that he can again trust. The abundance of rich creation imagery points to the presence and care of God in the world even when we cannot clearly see God's activity in either our personal or community's history.

The prologue (chaps. 1–2) is one of the very few OT passages that speaks of a heavenly being called "the Satan" who is an adversary of human beings, enticing and testing, seeking their hurt. This introduces another dimension in the biblical interpretation of suffering. Theories of suffering as retribution for sin concentrate on humans and God as the actors in the origin of suffering—humans sin and God executes justice. The presence now of a third party complicates matters even as it helps to explain. How does the Satan relate to God? In Job, God clearly has the last say about what the Satan may do (1:12; 2:6), but one wonders why God allows the Satan to do any harm at all. And how does the Satan relate to humans? Are they still responsible for their own actions if they get a little push from some supernatural force who leads them into self-destructive behavior? At least the presence of a heavenly force for evil allows a sufferer to shift blame from self or God when neither of those options seems appropriate or helpful.

5. Prophetic Eschatology and Apocalypticism. When disillusionment deepened and hopes for a better life in this world diminished, prophets appeared to paint wonderful visions of a new world in which there would be no war (Mic 4:1–4 and Isa 2:2–4), wild and domestic animals would sleep together in peace (Isa 11:6–9), fields and vineyards would bountifully supply everyone's needs (Amos 9:11–15), and all people will know what God's will is and actually do it (Jer 31:31–34). Such dreams of the future allowed people to express their hope that God would not allow the present state of suffering to remain forever. Whatever

the origin of the suffering, it would one day be removed, if not in this life and the present age, then in a visionary future age which is in continuity with the present but also radically different from the history of the world up to this time.

When pessimism about this world became particularly acute, apocalyptic visions (as in the book of Daniel, Ezekiel 38–39, Isaiah 24–27, and parts of Zechariah) presented an even greater discontinuity between the present world and the future victory over suffering and evil. The DH was perhaps too confident about seeing the working of God *in history.* To the apocalyptic mind, evil has the upper hand. God will have to intervene to bring the present world order to a close before justice can be done and suffering removed. Suffering is to be expected in this age which is under the dominion of evil powers. But there is hope for the sufferer because God will win the final victory over all that can harm his creation. Even those who have died, martyrs in an evil age, will be redeemed because God will bring them back from the dead in order to execute the justice that was not granted them during their earthly life (Dan 12:1–2). Even death cannot frustrate God's justice. Though pushed off into the distant future, even to a future age, retribution will be forthcoming. The good will be rewarded and the wicked punished.

6. Concluding Observations. During the exilic and postexilic periods a number of changes were taking place in the earlier understanding of suffering as corporate punishment for sin, evidence of a just God at work in the world.

(a) The doctrine of retribution began to be *applied to individual lives* as well as to suffering incurred by a whole people. If individual persons suffer, perhaps they have brought it on themselves and are not merely suffering as part of a fallen race or decadent society. Ezekiel seems to move in this direction, as do Job's counselors.

(b) There are efforts to move beyond suffering as punishment in order to see *redeeming value in suffering,* either for others or for the sufferer. Isaiah 40–55 speaks of a servant who takes on suffering for the benefit of others. Both Eliphaz (Job 5:17) and Elihu (Job 33:12–15; 36:9–12, 15) suggests that God uses suffering to teach people, to save them from worse dangers that will come if they do not change their ways.

(c) There was much protesting of God's injustice. The sense of unfairness would be worse as one began to believe that just retribution should occur even in individual lives. Perhaps the whole nation deserves its fate, but what about women, children, the pious, the righteous who suffer as much, and sometimes more, than the obviously wicked? (See Hab 1:12–13, many lament psalms, Job's speeches, Jeremiah's Confessions, and the book of Ecclesiastes.)

(d) There is more willingness to talk about *the demonic as a contributor to suffering,* either by causing the trouble directly or by enticing humans to do what will bring suffering down on themselves. The only three OT references to Satan as a superhuman figure are from this time—Job 1–2, 1 Chronicles 21, and Zechariah 3.

(e) There is a looking ahead into *the distant future as the arena where justice will finally be achieved.* In the meantime, the world is so hopelessly in control of evil forces that suffering is more the norm than the exception. These "last times" may still come within the framework of history as we know it, or it may take a dramatic intervention by God to bring in a new age. The time of final vindication may not come until good people have already perished, in which case they will arise from the dead to receive their reward (Dan 12:1–2).

(f) Finally, there are some attempts to recognize and live with the ambiguity, the mystery, not to push the logic of theodicy to the point where one must blame humans in order to protect God's justice and power (Job's friends) or doubt God's justice in order to protect one's integrity (Job himself). Job finally seems willing to live with unanswered questions. Lament psalms, in their movement from lament to praise, also seem more concerned with preserving the relationship with God than finding satisfactory solutions to the intellectual dilemma of suffering.

C. The New Testament

In their attempts to understand suffering, the early Christians were shaped and informed by these biblical traditions already mentioned. But NT discussions about suffering are very often preoccupied with

two questions—how to make sense out of the suffering of Jesus, and how to understand the suffering experienced by early Christians because of their allegiance to Jesus as Christ.

1. The Gospels. The old idea of retribution was still prevalent. God was still regarded as a good and just God, and it was believed that evil would be punished and good would be rewarded, although this will not necessarily happen within this life. In this life, one cannot assume that sufferers deserve their fate. Life is too complicated for that. It may even be true (as in the Beatitudes of Matt 5:3–12) that the ones who are blessed are the mourners, the meek, the hungry, the poor, and those who are persecuted for a righteous cause. In a corrupt world, the ones who appear to be successful may actually be the evil ones who have come unjustly to their reward. Suffering may actually be a sign that you are one of the faithful rather than being the consequence of a sinful life.

In Luke 13:1–5, Jesus would not concede that those who met unfortunate ends at the hands of Pilate or that those who were crushed by the Siloam tower were any worse than those who might have escaped. The incidental calamities of this life cannot be explained, but everyone will be held accountable in some future judgment.

In John 9, Jesus says that the man born blind was not afflicted because of some sin committed by either his parents or himself. This is a clear word of rejection of an absolutized doctrine of retribution which connects sin to punishment in individual cases of suffering.

The suffering and death of Jesus was a problem for the early Christians. The Messiah was supposed to usher in a new kingdom, not get himself killed. Clearly, Jesus did not deserve to die. Luke has Jesus tell the travelers to Emmaus that prophets have spoken that it was necessary that the Christ should suffer (Luke 24:25–26). (In Acts 3:18, Peter also refers to such prophecies of a suffering messiah.) The OT texts that come the closest to predicting such a Messiah are those in Isaiah 40–55, particularly the Servant Songs, and especially Isaiah 53. The suffering and death of Jesus thus came to be viewed as part of God's design: It was for a greater good, the salvation of the human race. Christ died for others. And, by analogy, the followers of Jesus should be willing to take up their own crosses, to be willing to suffer for the sake of the spreading of the gospel (e.g., Matt 16:24–25). Thus the suffering of the early Christians could be interpreted as suffering for others, following the example of Jesus Christ.

Though there are characteristics of apocalyptic literature at many places in the gospels (such as the presence of demonic forces and belief in the resurrection of the dead—e.g., Mark 12:18–27 and parallels), a few passages are more obviously apocalyptic in tone (e.g., Matthew 24, Mark 13, Luke 21). They speak of the great trauma at the end of the age when God will act decisively to end the reign of sin, evil, and suffering once and for all.

2. Epistles and Revelation. In words of comfort to fellow Christians, early Christian writers concentrated on two areas of encouragement to those who were suffering. First, they should be assured that no matter how severe they are treated by this life, the promise of resurrection is there for them. If Jesus rose from the dead, then surely the followers of Christ will also be raised into a wonderful new existence where Jesus has defeated all enemies (1 Corinthians 15). Even if some have already died before Jesus has returned, the mourners should not grieve and be without hope. Those who are alive will not be gathered to God before those who have fallen asleep (1 Thess 4:13–18). Justice will finally be done. The dead will be raised and judged by what they have done—the good to be rewarded and the evil to be punished (Rev 20:11–15, 22:12). For those who have favor with God, there will be no more tears, death, mourning, or pain. All the former things will pass away (Rev 21:4).

A second theme of good news in the midst of suffering is the assurance that God can work good even out of suffering. Therefore, it is even possible to rejoice in your suffering, with the knowledge that it will produce endurance, character, and then, hope. The one who suffers can be assured that whoever hopes in God through Christ will not be disappointed (Rom 5:3–5). Suffering can be understood as discipline, sent by God to make us better persons, just as earthly fathers sometimes must discipline their sons (Heb 12:3–11, containing quote from Prov 3:11–12).

3. Concluding Observations. (a) The NT continues the direction begun in exilic times of being less certain that God's justice will be fully executed within this world as presently constituted. With regard to

suffering, this meant that people can seldom have the kind of assurance expressed by the DH, and can be skeptical about those who continue to identify cause-and-effect relationships between the sins that people do and the suffering that comes to them. Particularly, this does not work when examining the suffering of an individual person. God will still see that justice is done, although it may not be apparent in this life. More likely, it will come in its fullness either through death and resurrection or at the Second Coming, whichever comes first. In the meantime, the faithful will have to tolerate a certain amount of suffering, strengthened in the knowledge that it will not last forever and that one day they will receive their reward.

(b) NT writings put a heavy emphasis on suffering for others as a calling for a Christian. Just as Jesus died for others, so should Christians be willing to suffer for the good of others and the spreading of the gospel. Such an explanation could be very helpful when suffering was clearly the result of a public witness to an unpopular religion; however, it might not be so helpful in explaining common, ordinary suffering that seemed not to be directly or indirectly related to any great witness.

(c) The benefit of the suffering might fall on the sufferers themselves rather than on other persons. Though suffering is, by definition, negative, it is still possible to receive some personal benefits from such an experience. As Paul says, it is even possible to rejoice in one's suffering, looking back and realizing that lessons have been learned, that humility has been realized, that hope has met response, and that God's reassuring presence has been with the sufferer even in the depths of suffering.

SUICIDE. The taking of one's own life is always morally problematic. Religiously motivated suicide is particularly sensitive as an issue in the history of Jewish and Christian thought, and is closely related to issues of martyrdom and redemptive suffering generally. See also MARTYR, MARTYRDOM.

A. Introduction: History of the Problem

The idea that suicide is both a sin and a crime is a relatively late Christian invention, taking its impetus from Augustine's polemics against the "suicidal mania" of the Donatists in the late 4th and early 5th centuries and acquiring the status of canon law in a series of three church councils of the 6th and 7th centuries (Fedden 1938:133–34). In other words, the act of taking one's own life, which had been accepted, admired, and even sought after as a means of attaining immediate salvation by Greeks and Romans, Jews and Christians throughout antiquity, now became the focus of intense Christian opposition.

The term "suicide" is itself something of a novelty (Daube 1972:418–29). The *OED* dates its first occurrence to 1651, though the word can be found slightly earlier in Sir Thomas Browne's *Religio*

Medici, written in 1635 and published in 1642 (Alvarez 1970:50). The term was still considered enough of a neologism for Dr. Johnson to exclude it from his *Dictionary* in 1755. Instead, condemnatory expressions such as "self-murder," "self-killing," and "self-slaughter" were used to describe the act of taking one's life, emphasizing its association with murder. Hence the cleverness of John Donne, the first to compose a formal defense of suicide in English, by entitling his treatise *Biathanatos* (a slightly garbled version of the Greek *biaiothanatos* or "one who dies violently") to avoid the pejorative association of the act with murder. Throughout this treatise, Donne employed (and perhaps coined) the term "self-homicide," an intentionally neutral designation, since the word "homicide" could apply to criminal acts as well as to justifiable and even commendable ones (Daube 1972:419–20).

The arguments of Donne and his successors, notably Voltaire and David Hume, did little to overturn Christianity's moral and religious condemnation of suicide. It took the work of the social sciences, launched by Enrico Morselli (1879) and Emile Durkheim (1897), to change the situation. The phenomenon of suicide was now seen not as an individual problem but as a social one, reducible to statistical analysis. At about the same time medical doctors began to view suicide as a result of illness, specifically depression and other types of mental disorder. Hence suicide came to be seen as a "symptom" of individual psychopathology and social disorganization.

There were, of course, certain advantages in the "medicalizing" and "social scientizing" of suicide. The act was eventually decriminalized: the successful suicide could now be buried and his family was no longer disinherited; the unsuccessful suicide was spared execution. But something was also lost. The more suicide came to be regarded as a "symptom," the less it was seen as an enduring moral and religious question. "Despite all the talk of prevention, it may be that the suicide is rejected by the social scientist as utterly as he was by the most dogmatic Christian" (Alvarez 1970:74).

B. Suicide in Greek and Roman Antiquity

Although it has been customary to regard the discussion of suicide in Greek and Roman antiquity as a distinctly Stoic phenomenon, this should not obscure the fact that nearly all the philosophical schools and religious movements of the Greco-Roman world had worked out their own positions on the problem of suicide (Hirzel 1908; Grisé 1982). Admittedly, in the Roman period, many of the more famous suicides (or martyrs) were Stoics, and in the writings of Seneca in particular the act of taking one's life was extolled as the greatest triumph of an individual over fate. Yet, the phenomenon was by no means limited to Stoics. The remark of E. R. Dodds, that "in these centuries a good many persons were consciously or unconsciously in love with death," may be an exaggeration, but it is an exaggeration for a point (1965:135). Indeed, as A. D. Nock observed, the first century witnessed the rise of what can only be described as a "suicide cult" (1933:197).

While accounts of suicide can be found in Greek literature as early as Homer (e.g., Epicaste in *Od.* 11.271–80), who regarded the act as something natural and usually heroic, it is really Plato's *Phaedo* which provides the starting point for and remains central to the discussion of suicide throughout antiquity. In the *Phaedo,* the condemned Socrates argues that the philosopher should welcome death since he may expect to attain "the greatest blessings in that other land" (64a). In fact, Socrates goes so far as to urge every person with a worthy interest in philosophy "to come after me as quickly as he can" (61bc). Recognizing the provocative nature of his remark, Socrates immediately issues a disclaimer: "Perhaps, however, [the philosopher] will not take his own life, for *they* say that is not permitted" (61c). The apparent contradiction only serves to confuse the issue among Socrates' disciples. One of them, Cebes, therefore asks: "What do you mean by this, Socrates, that it is not permitted to take one's life, but that the philosopher would desire to follow after your dying?" (61d). Socrates responds by appealing first to the Pythagorean (or perhaps Orphic) doctrine that an individual is placed in a kind of prison—the body—from which he must not set himself free or run away (62b). With typical playfulness, however, Socrates confesses that this "secret doctrine" is too obscure for him to be certain of its meaning. He offers therefore a simpler principle: "The gods are our guardians and we humans are the possession of the gods … If one of your possessions should kill itself when you had not intended that you wished it to die, would you not be angry with it and punish it if you could?" (62bc).

By this analogy Socrates implies that an individual, who is one of the gods' possessions, ought not to take his own life because that would mean usurping a privilege which belongs only to the gods. This statement, in particular, led some interpreters, both ancient and modern, to conclude that Socrates (or Plato) condemned suicide. But the argument is less straightforward and more subtle than might appear at first glance. On the one hand, "Socrates' sweetly reasonable tone repudiates suicide, yet at the same time he makes death seem infinitely desirable; it is the entry to the world of ideal presences of which earthly reality is a mere shadow" (Alvarez 1970:60).

Furthermore, as John Rist has noted, Socrates left one point obscure, and this point remained at the center of the discussion of suicide throughout antiquity, to appear again in the first book of Augustine's *City of God* (1969:234). Socrates concludes that "perhaps from *this* point of view it is not unreasonable to say that a person must not kill himself until god sends some necessity *(anangke)* upon him, such as has now come upon me" (62c). By this "loophole" Plato implies that Socrates decided to take his own life *voluntarily,* irrespective of the sentence of death hanging over him, which was merely coincidental. The importance of this account for the subsequent discussion of suicide in antiquity should not be underestimated. Indeed, the death of Socrates served as the paradigm for countless others. At the same time, however, and owing to their playfully ambiguous character, the statements attributed to Socrates in the *Phaedo* were also used as a way of moderating against the practice of suicide.

The influence of the *Phaedo* on subsequent discussions and actual cases of suicide is pervasive. A few examples must suffice. According to the doxographic tradition preserved in Diogenes Laertius' *Lives of the Philosophers* (7.28), Zeno, the founder of Stoicism, was leaving his school one day when he fell and broke his finger (in other accounts, his toe). Striking the ground with his fist, he proceeded to quote the following line from a lost tragedy of Timotheus, the *Niobe:* "I am coming; why do you call me?" Zeno then killed himself by holding his breath. Adolf Bonhoeffer has observed that Zeno seems to have interpreted this "accident" as a divine summons; hence the quotation from the *Niobe* (1894:38–39; cf. Rist 1969:243). Zeno supposed that he had received the signal to depart, perhaps because his philosophical work was complete or because he was no longer capable of living "according to nature." In any case, the story of Zeno's death echoes the rationale of Socrates in the *Phaedo.* Like Socrates, Zeno believed that god gives the sign for an individual's departure.

The account of the death of Cleanthes, Zeno's successor, admits of a similar interpretation. He refused to resume eating after an inflammation of the gums had led to a two-day fast. "Declaring that he had already gotten too far down the road, Cleanthes went on fasting the rest of his days until his death at the same age as Zeno's" (Diog. Laert. 7.176).

The views of the later Stoics betray even more clearly the influence of the *Phaedo.* In the *Tusculan Disputations,* Cicero recounts the death of Cato of Utica and then compares it with the death of Socrates.

> Cato departed from life with a feeling of joy in having found a reason for death; for the god who is master within us forbids our departure without permission. When, however, god himself has given a valid reason [*causam iustam*], as he did in the past to Socrates and in our day to Cato and to many others, then with certainty your true wise man will joyfully go forth from the darkness here into the light beyond. All the same, he will not break the bonds of his prison house—the law forbids it—but as if in obedience to a magistrate or some lawful authority, he will go forth at the summons and release of god.
>
> For the whole life of the philosopher, as the same wise man says, is a preparation for death (1.74).

According to Plutarch, Cato himself was inspired by Socrates to kill himself and read the *Phaedo* twice the night before he fell on his sword (*Cat. Min.* 67–68).

By the time we reach Seneca in the 1st century A.D., we have witnessed the "apotheosis" of suicide. Instead of invoking the Socratic and earlier Stoic view that the wise man will not take his own life until god gives the signal to depart, Seneca emphasizes the right to die in general: it is the act *par excellence* of the free man, the path to liberty, proof that an individual cannot be held against his will.

> In any kind of slavery the way lies open to freedom. If the soul is sick and because of its own imperfection unhappy, a man may end its sorrows and at the same time himself … In whatever direction you turn your eyes, there lies the means to end your woes. Do you see that cliff? Down there is the way

> to freedom. Do you see that ocean, that river, that well? There sits freedom at the bottom. Do you see that tree …? From its branches hangs freedom. Do you see that throat of yours, that stomach, that heart? They are ways of escape from slavery. Do you ask what is the path to freedom? Any vein in your body! (*On Anger* 3.15.3–4).

Like Cicero, Seneca frequently mentions Cato as an example of how to die bravely. According to Seneca, however, Cato *proved* his freedom by taking his own life. Although he still compares Cato with Socrates, he intentionally omits any suggestion that god provided a particular sign indicating death (e.g., *Moral Epistles* 13.14; 24.6–8; *Prov.* 2.9–10). This represents a considerable shift: "to allow for suicide in certain circumstances is one thing, to exalt it is quite another" (Rist 1969:248). Still, the difference is one of degree, for Socrates had also emphasized the benefits, and hence desirability, of death in general.

Seneca's famous *70th Epistle,* which to all intents and purposes is a panegyric to suicide (or freedom), begins with the maxim that "the wise man will live as long as he ought, not as long as he can," and continues by proclaiming that the wise man will consider the possibility of death long before he is under extreme *necessitas* (70.4; cf. Socrates' *anangkē*). Seneca emphatically opposes philosophers who condemn suicide as those who "shut off the path to freedom" (70.14–15). Indeed, it is the deity who has arranged things so that an individual can never be kept in this life against his will.

> Above all, I [sc. god] have taken pains that nothing should keep you here against your will; the way is open. If you do not choose to fight, you may run away. Therefore, of all things I have deemed necessary for you, I have made nothing easier than dying. I have set life on a downward slope: if it is prolonged only observe and you will see what a short and easy path leads to freedom (*Prov.* 6.7).

Thus it is by no means contrary to the will of god if an individual chooses to end his life at any time; it is precisely because of the divine order of things that one is at all times free to die. Furthermore, as Rist notes, it seems that not only is the choice of suicide open to everyone, it is also a particularly ennobling act. Even the "fool" can be transformed into a sage by a well-judged and opportune death (1969:249).

Seneca's fascination with suicide (in *Ep.* 24.25 he speaks of a *libido moriendi*) strikes the modern reader as exaggerated and extreme—indeed, pathological—but it would be a serious historical misjudgment to dismiss it as such. The fascination with voluntary death in this period was widespread and had, as Nock suggests, various causes: the aura surrounding suicide in legend and life, a certain stridency of self-expression, a desire for theatrical prominence, and the popular notion of the body as the prison of the soul (1933:198). To these should be added the idea of suicide as a means of self-divination, as a shortcut to immortality. Again, a few examples must suffice. The 2d century rhetorician, Lucian of Samosata, gives us an extraordinary (albeit sarcastic) account of how the Cynic philosopher Proteus Peregrinus, who at one time had been a Christian, burned himself to death at Olympia as a means of apotheosis (*Peregr.* 20–41).

Similarly, Epictetus, the well-known slave turned Stoic philosopher (fl. 100 A.D.), knew of a death-wish among young Greeks so strong that he felt obligated to rein it in. These young men appealed to him in the following manner: "Are we not akin to god, and have we not come from him? Allow us to go back whence we came; allow us to be freed from these chains that are fastened to us and weigh us down. Here there are thieves and robbers, and courts of law, and those who are called tyrants. They think they have some power over us because of this paltry body and its possessions. Let us show them that they have no power over us" (1.9.13–15).

The death-wish of these young Greeks has two causes: first, a longing to escape from earthly troubles and, in particular, from the prison of the body; but the obverse of this is an equally strong desire to return "home," to attain immortality by reuniting with the deity. In an attempt to restrain these men, Epictetus exhorted them in language reminiscent of Socrates in the *Phaedo:* "Men, wait upon god. When he shall give the signal to depart and set you free from this service, then you shall depart to him. But for the present endure to remain in the place where he has stationed you" (1.9.16).

Here it is important to note that Epictetus, like his contemporaries, was not opposed to suicide *per se;* he only thought it wrong to commit suicide without sufficient justification (in this case, without a "divine signal" to do so).

C. Suicide in Biblical Literature

One of the difficulties Augustine and later theologians had in defending their condemnation of suicide is that neither the Hebrew Bible nor the NT explicitly prohibits the act. The Hebrew Bible records five cases of suicide. In two of these, someone who was already wounded preferred to die by his own hand (or, more precisely, in one case, by the hand of his armor-bearer). When Abimelech was mortally wounded by a woman who had dropped a millstone on his head, he "immediately cried out to his attendant, his armor-bearer, 'Draw your dagger and finish me off, that they may not say of me, "A woman killed him!" ' So his attendant stabbed him and he died" (Judg 9:54).

Similarly when King Saul had been mortally wounded by the Philistines at Mt. Gilboa, he said to his armor-bearer, "Draw your sword and run me through, so that the uncircumcised may not run me through and make sport of me." When his armor-bearer refused, Saul grabbed the sword and fell upon it. Seeing that Saul was dead, the armor-bearer too fell on his sword and died (1 Sam 31:4–5; cf. 1 Chr 10:4–5). Note that although Saul was mortally wounded, his armor-bearer committed suicide purely out of devotion to his king.

The fourth case involves Ahithophel, once an adviser to King David who later deserted to serve David's rebellious son Absalom. When Absalom decided not to take Ahithophel's advice, Ahithophel hanged himself (2 Sam 17:23).

The fifth example is Zimri, an officer who treasonously murdered King Elah and had himself proclaimed king of Israel. When the army refused to follow him and laid siege to the capital, Zimri closed himself in the royal citadel and set it afire over him (1 Kgs 16:18).

To these one might add the example of Samson, who deliberately brought the Philistine temple at Gaza down on his head after being blinded (Judg 16:29–30). Later, Christian exegetes would interpret Samson's death as a symbolic foreshadowing of Christ's self-sacrifice.

The important point is that none of these biblical figures receives censure; indeed, their suicides are scarcely commented on, leading one to conclude that in ancient Israel the act of suicide was regarded as something natural and perhaps heroic (Daube 1962:83–87). The only instance in the Hebrew Bible where an individual considered death and perhaps wished to kill himself, but did not, is Job (7:15; 13:15).

In the NT there is only one clear case of suicide—the death of Judas—and, like the examples in the Hebrew Bible, it too is recorded without comment, although it is implied that Judas's act of self-destruction was a result of his remorse and repentance, and not an additional crime (Matt 27:3–10; Daube 1962:88–89). "Only much later did the theologians reverse the implicit judgment of Matthew and suggest that Judas was more damned by his suicide than by his betrayal of Christ" (Alvarez 1970:51). In Acts 16:27–28, Paul is said to have prevented the suicide of the Philippian jailor, no doubt in order to convert him.

The death of Jesus, at least as we have it in the canonical gospels, is ambiguous. Is it the execution of a criminal, an example of heroic martyrdom, or a case of suicide? (The same ambiguity would apply to Plato's account of the death of Socrates.) In an extraordinary passage in the Fourth Gospel (8:22; cf. 7:34; 13:33), we are told that the "Jews" understood Jesus' repeated sayings about his "going away" as a suicide threat. As is often the case in John, they may have spoken more wisely than they knew. Tertullian, for example, described the death of Jesus as a form of voluntary death, and he was followed by Origen in affirming that Jesus *voluntarily* gave up his spirit, since it was impossible that the deity should be at the mercy of the flesh (Fedden 1938:110). Even Augustine recognized that "[Jesus'] spirit did not leave his body against his will, but because he willed it to happen and he willed when and how it happened" (*On the Trinity* 4.16).

Now in strictly historical terms Jesus of Nazareth never expected to give his life "as a ransom for many." Rather, his intention was to bring about the restoration of Israel and to usher in the kingdom of God, an eschatological revolution which would be accomplished miraculously through Jesus himself acting as God's messianic agent. So conceived, his death was a tragic failure. By the time we reach the gospel accounts, however, a transformation has occurred: Jesus' death was not a mistake; his was not the execution of a failed apocalyptic prophet. On the contrary, it was precisely for this reason that Jesus came:

to redeem the world from sin through his sacrificial death. Hence the emphasis in all the gospels on Jesus' prior knowledge of his fate and on his willing and voluntary acceptance of that fate. If it is not always easy to distinguish between suicide and martyrdom, between killing oneself and allowing oneself to be killed for a cause, a principle, or belief, then Tertullian and Origen (even the "Jews" in the Fourth Gospel) were not wrong in describing Jesus' "going away" as a form of suicide. How else are we to make sense of the provocative statement of the Johannine Jesus: "No one takes my life; I lay it down of my own free will" (John 10:18)? That later theologians judged the act of suicide a sin for which Jesus' similar act could not atone is a telling indication of the distance Christianity has traveled in its thinking about suicide.

More remarkable even than the second-hand interpretations of Jesus' death in the gospels are Paul's own reflections on death in Phil 1:21–26, a passage in which the apostle wrestles with the question of suicide (Droge 1988).

> For me, to live is Christ and to die is gain. Yet which *I shall choose* I cannot tell. I am hard pressed between the two. My strong desire is to depart and be with Christ, for that is far better. But to remain in the flesh is more necessary on your account. Convinced of this, I know that I shall remain and continue with you all, for your progress and joy in the faith, so that in me you may have ample cause to glory in Christ Jesus, because of my coming to you again.

The preceding passage concludes a section of the letter (1:12–26) in which Paul considers the relationship between his imprisonment and the proclamation of the Gospel. In the final analysis he declares that the Gospel will be better served by his continued existence rather than by his departure in death. But first he carefully considers the advantages of each possibility. As Lightfoot and other commentators have observed, "the grammar of the passage reflects the conflict of feeling in the apostle's mind. He is tossed to and fro between the desire to labour for Christ in life, and the desire to be united with Christ by death" (1891:92). Although the former possibility is judged to be "more necessary" (Gk *anangkaioteron* [Phil 1:24]), the latter is, literally, "much more better" (*pollō mallon kreisson* [v 23]).

At the outset it is important to note that Paul's reflections on death do not arise from the fact that he faces imminent execution. Admittedly, he is in prison, but by the time he writes his letter to the church at Philippi Paul has every reason to expect that he will receive a favorable verdict (1:25–26). That is why he can say to the Philippians that he is looking forward to visiting them in the near future (2:24). Furthermore, full weight must be given to Paul's statement about life and death: "which *I shall choose* I cannot tell" (1:22). In other words, the question of life or death is a matter of Paul's *own* volition, not a fate to be imposed on him by others. If it is a matter of Paul's own choosing, then it seems clear that his internal struggle concerns the possibility of suicide.

In Phil 1:21, Paul issues his famous statement about the meaning and significance he attaches to life and death: "For me, to live is Christ and to die is gain." Why is death a gain? The answer is found in 1:23, "My strong desire *(epithymia)* is to depart and be with Christ, for that is far better." For Paul, death is a gain because it means union with Christ and the attainment of immortality; and it is for this reason that he "lusts after death" (*epithymia eis to analysai,* cf. Seneca's *libido moriendi* in *Ep.* 24.25). Although he finally rejects the "gain" of death, it is clearly death that he prefers. This is confirmed by a similar statement in 2 Cor 5:1–8.

> For we know that if the earthly tent we live in is destroyed, we have a building from God, a house not made with hands, eternal in the heavens. Here indeed we groan, and long to put on our heavenly dwelling … For while we are in this tent, we sigh with anxiety; not that we would be unclothed, but that we would be further clothed, so that what is mortal may be swallowed up by life … So we are always of good courage; we know that while we are at home in the body we are away from the Lord … We are of good courage, *and we would rather be away from the body and at home with the Lord.*

The final sentence is important, for the phrase "we would rather …" *(eudokoumen mallon)* does not express a preference but a *decisive* choice.

If Paul prefers death, why does he finally choose life instead? Here attention must be given to the comparative *anangkaioteron* ("more necessary") in Phil 1:24. Earlier it was noted that Socrates had left a single loophole for the justification of voluntary death: "An individual must not kill himself until God

sends some necessity *(anangkē)* upon him" (*Phaedo* 62c). It seems that Paul, like so many of his contemporaries, was aware of this Socratic principle and applied to his own situation, for he says, "To remain in the flesh is *more necessary* on your account." In other words, he believed that the necessity or constraint was on the side of his remaining alive. While the option of death was considered and, indeed, personally desirable, it was ultimately rejected because it contravened his understanding of the *present* will of God, namely, that Paul continue his earthly mission. It is not the case, however, that Paul rejected suicide *per se,* only that it was not *yet* the appropriate time for such an act (In fact, it is not known how Paul died. Given his statements in Phil 1:23 and 2 Cor 5:8, the possibility of suicide cannot be ruled out.)

A similar position on voluntary death was endorsed by Paul's contemporary, the Roman Stoic Musonius Rufus, in a statement that can be read as a virtual paraphrase of Phil 1:21–26. "One who by living is of use to many," Musonius declares, "has not the right to choose to die, unless by dying he may be of use to more" (frag. 29; Lutz 1947:133). This is the intellectual context in which Paul's reflections on death are best understood. He prefers death to life because it means union with Christ and immortality, but Paul also believes that a divine *anangke* has been placed upon him and that he cannot depart until a divine signal is given.

D. Suicide in Second-Temple Judaism

In Jewish literature of the Hellenistic and Roman periods pious Jews are often portrayed as taking their lives voluntarily rather than betray their religious beliefs. For example, when in 39 or 40 A.D. the emperor Gaius announced plans to have a statue of himself erected in the Jerusalem temple, the Jews solemnly warned the Roman governor Petronius that, if this were carried out, they would first slaughter their women and children and then kill themselves "in contempt of a life which is not a life" (Philo *Gaium* 236).

Of similar interest is the treatment of voluntary death in the writings of Flavius Josephus. Although Josephus himself delivered a lengthy speech on the iniquity of suicide in the *Jewish War* (3 §362–82; but his own neck was on the line), in the same work he also praised the heroism of the Jews at Masada who mutually slaughtered themselves rather than fall into the hands of the Romans (7 §320–88). The former passage is especially worthy of note because it betrays a clear awareness of the Socratic tradition on suicide. "Do you not think that God is indignant," Josephus declares, "when man treats his gift with scorn? For it is from him that we have received our being, and it is to him that we should leave the decision to take it away" (*JW* 3 §371).

The most famous example of all, however, was the suicide of Razis, recorded in gruesome detail in 2 Macc 14:37–46.

> Being surrounded, Razis fell on his own sword, preferring to die nobly rather than to fall into the hands of sinners and suffer outrages unworthy of his noble birth. But in the heat of the struggle he did not hit exactly, and the crowd was now rushing in through the doors. He bravely ran up on the wall and manfully threw himself down into the crowd. But as they quickly drew back, a space opened and he fell in the middle of the empty space. Still alive and aflame with anger, he rose, and though his blood gushed forth and his wounds were severe he ran through the crowd; and standing on a steep rock, with his blood now completely drained from him, he tore out his entrails, took them with both hands and hurled them at the crowd, calling upon the Lord of life and spirit to give them back to him again.

The *theatrical* quality of Razis' death is of a piece with the literary commonplace of the Gymnosophists (Brahmans), who threw themselves into the fire and thereby made a protest against Alexander the Great, and with the stories in Tacitus of the Stoic philosophers who opened their veins in opposition to the emperor Nero. Also similar is the explicit hope of immortality: Razis "tore out his entrails, … calling upon the Lord of life and spirit to give them back to him again." His act of self-destruction is one of political rebellion, to be sure: but it is also carried out with the full assurance that he will pass over to a higher reality.

In later rabbinic literature there are numerous stories of suicide, and this despite the usual claim by scholars that the rabbis opposed the practice. The Mishnah and Talmud contain accounts of suicide and martyrdom as well as discussions relating to the rules and regulations governing both. For example, *b.*

Ketub. 103b relates that when rabbi Judah the Prince died a "voice from heaven" *(bat qôl)* proclaimed that all those present at his death would enjoy the life of the world to come. When a fuller, who had the misfortune of not calling on the rabbi that day, learned of this, he killed himself. Immediately, a *bat qôl* announced that he too would live in the world to come.

A similar story in the Mishnah *(ʿAbod. Zar.* 18a) concerns the martyrdom of Rabbi Hanina ben Teradion during the emperor Hadrian's reign. The rabbi was wrapped in a Torah scroll and set on fire; but to ensure that he would suffer, water-soaked tufts of wool were placed upon his heart. His disciples therefore begged him to breathe in the fire in order to hasten an otherwise gruesome death. The rabbi, however, refused, in words faintly reminiscent of the *Phaedo:* "Let him who gave [my soul] take it away, but no one should destroy himself." The executioner then asked whether he would enter the world to come if he helped the rabbi die sooner. When he received an affirmative response, the executioner removed the tufts of wool and the rabbi died. The executioner then threw himself upon the fire. Suddenly a *bat qôl* proclaimed that both the rabbi *and* the executioner had been admitted to the world to come. The story concludes: "One may acquire life in a single hour, another after many years."

In both accounts suicide is given a clearly positive valuation. Moreover, suicide is understood here not so much as an escape from mundane affairs and troubles; rather, it is an act of sincere contrition and simultaneous transformation, enabling the individual to atone for his sins and to attain eternal life. The statement that "one may acquire life in a single hour, another after many years" bespeaks an understanding of suicide not as a sin but as a particularly ennobling act: both Jew *and* pagan can be transformed by a well-judged and appropriate death.

E. Suicide in Early Christianity

As Christianity expanded into and eventually took over the Greek and Roman world it brought with it a preoccupation with death as intense as Paul's. "We conquer by dying," Tertullian wrote, "and this victory of ours gives us the spoil of eternal life" *(Apol. 50).* The Christians' lust for martyrdom was the measure of their value of life. For them "life itself was at best unimportant; at worst, evil. Death therefore was a release awaited or sought out with impatience" (Alvarez 1970:68). One thinks immediately of Ignatius begging the Roman community not to make any attempt to save him.

> I am writing to all the churches, and I give injunctions to all men, that I am dying willingly for God's sake, if you do not hinder it. I beseech you, be not an unseasonable kindness to me. Permit me to be eaten by the beasts, through whom I can attain to God … I long for the beasts that are prepared for me; and I pray that they may be found prompt for me. I will even entice them to devour me promptly; … I will force them to it. Grant me this favor. I know what is expedient for me; now I am becoming a disciple … Let there come on me fire, and cross, and struggles with wild beasts, cutting, and tearing asunder, racking of bones, mangling of limbs, crushing of my whole body, cruel tortures of the devil, may I but attain to Jesus Christ! … The pains of birth are upon me. Permit me, my brethren; hinder me not from living, do not wish me to die … Permit me to receive the pure light; when I have arrived there I shall become a man … Even though when I come to you I beg you myself, do not be persuaded by me, but rather obey this which I write to you. For in the midst of life I write to you desiring death (*Rom.* 4–7).

The Romans seem not to have been prepared for the fact that Christians like Ignatius anxiously awaited their torture as a means of salvation. In times of persecution Christians would force themselves on the notice of Roman magistrates by tearing down images and by other provocative demonstrations. In 185 A.D., the proconsul of Asia, Arrius Antoninus, was confronted by a group of Christians (perhaps Montanists) wearing nooses around their necks, and demanding execution. He simply sent them on their way, telling them that if they wanted to commit suicide there were cliffs and precipices they could jump over (Frend 1965:293). In similar fashion Marcus Aurelius says:

> What a fine thing is the soul which is ready if it must here and now be freed from the body and either extinguished or scattered or survive. But let this readiness come from a personal judgment and not out of a mere spirit of opposition, like that of the Christians. Let it be in a reasoned and grave temper, capable of convincing another, and without theatrics (*Meditations* 11.3).

Even certain Christians could be moved to embarrassment and irritation by such strident behavior. Clement of Alexandria, for example, criticizes those Christians whose fascination with martyrdom led to theatrical displays.

> We ourselves blame those who have rushed on death: for there are some who are really not ours but share only the name, who are eager to deliver themselves over in hatred against the creator, poor wretches, passionate for death. We say that these men commit suicide [*exagein heautous*] and are not really martyrs, even if they are officially executed. For they do not preserve the characteristic mark of believing martyrdom, inasmuch as they have not known the only true God, but give themselves up to vain death, as the Gymnosophists of the Brahmans to useless fire (*Strom.* 4.17.1).

Of interest here is Clement's contrast between martyrdom and suicide. In the final analysis such a distinction is rather arbitrary and depends to a large extent on the perspective of the observer. After all, Clement is describing the actions of men he considers heretics, "those who are not really ours but share only the name." Doubtless, Clement would also have regarded Ignatius' lust for martyrdom as suicidal, even though Ignatius himself viewed his impending death as the means of attaining immortality. The same ambiguity applies to the deaths of Socrates and Jesus. Depending therefore on the prejudice of the observer, the act of taking one's life or allowing it to be taken can be evaluated either positively, as a form of voluntary martyrdom or self-sacrifice, or negatively, as the equivalent of self-murder.

The ambiguous and fluid nature of the terms "suicide" and "martyrdom" is perhaps best illustrated by an extraordinary passage from the late 2d century *Martyrdom of Perpetua and Felicitas.* Condemned to death for refusing to deny their religious beliefs, these two women, along with other Christians, were led into an amphitheater where frightening tortures awaited them. Throughout, emphasis is placed on the voluntary nature of their suffering. "We came to this of our own accord," they declare, "that our freedom should not be violated" (18.5). Perpetua's death is then described in the following manner:

> The others took the sword in silence without moving, especially Saturnus, who... was the first to die. Perpetua, however, had yet to taste more pain. She screamed as she was struck on the bone; then she took the trembling hand of the young gladiator and guided it to her throat. It was as though so great a woman... could not be killed unless she herself was willing (21.8–10).

Here the concepts of suicide and martyrdom merge: they are but two sides of the same coin. In spite of its legendary features, this account brings to light an important aspect of one form of religious suicide in antiquity. Perpetua's death is not simply an attempt to escape from the trials and hardships of her present life, it is rather a statement about or judgment on life itself, both here and in the hereafter. That the dates of the deaths of the martyrs were celebrated annually in the church calendar as "birthdays" speaks volumes.

F. The Augustinian Reversal

In considering this cluster—martyrdom, suicide, murder—Jacques Bels (1975) has shown that up until the time of Augustine antiquity generally considered suicide as a form of voluntary martyrdom and clearly distinguished it from murder. Beginning with Augustine, however, the division was altered. Suicide came to be separated from martyrdom and identified instead with murder, more specifically, self-murder. Bels has further shown that the reasons for this change in attitude were largely polemical. In confrontation with the Donatists, Augustine sought to redefine the terms "martyrdom" and "suicide," and in so doing claimed, in a manner similar to Clement two centuries earlier, that the Donatist "martyrs" were in fact merely "suicides"—that is to say, self-murderers. (The relevant texts are *Against Gaudentius* [a Donatis bishop] and *City of God* 1.17–27. Though purely polemical in the former treatise, Augustine's opposition becomes more theoretical in the latter, when the Donatists appealed to the "Old Testament" example of Razis in order to justify their position.)

As is well known, Augustine's case against suicide was based on Plato, not the Bible. Aside from his appeal to the sixth commandment, "Thou shalt not kill," Augustine took over the Pythagorean argument of Plato in the *Phaedo,* that to sever the bonds of body and soul prematurely is to usurp a privilege which belongs only to God. To commit suicide therefore meant that the individual had acted, in his last moment of life, in direct opposition to the divine will—had, in a strict sense, murdered himself. However "un-

Christian" the sources of his argument, in the centuries between Augustine and the Renaissance suicide was condemned by Christianity as an act of murder and was considered unredeemable along with the sins of adultery and apostasy. Indeed, Aquinas buttressed the argument by raising self-preservation to the status of a universal natural law. Thus in the early 13th century, when the Albigensians sought out martyrdom with a Donatist zeal, the church condemned them for this and their *other* heresies, and then granted them their wish (Fedden 1972:146–47). For further discussion see *EncRel* 14:125–31.

SUKKOTH [Heb *sūkkôt* (סֻכּוֹת)]. The Feast of Succoth is equal to the Feast of Booths. See CALENDARS (ANCIENT ISRAELITE AND EARLY JEWISH).

SUMER, SUMERIANS. Sumerians were speakers of the Sumerian language. The Sumerian language is first attested in the earliest written records at the beginning of the 3d millennium B.C., and became extinct by the early 2d millennium, at the latest (Cooper 1973, Heimpel 1974, Lieberman 1977:20–21), but preserved as a language of scholarship and cult through the end of the pre-Christian era. See LANGUAGES (INTRODUCTORY SURVEY).

Sumer (ian) is the anglicized Akk *šumeru.* The term and the language were first known from the Sumero-Akkadian bilingual compositions and lexical lists found on tablets from Ashurbanipal's library at Nineveh, excavated in the middle of the 19th century. Controversy as to whether Sumerian was a real language or only an invented sacred language of the Babylonian and Assyrian clergy (Jones 1969) was resolved in the last decades of that century when large numbers of unilingual Sumerian texts and inscriptions of the Sumerians themselves were discovered during the French excavations at Girsu (Tello) and the American excavations at Nippur.

A. Usage and Etymology

The Sumerian term for Sumer is KI-EN-GI (R), and for the language EME-GI_7(R). Current scholarship has rejected the theory put forward by Poebel and elaborated by Jacobsen, which would link both KI-EN-GI and *šumeru* to the Sum word KALAM (Emesal dialect KA-NA-ÁG) "nation, homeland," and derive all from variant forms of the name of the city Nippur, the religious capital of ancient Babylonia (Krecher 1966:108, Kraus 1970:48–51). The adjective GI_7(R) means "noble" or the like and has a known variant orthography GI (R), as in the royal name Shulgi (r), "noble young man." Sum EME is "tongue," hence EME-GI_7 is "noble tongue," and the GI (R) in KI-EN-GI should function adjectivally like the GI_7(R) in EME-GI_7. Since Sum KI is "place," one would ideally like KI-EN-GI to be "noble place," but since the /g/ in GI_7 is not the nasalized Sum /ĝ/, this leaves the EN unexplained. The best suggestion is Wilcke's (1974:229–30),

that by analogy with known forms KI+toponym = "place GN" (attributive, not genetive), ki-en-gi be understood as "place, noble en." Sum EN normally means "lord" or "high priest," but the meaning intended when the term KI-EN-GI was coined (mid-3d millennium at the latest) is uncertain. The etymology of Akk *šumeru* and its relationship to KI-EN-GI and EME-GI_7 are unknown.

As a geographical term, KI-EN-GI "Sumer" is used in a narrow sense for Babylonia S of Nippur, and in this sense can contrast with KI-URI "Akkad," Babylonia N of Nippur. In a broader sense it is used for all of Babylonia, parallel to MA-DA "land", KALAM "nation," UN and SAG-GI^6-GA, both " (native) people," and in contrast to KUR (-KUR) "foreign land(s)" or specific extra-Babylonian toponyms.

As attributives, KI-EN-GI and EME-GI are used to qualify domestic animals in the Ur III period (Wilcke 1974:218–19), and there is a "Sumerian" (EME-GI_7) quart measure in the Sargonic period, but the terms rarely qualify human beings. One Sargonic administrative text possibly refers to "Akkadians" (LÚ A URI$^?$-ME) alongside Sumerians, and Shulgi of Ur (ca. 2050 B.C.) is said to have referred to his predecessors as Akkadians (DUMU URI), Sumerians (DUMU KI-EN-GI), and Gutians (Wilcke 1974:205, 216, 225–26). When the last king of Ur, Ibbisin (ca. 2000 B.C.) is said to have called his rival, Ishbi'erra, "not of Sumerian seed" (NUMUN KI-EN-GI NU-ME-A), it is because he comes from Mari, i.e. outside of Babylonia proper. In humorous scribal dialogues of the early 2d millennium, scribes boast of their "Sumerian" origins to bolster their claim to mastery of the Sumerian language, already a dead language that had to be learned in long years of study in the scribal academy (Wilcke 1974:226).

The term DUMU-$GI_{(7)}$(R) contains the same $GI_{(7)}$(R) as in KI-EN-GI (R) and EME-GI_7(R) and should mean "Sumerian" (DUMU = "child," and by extension, "citizen, member"), but in nearly all references seems to refer to either a fully free citizen, or an aristocrat, with no ethnic implications (Wilcke 1974:230; Cooper 1983:240).

B. Sumerian Origins

The vexing question of Sumerian origins has two parts: when did the Sumerians arrive in Mesopotamia, and whence? Most scholars accept the fact that a good number of the earliest place names in Babylonia are not Sumerian (but see, to the contrary, *CAH* 1/1:122–55; Jacobsen 1969), and therefore the early populations who named those places did not speak Sumerian (e.g., Gelb 1960). Based on perceived phonetic similarities, Landsberger (1974) associated a subgroup of these early place names with certain Sumerian words, dealing primarily with agriculture and crafts, which he saw as loanwords from the pre-Sumerian language of the place names, called by him Proto-Euphratic. Proto-Euphratic was, according to Landsberger, the language of the indigenous population of Babylonia, as distinct from the language of northern Mesopotamian, Proto-Tigridian, postulated on the basis of phonetic similarities in another subgroup of non-Sumerian, non-Semitic toponyms. Both Proto-Euphratic and Proto-Tigridian were themselves dialects of an original proto-language (*Ursprache;* Landsberger 1974:178 n. 2). Whether one accepts the notion of a Proto-Euphratic substratum in Sumerian or not (see the criticisms, e.g., of Powell 1972:167–68 and Lieberman 1977:18), the evidence of the non-Sumerian toponyms would make it quite difficult to posit the Sumerians as *the* indigenous population of (southern) Babylonia.

A *terminus ante quem* for Sumerian presence in Babylonia can be established by the date of the earliest texts in the Sumerian language. A respectable scholarly minority had always doubted that the Sumerians invented the writing system that bears their name (Gelb 1960:262–63, Oppenheim 1964:49, Hallo and Simpson 1971:22–23), but newly published evidence of the archaic texts from Uruk (Green and Nissen 1987) makes it highly unlikely that the earliest archaic texts (Nissen's Stage IV; Nissen 1986, Green and Nissen 1987) do not represent the Sumerian language, despite Nissen's own doubts (Green and Nissen 1987:Einleitung). The phonetic uses of archaic signs documented in Green and Nissen (1987) prove that the signs represent Sumerian lexemes. For example, the alternation of the signs TAB and DAB_5 proves that the signs in question had Sumerian readings already at the time of the archaic texts, and the use of the sign EN in composing the complex sign MEN "crown" shows that the language of the archaic texts had a word "crown" containing the phonetic sequence /en/, i.e., the Sum word MEN. Vaiman (1976) has made a convincing suggestion that the sign GI was used to represent "to return" or something similar, a word written with the sign GI_4 in later Sumerian. Since the sign GI is a pictogram of a reed, the language

represented would have to be one in which a reed could be used as a rebus writing for the verb "to return," i.e., "reed" and "to return" would have to be homonyms, as they are in Sumerian. The weight of the cumulative evidence is persuasive: the language of the archaic texts is Sumerian. Until the publication of the archaic texts has advanced further, it will be difficult to determine to what degree the evidence for the Sumerian character of the texts' language is present at the earliest stage (Nissen's Stage IV) as opposed to the next stage (Nissen's Stage III), to which the great majority of texts belongs. Chronologically, the difference is slight (just before 3000 B.C. or just after), and we can set the *terminus ante quem* for a Sumerian presence in Babylonia to 3100–3000 B.C.

Classically, attempts to detect the first presence of the Sumerians in prehistoric Babylonia have been made by searching the archaeological record for discontinuities that could indicate the arrival of a new population group. The premises of such an enterprise are questionable, and the results have been contradictory. There have been those who have seen continuity in the archaeological record and would have the Sumerians in Babylonia in the 5th millennium B.C., and those who see discontinuity and date the arrival of the Sumerians to the beginning of the Uruk period (mid-4th millennium) or later (Jones 1969; Römer 1985:7). Current consensus would deny the possibility of detecting ethno-linguistic change through change in archaeological assemblages or settlement patterns, but there continue to be archaeologists who are convinced that the Sumerians were present in the Ubaid population (5th millennium B.C.; e.g., Oates 1986:21–22), and those who are most comfortable placing the arrival of the Sumerians in the mid-4th millennium (Nissen 1988:68–69).

If the Sumerians were not part of the original population of Babylonia, where did they originate? Or, if they were part of the original population, where did their ancestors reside before the relatively late settlement of the Mesopotamian alluvium? Sumerian is a linguistic isolate, and the many attempts to relate it to other languages, ancient or modern, have been unsuccessful (Haldar 1965; Komoróczy 1978:226 with notes; Römer 1985:27–8). Because the ancient world to the W of Mesopotamia is relatively well known, and there is no evidence from toponyms, personal names or inscriptions to suggest early Sumerian presence there, the search for a Sumerian "homeland" has been to the north or east, and the Indus Valley area has been the most respectable specific suggestion (e.g., Römer 1985:9). Because Sumerian sources usually mention the Indus region (Meluhha) together with Magan and Dilmun in the Persian Gulf region (Heimpel 1987), and because of a Babylonian tradition, preserved by Berossus, that the merman sage Oannes rose out of the Gulf to bring the arts of civilization to Babylonia, it is most often suggested that the Sumerians arrived by sea or along the Gulf shore (but, to the contrary, von Soden 1985:15). The Gulf connection has also been used recently to suggest that the Sumerians originally inhabited areas now covered by the waters of the Gulf, which had advanced beyond Qatar only around 12,000 B.C., and didn't reach their present level until 4000 B.C. (Roux 1982). Possible support for the Indus Valley as a Sumerian homeland is the Sumerian poetic term for native Babylonians or mankind in general, SAG GI_6-GA "black-headed."

However, the most sensible approach to the problem of Sumerian origins is to abandon both the attempts to detect something in the archaeological record that signals their presence or arrival, and the search for an original homeland. A very sober and refreshing assessment of the problem by Komoróczy (1978) points out that *all* non-Indo-European, non-Semitic languages of the ANE are isolates, and that it was typical for very different languages to coexist and form convergence groups, as did Sumerian and Akkadian. He would see both Semites and Sumerians among the peoples who first settled the alluvium. The ancestors of the Sumerians may have originated on the eastern fringes of Babylonia, but all of the qualities that we might want to call "Sumerian" emerged and developed only after they were settled in Babylonia and in close contact with other ethno-linguistic groups. Similar views, conceptualizing Sumer and Sumerians as an evolving process within Babylonia have been expressed by, for example, Haldar (1965), Gibson (1976), Roux (1982) and Oates (1986). On current evidence, it is the best view, but new evidence could easily tilt the question toward quite different answers (Jones 1969:139–40).

C. Sumer in the Hebrew Bible

It has been generally accepted that OT Shinar, used for Babylonia, derives from Akk *šumeru.* See SHINAR. This etymology has been challenged by Zadok (1984), who suggests, rather, that Shinar derives from *šanḫar (r)a,* a word used for Babylonia in 14th-century B.C. Hittite and Syrian sources, deriving, perhaps, from the name of a Kassite tribe. The toponym appears in Egyptian sources as *sngr*.

Zadok argues that phonologically Shinar/*šanḫar (r)a*/*sngr* cannot derive from *šumeru,* and that furthermore, the term only appears in the second half of the 2d millennium B.C., long after the Sumerians had disappeared. The argument holds only if one insists that the biblical Shinar derives in the first instance from *šanḫar (r)a,* which could then be shown *not* to derive from *šumeru.* But if Shinar derives more directly from *šumeru* (the term was preserved and understood in cuneiform tradition throughout the 1st millennium B.C.), then Zadok's phonological objections are not compelling. One might well ask why the biblical authors would choose to designate Babylonia by a name known primarily from 14th-century Hittite texts.

JERROLD S. COOPER

SUMERIAN LITERATURE. Cuneiform texts in the Sumerian language which were edited in the scribal schools of ancient Mesopotamia and the surrounding Near East, with the exception of lexical lists, mathematical exercises, and other purely scholastic genres. Together, the literary and scholastic genres constitute the "canonical" category of Sumerian texts, and are distinguished from the sometimes equally eloquent monumental category (including law "codes") on the one hand and from the far more abundant archival category on the other.

A. Scope and Language
B. Genres First Attested in the Old Sumerian Phase
C. Genres Presumably Originating in the Neo-Sumerian Phase
D. Genres First Attested in the Old Babylonian Phase
E. The Post-Sumerian Phase

———

A. Scope and Language

Sumerian literature is comparable in sheer size to biblical literature. A recent survey estimates the number of lines so far recovered at approximately 40,000; bearing in mind that most Sumerian literature is poetic in form and that the typical Sumerian verse may be somewhat shorter than the typical biblical verse, this already compares favorably with the total of biblical verses in the Masoretic count, recently calculated at 23,097 (Hallo 1988). Much of Sumerian literature still remains to be recovered.

Most of Sumerian literature is composed in the main dialect (Sum *eme-gir*$_{15}$) but lamentations recited by certain types of singers and the speeches of women or goddesses in myths and erotic poetry are in a different dialect (Sum *eme-sal*). This dialect becomes more and more prevalent in the liturgical compositions of the post-Sumerian periods.

The modern rediscovery of Sumerian literature has passed through several stages, each reflected in contemporary biblical scholarship. The first stage began in 1873, with the first full editions of substantial numbers of bilingual Sumero-Akkadian texts by François Lenormant (1873–79). Such texts, mostly of late (i.e., 1st millennium B.C.) date, translated each Sumerian line literally into Akkadian. Consisting largely of religious poetry, they had particular influence on Psalms research. The second stage dates from about 65 years later, when S. N. Kramer (1937), A. Falkenstein (1938), and T. Jacobsen (1939) began to edit unilingual Sumerian literary compositions dating from the early 2d millennium B.C. These included many different genres and influenced the study of corresponding biblical genres, including historiography, narrative, love poetry, and proverbs. A third stage may be said to have begun a century after Lenormant with the publication by R. D. Biggs (1974) of the texts from Tell Abu Salabikh. Together with texts previously known from Šuruppak and other southern sites, and texts subsequently discovered at Ebla in Syria, the Abu Salabikh texts expanded the chronological horizon of Sumerian literature back almost to the beginnings of writing. The significance of these early Sumerian texts for biblical scholarship remains to be seen.

Given the chronological extent and generic diversity of the corpus, each genre will here be considered in the approximate order in which it first appeared in the corpus. Within each phase, the genres will be treated by focus, which is typically god, king, or (common) man, though some few genres focus on two or all three. (For a general attempt at the history of the corpus, see Hallo 1976; for a detailed typology and bibliography, see Edzard *RLA* 7:35–48; for biblical analogies, see Hallo 1988.)

B. Genres First Attested in the Old Sumerian Phase (ca. 2500–2200 B.C.)

Incantations are already attested at Šuruppak (modern Fara) and Ebla (Krebernik 1984) and continue to occur on individual tablets throughout the Old and Neo-Sumerian phases (e.g., Hallo 1985; Jacobsen 1985; Michalowski 1985). By Old Babylonian times, some were being collected and grouped by subject, e.g., those against "evil spirits" (Geller 1985). In post-Sumerian times, they were often provided with interlinear translations into Akkadian and generally served to ward off the evils feared from hostile magic or from unfavorable omens. Biblical literature has no comparable genres, preferring to deal with such ominous symptoms by the Levitical laws of purification. But the incantation bowls of the 6th century A.D. show that post-biblical Judaism was not immune to the approach in a Mesopotamian environment.

Hymns to deities and their temples are also attested from a very early date. Some of the finest are attributed to Enheduanna, daughter of Sargon of Akkad and the first non-anonymous author in history (Hallo and van Dijk 1968; Kramer *ANET*, 573–83). Another high point is represented by the temple hymns of Gudea of Lagaš (Jacobsen 1987, part 7). Like other religious poetry, these genres are reflected in the biblical psalter.

Sumerian myths and epics are generically also hymns, but confine praise of their divine or royal protagonist to their concluding doxology, while the body of the poem is narrative in character. The great gods (Enlil, Enki) and goddesses (Ninhursag, Inanna) figure prominently in these myths (cf. Kramer 1937; *ANET*, 37–57), but so do lesser deities, especially those worshipped at the religious capital of Nippur, such as Ninurta (cf. Cooper 1978; van Dijk 1983; Jacobsen 1987, part 4). The epics concentrate on the legendary rulers of Uruk (biblical Erech):Enmerkar, Lugalbanda, and especially Gilgamesh (cf. Kramer *ANET*, 44–52; Jacobsen 1987, part 5). In bilingual form, or in Akkadian adaptations, some of these epics survived into the late periods; an Akkadian fragment of Gilgamesh was found at 14th c. (?) Megiddo, and virtual quotations from the epic have been identified in Ecclesiastes (Tigay 1982:165–67).

The common man is notably the focus of wisdom literature, so called in imitation of the biblical category though wisdom itself is not prominently mentioned, as it often is in Proverbs, Job, and Ecclesiastes. The earliest attested wisdom genres are instructions and proverbs. The former are attributed respectively to the divine Ninurta (Aro 1968) and to the king of the last antediluvian city, Šuruppak, the Sumerian Noah; both collections include much practical advice, especially about agriculture (Alster 1974; 1975). Proverbs are attested far more abundantly; by the early 2d millennium, 24 discrete collections can be identified and they survive, sometimes in bilingual form, into the late 1st millennium (Gordon 1959; Alster 1978). Though biblical proverbs are not directly related to the Sumerian collections as they are, demonstrably, to Egyptian ones, they often display a remarkable similarity of both form and substance, as for instance in the catalogue of divine abominations in Prov 6:16–19. Almost equally old is the minor wisdom genre of the riddle (Biggs 1973), called *ibilu* in Sumerian and *ḫittu* in Akkadian; the latter term is cognate with Hebrew *ḥîdā*.

C. Genres Presumably Originating in the Neo-Sumerian Phase (ca. 2200–1900 B.C.)

The deification of the Sumerian king during this phase led to a certain commingling of sacred and royal literature and to the emergence of several new genres responding to the new ideology. (Though known from later copies, their composition can be dated here on internal grounds.) The king was regarded at once as of divine and human parentage, the product of a physical union in which the royal partners "represented" deities, most often Dumuzi and Inanna or their Akkadian equivalents Tammuz (cf. Ezek 8:14) and Ishtar. An extensive body of poetry celebrated these "sacred marriage" rites and, together with more strictly secular love poetry addressed to the king or recited antiphonally by him and his bride, anticipated the Song of Songs in its explicit eroticism (Kramer *ANET*, 496, 637–45; 1969; Jacobsen 1987). Divine hymns now often concluded with a prayer for the reigning king, presumably for recitation in the temple. But the courtly ceremonial engendered a new genre of its own, the royal hymn, in which the chief events and achievements of the royal lifetime were celebrated in non-liturgical form (Kramer *ANET*, 583–86; Klein 1981).

True to their ambiguous status during this period, kings were both authors and recipients of petitionary prayers which took the form of letters. Such letter-prayers were addressed to them, or to "real" deities, by princesses, officials, and ordinary mortals, and thus provide a precedent of sorts for the "individual

laments" of the Psalter (Falkenstein 1938; Kramer *ANET*, 382; Hallo 1968; 1981). New "wisdom" genres also provided vehicles for describing individual concerns, albeit most often of aristocratic circles in Nippur. The setting is authentic for this period, though the details may be fictitious. Thus we have literary records of trials (e.g., Jacobsen 1959), a letter of Ludingira, "the man of God," to his mother at Nippur (Civil 1964; Cooper 1971), and two elegies by the same (?) Ludingira for his father and wife respectively, one described as an incantation (tu_6), the other as a "wailing" *(i-lu)* (Kramer 1960). But perhaps most startling is the "petition (*ír-ša-ne-ša*$_4$) to a man's personal god" in which an unnamed individual laments his fate until finally restored to health and fortune by his personal deity (Kramer 1955; *ANET*, 589–91). The parallels between this text and the archaic prose frame of Job are striking, and the gap between the two compositions is in some part bridged by Akkadian treatments of the same "righteous sufferer" theme, some of which have turned up in the scribal schools of 14th century B.C. Ugarit (Nougayrol 1968 no. 162).

D. Genres First Attested in the Old Babylonian Phase (ca. 1900–1600 B.C.)

The collapse of the Neo-Sumerian empire of Ur (ca. 2000 B.C.) and the decline of the dynasty of Isin which succeeded it (ca. 1900 B.C.) inspired new genres to address new problems. In sacred literature, the "congregational lament" mourned the destruction of cities and especially of temples at the hands of hostile forces, often conceived as aided or abetted by a disaffected patron deity. Such laments may have served a ritual purpose: when rebuilding the ruined temple, the necessary demolition of the remaining ruins could have been punished as sacrilege had not the blame been laid squarely on enemy shoulders. The laments over the temples of Ur, Eridu, Nippur, Uruk, and over Sumer as a whole were all quite specific in recalling the historical circumstances of the disasters (*ANET*, 455–63, 611–19; Jacobsen 1987, part 8). Later laments turned into ritualized litanies which, at ever greater length, appealed to the deity to desist from visiting further calamities on his or her worshippers (Cohen 1974; 1981); they form a bridge of sorts to the comparable genre in the Psalter and to Lamentations, though far inferior to both the biblical and the Old Babylonian compositions (Gwaltney 1983). The latter themselves may have evolved from earlier compositions commemorating the fall of Lagaš (Hirsch 1967) and Akkad (cf. Gen 10:10) (*ANET*, 646–51; Cooper 1983; Jacobsen 1987).

While priestly poets coped with the destruction of temples, royal historiographers wrestled with the ceaseless change of dynasties. The entire history of Sumer (and Akkad) was outlined in the Sumerian King List, a document which traced the succession of dynasties (or rather of cities) which had ruled the country from the end of the Flood to the accession of Hammurapi of Babylon (ca. 1792 B.C.) (Jacobsen 1939). Later recensions prefaced this outline with a version of antediluvian "history" probably borrowed from the Sumerian Flood Story (*ANET*, 42–44; Civil 1969; Jacobsen 1987:145–50). The outline history of the Hammurapi dynasty and all later Babylonian dynasties was similarly enshrined in corresponding Akkadian king lists. The Dynastic Chronicle combined both Sumerian and Babylonian traditions in bilingual format (Finkel 1980). A comparable history of Lagaš was composed, probably at the court of Old Babylonian Larsa, for both these cities were omitted from the "official" king lists emanating, most likely, from Nippur (Sollberger 1967). Sumerian historiography thus has little in common with the Deuteronomic history or the Chronicler's history of Israel, though it can be said to include other products of the royal chanceries such as royal correspondence, royal hymns, and royal inscriptions (Hallo 1983).

The Old Babylonian period witnessed the heyday of the scribal school (Sum *é-dub-ba-a*), in which Sumerian was taught to Akkadian-speaking pupils. The daily life of the school is vividly portrayed in essays about the school and in diatribes between teachers and students and among the students (Sjöberg 1976; Gadd 1956). Well trained in debate, the scribes devised a genre of literary disputations for royal entertainment or religious festivals. These pitted imaginary antagonists against each other—shepherd and farmer, summer and winter, cattle and grain, pickaxe and plow, silver and copper—with the winner proclaimed at the end by king or deity. A distant parallel may be seen in the biblical fables such as 2 Kgs 14:9 and Judg 9:8–15 or in the story of Cain and Abel (*ANET*, 41–42; Alster and Vanstiphout 1987).

E. The Post-Sumerian Phase (ca. 1600–100 B.C.)

The fall of Babylon (ca. 1600 B.C.) led to the closing of the scribal schools of Babylonia and relegated Sumerian firmly and finally to the status of a learned and liturgical language. Scribal guilds replaced the schools in Babylonia, and royal libraries like those of Assur and Nineveh took their place in Assyria. Here and in the temples, Sumerian texts continued to be catalogued, copied, recited, translated into Akkadian, and even newly composed. And with the growing prestige of Babylonian learning, they were carried beyond the borders of Mesopotamia to the capital cities surrounding it in a great arc—from Susa in the southeast to Hattuša in the north and Ugarit in the west. But the scope of the Sumerian literary heritage thus passed on gradually contracted. Of the genres devoted to the common man, only proverbs and school essays survived in bilingual editions; the rest largely disappeared while a rich Akkadian wisdom literature came into its own (Lambert 1960, esp. chap. 9). The genres devoted to the king were fundamentally altered by the new ideology, which rejected his deification; few of the epics and fewer still of the royal hymns and love songs escaped displacement or recasting in Akkadian guise. Only in the religious sphere did Sumerian continue to figure prominently. Here, a rich bilingual (and, on the periphery, even occasionally trilingual) literature continued to sing the praises of the gods or appeal for their mercy (e.g., Cooper 1971, 1972). More and more, this sacred literature employed the *emesal* dialect (Krecher 1967; Kutscher 1975). In bilingual and dialectal form, Sumerian literature survived and even revived as late as the Seleucid and Parthian periods in Babylonia (Black 1987; Cohen 1988). With a history of two-and-a-half millennia, with a geographic spread embracing most of the Asiatic Near East, and with a direct impact on Akkadian, Hurrian, and Hittite literature, Sumerian literature may well have exercised indirect influence on biblical literature. But where and when that influence made itself felt must be investigated separately for each genre.

SUN. In ancient Israel the sun—Heb *šemeš* (masc. though sometimes treated as fem.), less commonly *ḥeres* (Job 9:7; Isa 19:18 [emended text]) or *ḥamma* (lit. "the hot one")—was usually felt to be a positive phenomenon. "Light is sweet, and it is pleasant for the eyes to behold the sun" (Eccl 11:7). Night was the domain of unsavory characters (Job 38:13) and beasts of prey that hastened away as soon as the sun rose (Ps 104:22). The world "under the sun" was the proper realm of mankind (Eccl 1:3 and *passim*; cf. *KAI* 13.7–8; 24.12; 222 C 4–5). To "see the sun" filled people with a sense of being alive; the stillborn could be described as ones who had never had that experience (Ps 58:9; Eccl 6:5).

Being a symbol of life and vigor, the sun could be used as a metaphor to designate a person's vitality, happiness, and success. To have one's sun "go down" meant to experience misfortune and failure (Jer 15:9; cf. Mic 3:6). Another positive quality associated with the sun is constancy. The enduring fame one might wish for a king was like a reflection of the steady presence of the sun (Ps 72:17; cf. v 5). Because of its penetrating rays, from which nothing remains hidden (Ps 19:6), the sun also embodied the triumph of justice. At the break of day, "the wicked were shaken off the earth" (Job 38:13), as the "sun of righteousness" rose (Mal 3:20—Eng 4:2). Morning after morning, God passed judgment "like the light," as the *Tg. Jonathan* renders Zeph 3:5. In view of the sun's association with the distribution of justice, the righteous ruler could be compared to the morning light; he was "like the sun shining forth upon a cloudless morning" (2 Sam 23:3–4).

However, the sun also had its grim side. The Palestinian sun is hot (Exod 16:21); around noon it can be suffocating. This was the time when, according to popular belief, the midday demon haunted the land (Ps 91:6; cf. Vulg). When the sun had reached its zenith—the time referred to as the heat of the sun in 1 Sam 11:9; Neh 7:3—one had best doze off in the shade of one's home (Gen 18:1). Prolonged exposure to the sun could lead to sunstroke (Isa 49:10; Jonah 4:8; Ps 121:6; cf. 2 Kgs 4:18–20; Jdt 8:2–3). Those who could afford to do so led an indoor life; having a skin scorched by the sun designated one as a member of the lower classes (Cant 1:6).

The OT writings do not attest to an elaborate cosmology, shared by all Israelites. Thus, the data concerning the daily course of the sun do not inform us concerning its whereabouts overnight. In most ancient cosmologies, the sun was regarded as making its way from the west to the east through a

subterranean passage. *Tg. Ket.* Eccl 1:5 and Rashi suggest that this is indeed the conception underlying Eccl 1:5. The latter passage, however, gives no explicit cosmological view. Psalm 19:5–7 pictures the sun as coming out of a tent, like a groom from the nuptial chamber. Since in other texts the heavens are represented as a tent (e.g., Isa 40:22; Ps 104:2–3; Job 26:7), the psalmist is apparently suggesting that the sun spent the night in a heavenly abode. The "habitation" *(zĕbûl)* of sun and moon which Hab 3:11 refers to seems to be located in heaven, too. It would be vain, however, to search in the OT for one authoritative view on this matter. Ancient Egyptian iconography represents the sun as being daily brought forth and swallowed by Nut, the goddess of heaven, but also as making a journey through the underworld in his barque. This "multiplicity of approaches" (Frankfort and Frankfort 1946:10–26), proper to ancient Egyptian thought, is characteristic of the cosmological views of the Israelites, too. On the whole, the OT writers were less interested in establishing a unified cosmology, than in extolling God's power over the universe. Day will follow upon day, season upon season, because God has ordained it to be so. Yet in the day of judgment, the "Day of the Lord," even the sun will be ashamed (Isa 24:23). It will darken and no longer shed its light (Isa 13:10; Joel 2:10; 3:4—Eng 2:31; 4:15—Eng 3:15), to shine all the more clearly in the era of salvation to follow (Isa 30:26), if indeed it is not wholly eclipsed by God's own light (Isa 60:19–20; cf. Rev 21:23, 22:5). The Gospels underscore the dramatic importance of the Crucifixion with an account of the darkness that lasted for three hours, beginning at noon (Matt 27:45 = Mark 15:33; Luke 23:44).

Though they did not speak of the sun in exclusively mythical terms, the peoples of the ANE regarded the sun as a deity. In Egypt, the sun god (going by such names as Khepri, Re, Atum, Aton and Amon-Re, depending on local traditions and the various manifestations of the sun) was the most prominent deity. He was creator and judge, all-knowing and all-seeing. In Mesopotamia, Shamash (Sumerian Utu) was widely worshipped as the patron of justice, the god who protected the maltreated and downtrodden. Since he was thought to pass the night in the underworld, he could be asked to mediate between the living and the spirits of the dead. North-Syrian inscriptions from Zenjirli mention Shamash in one breath with Hadad, El-Reshep (or Arq-Reshep), and Rakib-El (*KAI* 214.2–3, 11, 18; 215.22). The Mesopotamian sun god is also invoked in the inscription of Zakkur (*KAI* 202 B 24), in the treaty of Barga›ya and Mati›el (*KAI* 222 A 9), and in a funerary stela from Nerab (*KAI* 225.9). In the Ugaritic pantheon there was a sun goddess called *Špš,* connected with the netherworld. She is called a ruler of the dead, and it was within her powers to liberate Baal from the realm of death. The female gender of Ugaritic *Špš* is matched by the South-Arabian goddess *Šams* (worshipped as a male deity, however, in Palmyra). Topographical names mentioned in the OT, such as Beth-shemesh (a pre-Israelite settlement), attest to the presence of a sun cult on the early Palestinian soil, too. If the restoration proposed by E. Puech (1986) for a 12th century B.C.E. inscription from Lachish is correct, there is also epigraphical evidence for a temple of *Šmš* in early Iron Age Palestine.

Considering the popularity of the solar cult in the ANE, its absence among the Israelites would be astonishing. The polemical references in Deut 4:19; 17:3; Jer 8:2 and Job 31:26–28 show that many Israelites were indeed attracted to the worship of the sun. According to 2 Kgs 23:11, the so-called "Josianic Reform" was equally directed against the cult of the sun. Modern authors who stress the political implications of Josiah's religious program have speculated about the Assyrian character of the 7th century solar cult in Jerusalem. Neo-Assyrian politics, however, did not, as a rule, stipulate allegiance to Assyrian deities from vassal states (Cogan 1974; cf. Spieckermann 1982:86–88; 236–56).

The cult of the sun was traditionally well established in Syria and Palestine, so there is no need to assume that it was a 7th-century innovation on the part of the Assyrian overlords. The only distinctively Assyrian trait one can discover in the narrative of 2 Kings 23 is the presence of horses and chariots dedicated to the sun (2 Kgs 23:11). Contrary to the assumption of many commentators, however, the custom of dedicating (model?) horses and chariots to the sun has little to do with the sun-god's alleged Akkadian title *rākib narkabti,* "charioteer." In fact, this was an epithet of Bunene, the trusted advisor of Shamash. Yet it is true that (white!) horses served important ritual functions in Assyria. The practice of

dedicating such animals to the sun, taken over by the Assyrians from the Mitanni, may have found its way into Judah by way of the Arameans.

The success of Josiah's efforts was short-lived. Shortly before the Babylonian Exile, Ezekiel witnessed a scene of priests worshipping the sun in the courtyard of the temple in Jerusalem (Ezek 8:16). And also after the Exile, sun worship remained one of the pagan cults most popular among Palestinian Jews, as extrabiblical sources attest. Eventually, the rabbis seem to have permitted the oath by the sun (cf. Maimonides, *Mishneh Tora, Seper Hafla›a, Shebu‹ot* xii 3, Philo. *Spec Leg* II 2).

The deification of the sun was severely combatted by the partisans of Yahwism. According to the priestly account of the creation, the sun is merely "the great luminary" made by God to rule the day (Gen 1:14–19; cf. Jer 31:35, Ps 74:16, 137:7–9). It is under the command of God, who may order it not to rise (Job 9:7), to stand still (Josh 10:12), or to move backward (2 Kgs 20:11; Isa 38:8). It would not be correct, however, to say that the sun was merely divested of its numinous character. Some of the traits formerly belonging to the deified sun were transferred to YHWH, who thus acquired a solar aspect. The story of the ark's stay in Beth-shemesh (1 Sam 6:7–21), judging by its name a center of sun worship, may have preserved the memory of how the Yahwistic cult supplanted the solar cult. In the course of this process, which has presumably been occurring on a larger scale, new characteristics were added to the image of the Lord. Although the God of Israel never came to be regarded as being immanent in the sun, he did take over the role of sun god. Thus various individual complaints in the Psalter mention the morning as the time of salvation. At dawn, the suppliants expect to behold God's face, in order to be released from their trials (Ps 11:7; 17:15; cf. Ps 30:6 [—Eng 30:5]; 46:6 [—Eng 46:5]). The theophany of which these texts speak might be connected with the early sunrise. As the sun breaks through, the reign of wickedness comes to an end. A Sumerian proverb says, "Let but the lawless exert themselves. Utu [i.e., the sun god] is the bringer of every day." In Israel, it is the Lord who with his eyes, like the all-penetrating rays of the sun, scrutinized everything and called the evildoers to do account (e.g., Psalm 19). On occasion, the Lord is said to "shine forth" (Heb *hôpîa‹* [Deut 33:2]), to "flash up" (*zrh* [Isa 60:2]), and to "shine" (*ngh* [2 Sam 22:29; Isa 4:5]), all verbs associated with the sun. According to Num 25:4, judgment is to be executed *neged haššemeš,* "before (RSV: in) the sun"; on the basis of 2 Sam 12:11–12 this expression is usually understood to mean "publicly," as opposed to "privately" *(bassēter).* Since 2 Sam 21:6, 9 speaks about an execution "before the Lord," however, one might take Num 25:4 as a reference to the judicial role of the sun, a role eventually devolved upon the Lord.

A number of scholars have suggested that the temple in Jerusalem was designed as a center of sun cult, in which the Lord was worshipped as a solar deity (e.g. F. J. Hollis, H. G. May, J. Morgenstern). The E-W orientation of the temple, for instance, would have been chosen to allow the morning rays of the sun to penetrate directly into the sanctuary. The pillars at the entrance of the building have been compared with the columns at the doorway of Egyptian solar temples; also the formula of dedication in 1 Kgs 8:12–13 (LXX) has been understood as an indication of the scholar character of the Jerusalem temple cult. Recent scholarship has cautioned against unwarranted speculation on this subject. Yet even the more reluctant authors concede that at least some solar elements were present in the Jerusalem temple. It is therefore not without good cause that the worshipper who claimed that one day in the temple courts is better than a thousand elsewhere could call his god "a sun *(šemeš)* and shield" (Ps 84:10–11).

These observations agree with the image of the Lord as a god who has taken on several solar traits. Foremost among the latter stands his role as divine judge. In Israel, the Lord fulfilled the role given to Shamash (Sumerian Utu) in Mesopotamia, and to Amon-Re in the Egyptian religion of the New Kingdom. Like the sun, he was thought to be all seeing and all knowing; he brought "hidden sins" to light (cf. Ps 19:13). His earthly abode, the temple in Jerusalem, was therefore also a center where justice was administered. Evildoers would be found out by God, and the unjustly accused would be acquitted, as several Psalms say, alluding to ordeal procedures (Psalms 3, 4, 5, 7, 11, 17, 26, 27, 57, 63, 73).

Iconographically, the sun god was often represented as a winged disk. This symbol was popular all over the ANE. Also the Palestinian soil has yielded several royal stamps, dating from the 8th and 7th centuries B.C.E. decorated with the winged disk. The archaeological evidence, therefore, suggests that in the

Israelite religion no ban was placed on the traditional solar symbol, in spite of its evident religious connotations. Was it taken as a reference to Israel's god? The link has certainly been made by Mal 3:20—Eng 4:2, where it is said that for those fearing God "the sun of righteousness shall rise, with healing in its wings." This text sums up, in a way, the religious significance attached to the sun and its subtle relation to the Lord. The winged sun, omnipresent and all seeing, is the bringer of justice; in Yahwism, it has been closely associated with the Lord, who accordingly has assumed several traits traditionally ascribed to solar deities.

KAREL VAN DER TOORN

SUN, CITY OF THE (PLACE) [Heb *ʿîr* (עִיר) *haḥeres* (הַחֶרֶס)]. This phrase (only in Isa 19:18) is the translation of a variant reading found in some Heb mss and accepted by most modern translations (including RSV, NAB, NEB, TEV, NJB). However, most copies of the MT read "the city of destruction" *(heres).* There is also some evidence that this reading may be a distortion of the original "city of the righteousness" *(ṣedeq),* which can be recovered from the LXX (*asedek*—not a Gk word, but simply Heb transliterated in Gk letters).

The passage in which the phrase occurs tells of five cities in Egypt whose inhabitants speak Hebrew and worship the God of Israel. It is not clear whether the speakers of Hebrew are Israelites or Egyptian proselytes. The latter part of the passage links Israel with Egypt and Assyria, its traditional enemies.

The passage, in its original wording, may have been written in exilic times when some Jerusalemites had fled to Egypt. The section thus expresses a hope for the establishment of a "new Jerusalem" (Jerusalem being the city in which righteousness [*ṣedeq*] lived [Isa 1:21]) in Egypt. The reading of most Heb texts (*heres,* "destruction") could well be a deliberate distortion of the proposed original term *(ṣedeq)* and a judgment against the Jewish people in Egypt who had built the temple in Leontopolis—an action which offended the Jerusalemite (and later rabbinic) authorities. The other Heb texts, the Qumran Isaiah scroll, Symmachus (Jewish Gk translation from the 2d century C.E.), and the Lat, all have "city of the sun." This reading seems to be a deliberate acceptance of the unconventional temple by recognizing the temple in Leontopolis. (Leontopolis was located in the nome [district] of HELIOPOLIS, "the City of the Sun.")

The phrase occurs in a passage justly famous for its striking universalism. The variations among the versions show that any translation, ancient or modern, involves interpretation.

SUPERSTITION. Superstition (Lat *superstitio;* Gk *deisidaimonia*) is the term which pagan writers and legislators favored as a depiction of Judaism and Christianity. From the age of Constantine onwards Christian writers and legislators returned the favor by referring to pagan religion as *superstitio* or

deisidaimonia. Cicero (*Flac.* 67), Valerius Maximus (*Facta et Dicta Memorabilia* 1.3.3), Horace (*Sat.* 2.3.281–95), and Plutarch (*De superst.* 8) represent a rhetorician, anthologist, philosopher, and educator, respectively, who considered Judaism a superstition. The court gossip Suetonius (*Ner.* 16.2) and the diplomat Pliny the Younger (*Ep.* 10.96.7.12) disparaged Christians (to the extent they could distinguish them from Jews) because Christians, they said, held to a superstition.

In their turn, Christian theologians and lawmakers called pagan and Jewish religion superstition (Acts 17:22 and 25:19). Tertullian (*Pallio* 4.10; *Ad Nat.* 2.8.8) mocks all pagan religion in the first text, the Egyptian cults in the second by calling both *superstitio.* The religion of the Goths, says Augustine (*De civ. D.* 10.9) is *superstitio,* as is the faith of the Jews (*De civ. D.* 6.11). Legislation from Constantine onwards includes Jews among the *superstitiosi* (Krueger and Mommsen 1895:844 = *Digesta* 50.2.3.3).

What did superstition mean in antiquity, apart from serving as a tidy label for someone else's religion? Can the history of early Christian literature be illumined by an understanding of the meaning and function of superstition in pagan antiquity? The answer to the first question requires a short survey of the intellectual and social history of *superstitio,* including its etymology, original meaning, and subsequent history. The answer to the second question stems from pagan antiquity's belief that Christianity's progress across large tracts of the Mediterranean world resembled nothing so much as the spread of a *vana superstitio,* a futile, even dangerous system of belief.

A. Intellectual and Social History

In the ancient world the usage of *superstitio* progressed through four stages. From Constantine (ca. mid-4th century) onwards it became the choice of Christian theologians and legislators for designating both pagan and Jewish religion. Prior to that, from Livy to Constantine (approximately the first three centuries C.E.), *superstitio* denoted a form of *religio,* "religion," either native or imported, that posed a threat to the stability of the state or to the fabric of family life. Still earlier, from Cicero to Livy (ca. 1st century B.C.E.) the term applied especially to exaggerated, even droll forms of piety and religion, especially as practiced by old men and women. From Plautus and Ennius to Cicero (ca. 2d century B.C.E.) *superstitio* meant either "prophetic" (Smith 1981:350), "the faculty of testifying retrospectively to what has been obliterated" (Benveniste 1973:516; Janssen 1975:141), unlawful divination (Grodzynski 1974:38), or "the ability to interpret cultic oracles" (Calderone *ANRW* 1/2:396). Because *superstitio* does not occur in the surviving Latin literature before Cicero, these attempts to discern its original meaning turn on texts in which the noun-adjective *superstes,* "witness" or "survivor," or the adjective *superstitiosus,* "possessing divinatory skills," appears (Ennius, *Scen.* 57; 319, Plaut. *Truc.* 387; *Asin.* 17; *Rud.* 1139; *Cas.* 818).

The ancients already disagreed among themselves over the etymology of *superstitio* (Pease 1977:580–81). The earliest surviving attempt to trace the word's origin comes from Cicero, who says that "superstition" defines the faith of people "who spend the whole day in prayer and sacrifice in order that their children may survive *(superstites)* them" (*Nat. D.* 2.72). This derivation of *superstitio* from *superstes* ("witness" or "survivor") has commanded growing assent from scholars (Benveniste 1973; Janssen 1975). *Superstes* became increasingly associated in Latin literature with a personal survival instinct that could cut across the grain of established canons of *fides,* "loyalty," *pietas,* "piety," and *humanitas,* "civilized behavior" (Janssen 1975:187). Its own history thus helps explain the similar degeneration of *superstitio* from an expression of positive religious meaning into a term of abuse.

With regard to the social history of *superstitio* the following points stand out. Within the exercise of piety and religion, *superstitio* included violations of the traditions governing the use of the *precatio,* the formula prayer, and the *carmen,* the metrical hymn. Both Plinys saw in the misuse of hymns and prayers the stuff which bred *superstitio* (Pliny the Elder, *H.N.* 30.2.7; Pliny the Younger, *Ep.* 10.96.8; cf. already Cicero, *Clu.* 194). The charge of *superstitio,* though without any formal legal basis, nonetheless entered into trials and police actions under the Julio-Claudian, Flavian, and Antonine emperors (Val. Max. *Facta et Dicta Memorabilia* 1.3; Quint. *Inst.* 4.4.5; Tac. *Ann.* 12.59). Although there is no surviving legislation against *superstitio* as such from the 1st century C.E., there are other laws and edicts that empowered magistrates and prefects to punish *Religionsfrevel,* "outrages against religion," especially if such outrages embraced deeds inimical to the state, addiction to magic, or caused injury to another person through

charms and chants. Mommsen (1890) was the first to point out the relevance of the *lex Iulia maiestatis,* the law punishing acts of treason, for correcting religious delicts. The *lex Cornelia de sicariis et veneficis,* a law punishing murder by dagger and poison, was extended by a decree of the senate (date unknown) to punish even the *pigmentarius,* "pharmacist," who sold hemlock, aconite, caterpillars, and blister beetles—all deadly ingredients in the kit of a potential murderer or sorcerer (Krueger and Mommsen 1895:802 = *Digest* 48.8.3). In the civil courts, where cases of personal injury, *iniuria,* appeared, precedents accumulated for extending the *iniuria* statutes to include injury arising out of verse, songs, and prayers whose intent was malevolent (Krueger and Mommsen 1895:780–81 = *Digest* 47.10.13.27). The application of the laws governing *iniuria* to superstition lies close at hand: Roman writers from Cicero to Pliny the Younger knew that *superstitiosi* achieved their goals, in part, through potent *carmina,* "sacred songs."

Two final points are germane to the general history of *superstitio* in pagan antiquity. First, *superstitio* is an aristocratic term of contempt for forms of religion and piety that Rome's literate upper classes found excessive, comic, or dangerous. How Rome's unlettered majority attacked forms of religion that were comic or threatening is uncertain, but it did reproach them. A piece of graffiti from the Paedigogium on Rome's Palatine hill dated to the reign of Septimius Severus (193–211 C.E.) illustrates this contention. The line drawing consists of a crucified man with a donkey's head before which an *orans,* a man in the prayer posture, is standing. See Fig. ART.48. The Greek text reads *Alexamenos sebete theon.* Despite certain grammatical difficulties, the scrawled line probably means "Alexamenos worships god" (Vaeaenaenen 1966 1:209–212). Naturally, it is tempting to interpret this graffito as a parody of Christian faith, corresponding at the visual level to what literate Romans called *superstitio.*

The second point is that the Greek word *deisidaimonia* "god-fearing" was frequently translated by *superstitio.* As *deisidaimonia* gradually evolved in classical and late antiquity into a term of reproach, signifying "excessive fear before the gods" (Koets 1929:104–6), it conduced to and even accelerated *superstitio*'s progression from an expression of positive religious content to a term of abuse (Smith 1975; 1981:352–55).

B. Early Christianity

The importance of *superstitio* for a fuller understanding of the history and literature of early Christianity stems from the fresh light that is thrown on texts and traditions. For example, the submission tradition in Rom 13:1–7, 1 Pet 2:13–17, and *1 Clem.* 61, though widespread in Hellenistic Jewish literature of the period, is nonetheless enigmatic. These texts come from letters written either from or to Rome. Each calls for submission to Roman civil authority. How to explain this appeal, coming as it does in an age of increased aversion among Romans to any form of religion thought to be a *superstitio* (Hodgson 1986:65)?

If the label or charge of *superstitio* is envisioned as a form of aggressive behavior adopted by Roman courts and police to suppress nonconformity in matters of public and private life, then the response to such charges (in Roman Christianity at least) may lie in texts like Rom 13:1–7. Seen from this perspective, Rom 13:1–7 is a short-term strategy for survival in an increasingly hostile city. The broader issues at stake are then the original rationale for, and long-term relevance of, all the submission traditions in early Christian literature (1 Pet 2:13–3:7; Col 3:18–4:1; Eph 5:22–6:9; *1 Clem.* 57; *Did* 4:11). Were these exhortations, initially at least, a clarion call to withdraw from ordinary life and to set up a counter-society (Elliot 1981)? Or were they a pragmatic strategy to brace early Christianity against calumny and arm it with established codes of behavior in order that it make its way *within* ancient society (Balch 1981)? If Rom 13:1–7 and the other related texts were short-term responses to the charge of *superstitio,* how did they evolve into timeless principles of moral action? The social and intellectual history of *superstitio* can help us find answers to these questions.

SUPH (PLACE) [Heb *šp* (שׁף)]. A place mentioned near the site of Moses' address to the people of Israel in Transjordan prior to their entry into the land of Canaan (Deut 1:1). Attempts to locate this biblical site have yielded little results. Musil (1907:211) suggested Kh. Sufah, ca. 7 km SE of Madaba, as a possible match (followed by Noth *NDH* 108–9). Due to the similarity in meaning, Kraeling (1948:201) identified the Greek town Papyron (cf. Gk *papyros*), mentioned by Josephus (*Ant* 14.33) in connection with a victory of the Hasmonean ruler Aristobolus, as the Greek equivalent of Heb *sûp* (lit. "reeds, rushes").

Others propose emending the text from *môl sûp* "in front of/opposite Suph" to *miyyām sûp* "from the Re (e)d Sea" (Cheyne in *EncBib* 4023–24; *BDB* 693; see discussion in Driver *Deuteronomy* ICC, 1–4 and Simons *GTTOT*, 255). This reading is also supported in some versions (LXX, Vg, and *Tg. Onq.*), which reflect an understanding of the Heb as *yam sûp.* If correct, this *yam sûp* may refer to the Gulf of Aqabah (cf. 1 Kgs 9:26 and Jer 49:21), although the precise geography of this verse as a whole is problematic. See also RED SEA.

SUPHAH (PLACE) [Heb *sûpâ* (סוּפָה)]. A name occurring in a quotation from "The Book of the Wars of Yahweh" (Num 21:14–15). Scholars have long noted the textual difficulties in these two verses of archaic poetry. Noth concluded that the poetic fragment "defies all explanation" (*Numbers* OTL, 160), while Albright felt that reconstruction was not possible (*YGC*, 44). The Sam. Pent. and Vg interpret Suphah as *yam sûp*, the "Re (e)d Sea" (note KJV "What he did in the Red Sea," which follows Vg *sicut fecit in mari Rubro*). The RSV's traditional "Waheb in Suphah" (Heb *ʾt whb b-swph*), a reference to two locations in Transjordan (note also Budd *Numbers* WBC, 237), has never been satisfactorily explained. Suphah may be related to the SUPH of Deut 1:1, but there is no evidence to support this equation.

Christensen (1974) has proposed reading Yahweh as the subject throughout the two verses: "[Yahweh] came in a whirlwind, he came to the branch wadis of the Arnon …" etc. (Heb *ʾt Yhw b-swph, ʾt nḥly-m ʾrnwn*). In this reading, the Heb particle *ʾt* is taken as the verb *ʾth* "to come" (found only in poetry, e.g., Deut 33:2); *whb* is read as the tetragrammaton *Yhw (h)* (a more substantial emendation; see Christensen 360, n. 6 for discussion); and Heb *sûpâ* (unaltered) carries the meaning "tempest, storm, whirlwind," attested elsewhere in poetic texts (e.g., Isa 17:14; Amos 1:14; Nah 1:3). While any reconstruction of this obscure passage must be tentative at best, Christensen provides a viable alternative for this tantalizing fragment. (Note also Weippert [1979:17], who largely accepts the above reconstruction, but prefers *b-spt* to *b-swph*). See also WARS OF THE LORD, BOOK OF THE.

SUPPER, LAST. See LAST SUPPER, THE.

SUPPER, LORD'S. See LORD'S SUPPER, THE.

SUR (PLACE) [Gk *Sour* (Σουρ)]. A site in the book of Judith, which makes up part of a list of places on the seacoast stretching from N to S (Jdt 2:28). Sur is otherwise unknown under this name; it should be noted that the name "Sur" also occurs in 2 Kgs 11:6 (Heb *swr*) as part of the phrase *bš‹r swr,* that is, the name of a gate in Jerusalem, not a town on the coast. It is likely in any case that this name is a corruption. Two possible explanations have been given for the name "Sur" in the book of Judith. The first is that it is a corruption of Dor (Gk *Dōra;* Heb *dwr* or *d›r*). Dor is a seaport town 15 miles S of Mount Carmel, therefore in the proper geographical location. However, the sequence of towns in Jdt 2:28 appears in the correct N-S order (Sidon, Tyre, Jamnia, Azotus, Ascalon), and identifying Sur with Dor would upset this order. The other suggestion is that Sur is a dittography of Tyre, that is, the Heb *ṣwr* was misread as *swr*, and then transliterated into Greek as *Sour.* This does not explain, however, why the first Tyre was properly transliterated as *Tyros,* and the second was transliterated incorrectly. At present, the site remains unidentifiable. Of course, given the genre of the book of Judith, the name may be entirely fictitious.

SIDNIE ANN WHITE

SUR GATE (PLACE) [Heb *ša‹ar šr* (שַׁעַר שׁר)]. One of several names used to refer to an inner gate of Jerusalem in the NW quadrant of an enclosure that surrounded the Temple precincts and the royal residences (2 Kgs 11:6). Jehoiada the priest stationed troops at this gate as a part of the security arrangements for the coronation of Josiah against his grandmother Athaliah (2 Kgs 11:6; 2 Chr 23:5). These troop deployments were in close proximity to the Temple and the royal residence and suggests that the Sur Gate was a gate of an inner perimeter (Avi-Yonah 1954:240, fig. 1).

The earliest account of Josiah's coronation (2 Kgs 11:6) refers to this gate as the Sur Gate (Heb *sûr,* "turn aside," "depart") while the later parallel account in 2 Chr 23:5 calls it the "Foundation Gate" (rendered in the LXX as the "Middle Gate" because it was a part of the royal enclosure which stood between the Temple precincts and the outer defensive wall). This is consistent with Jeremiah's reference to the princes of Babylon who, after having breached the N outer defenses of Jerusalem, met at the Middle Gate (suggested by some to be between the Corner Gate and the Temple mount, Simons 1952:276 and Avigad 1980:59) before their penetration of the inner and S defenses of the City.

The assignment of the Shallechet Gate to the Temple gatekeepers Shuppim and Hosah (1 Chr 26:16) was most likely referring to the Sur Gate (Heb *šalleket* and *sûr* share a similar indicative meaning and are both translated in the LXX [Codex Alexandrinus] by Gk *ekspan* "draw out" [Isa 6:13; Ezek 11:19] and by Gk *ekpiptein* "go forth" [Codex Vaticanus and Codex Sinaiticus] in Isa 6:13 and Job 15:30). These descriptive names most likely came from the busy intersections near the Fish Gate in the NW corner of the outer defensive perimeter of the city. This exit from the city led to several ridge routes that continued to the coast, to Ephraim in the N and to Judah and Egypt in the S. See Smith 1908:106 n. 2; 260–61.

SUSA (PLACE) [Heb *šûšan* (שׁוּשַׁן)]. Ancient city in SW Iran (mod. Shūsh; 32°12´N; 48°20´E), for a long time the capital of Elam, and later the winter residence and main capital of the Persian Empire. Susa

is located on the bank of the river Chaour (Akk *Ulai,* Gr *Eulaeus*), close to the river Kerkha (Akk *Uknu,* Gr *Choaspēs*). It owes its prosperity and historical importance to its geographical location: at the periphery of the Mesopotamian plain and at the foot of the Zagros mountains. Ethnically, culturally, and politically, Susa was always linked to both Mesopotamia and the Iranian plateau.

A. Biblical References

All biblical references to Susa (Neh 1:1; Dan 8:2; Esther passim; Add Esth 11:3; 16:18) concern the Persian period and suggest some familiarity with the topography of the city (see below). An important Jewish community had settled in Susa, probably after the Persian conquest of Babylon in 539 B.C. (it was still thriving when Benjamin of Tudela visited Susa in the 12th cent. A.D.). One of those Jewish expatriates was Nehemiah, who had acquired an official position at the royal court of Artaxerxes I (464–424).

B. History of Exploration

Scattered over 250 hectares, the ruins of Susa have been described by early 19th cent. travellers like Kinneir (1809), Gordon (1812), Rawlinson (1836), and Layard (1840). First excavated by W. K. Loftus in 1851–52, who identified it with the Persian capital (Loftus 1857), and by M. and J. Dieulafoy in 1884–86 (Dieulafoy 1890–92), the site has been continuously investigated from 1897 to 1979 (except during the two World Wars) by the Délégation archéologique française en Perse/en Iran under the successive directorships of J. de Morgan (1897–1909), R. de Mecquenem (1909–45), R. Ghirshman (1945–67) and J. Perrot (1967–79).

C. History of Occupation

1. Early Periods. Susa is among the first cities known in the Near East. Soon after its foundation, ca. 3900 B.C., a massive terrace, 80 m long and at least 10 m high, probably crowned by cultic installations, was built in the southern part of the first settlement. This area was to remain for nearly four millennia the administrative and religious heart of the city. Graves excavated in its vicinity have yielded a fine painted-ware decorated with highly stylized naturalistic designs, copper objects originating from the Iranian plateau, and stamp seals representing a mythical figure, the "master of animals."

Before the middle of the 4th millennium, this Susa I culture was replaced by a proto-urban culture of Mesopotamian origin. This Uruk period witnessed essential innovations: the appearance of mass-produced wheel-made pottery, the first sculptures in the round, the first cylinder-seals, and especially the first manifestations of writing, i.e., bullae containing calculi, and shortly thereafter, tablets inscribed with numerical signs. Long-distance trade relations and trading outposts in the Zagros and on the Iranian plateau were also established at the same time. Susiana was then "a second land of Sumer" (Amiet 1988:40).

A new culture marking a total break with Mesopotamia emerged ca. 3200. Typified by the appearance of tablets with an original and still-undeciphered pictographic writing and by a new art style, this Proto-Elamite culture extended over the whole of SW Iran and across the Iranian plateau up to the province of Seistan. Its two major centers were Susa and Tall-i Malyan (Anshan), which might have been linked politically and which symbolize the dual character, Semitic and Elamite, of the Elamite culture throughout its history.

2. Elamite Period. This proto-Elamite political configuration collapsed ca. 2800. Incorporated in the Mesopotamian sphere of influence, Susa became just another Sumerian city. On its acropolis were the temples of the local deities: the god Inshushinak and the goddess Ninhursag. The city was prosperous and its merchants were in contact with countries as distant as Turkmenistan, the Indus Valley, and Dilmun (Bahrein). In order to benefit from this Iranian trade, Sargon of Agade annexed the city ca. 2350. Two centuries later, after the fall of the Agadean empire, Susa was integrated to the Elamite kingdom of Awan. A new script, the Elamite linear script, was then briefly introduced as a national reaction to the use of the Sumerian cuneiform writing. This Elamite polity was crushed by Shulgi, king of the third Dynasty of Ur, who annexed Susa and reconstructed the sacred precinct; it included a ziggurat and new temples dedicated to Inshushinak and Ninhursag.

Around 2000, two major Elamite polities, Shimashki and Anshan, emerged in SW Iran. They were instrumental in bringing the downfall of the last Sumerian empire. From then on Elamite civilization took shape, and Susa was to be part of it for the next 1,500 years. The city was first integrated to the kingdom of Shimashki. With the advent (ca. 1925) of a dynasty originating from Fars, it became the lowland counterpart of Anshan as co-capital of the empire of the *Sukkalmah,* who introduced the title of "king of Anshan and Susa" (Elam *šu-šu-un;* cf. Akk *šu-ša-an*) to be used by most Elamite kings until the 7th cent. Actively engaged in Mesopotamian affairs, they created an empire covering most of SW Iran. Susa became a large and prosperous city of about 85 hectares. It had a population of peasants, herders, craftsmen, and merchants dominated by an aristocracy of officials and landowners whose large mansions and private archives, written in Akkadian, have been uncovered in excavations.

During the middle Elamite period (second half of the 2d millennium), Elam reached the peak of its glory. The 13th cent. is dominated by the figure of Untash-Napirisha, who founded a new capital, Tchogha Zanbil, initiating thereby a political and religious reform which did not survive him. The following 12th cent. was the time of the dynasty of the Shutrukids. Its founder Shutruk-Nahunte conquered and annexed Babylonia, from where he brought back large spoils, including the famous Code of Hammurapi, discovered on the Acropolis of Susa in 1900. Such trophies enriched the treasure of temples built or restored by this king and his two successors, who commemorated their deeds in many inscriptions written in Elamite. Susa was then the capital of one of the most powerful kingdoms of the ANE, and its god Inshushinak was sovereign, together with the local deity, in all Elamite cities of SW Iran.

But this brilliant period was short-lived. The empire of the Shutrukids collapsed ca. 1100. Elam experienced a Dark Age from which it emerged only in the late 8th cent. It had then three capitals (Susa, Madaktu, and Hidalu), Susa being the religious center. The Neo-Elamite kings who wrote this last chapter of Elamite history were engaged in an active confrontation with Assyria over the control of Babylonia and the central Zagros. Several decades of bitter fighting culminated in a series of victorious campaigns led by Assurbanipal, who razed Susa in 646.

Elam never recovered from this blow, although a new Elamite kingdom was restored at Susa ca. 625. It survived modestly until the coming of the Persians.

3. Persian Period. The Persian period was Susa's golden age. The city was taken by Cyrus II the Great, probably in 539, just before the conquest of Babylon. The king and his successor Cambyses II may have settled it (cf. Gk *Sousa* in Herodotus 1. 188; 3.30, 65, 70; Strabo 15.3.2), but there is no archaeological evidence of a Persian presence before the reign of Darius I the Great (521–485). In 521/520, immediately after quelling the great rebellion which followed Cambyses' death, i.e., well before he undertook the construction of Persepolis, Darius I selected Susa as the main capital of his empire. This choice was understandable: Located at the heart of an empire extending from India to Egypt, the city occupied a much better strategic position than Babylon, Ecbatane, and Persepolis, to which it was linked by important roads. It also commanded a vast network of communication, especially the "royal road" Susa-Sardis (Herodotus 5.52–53). Disregarding the existing layout of the old city, the king decided to create an entirely new capital of his own. The work proceeded according to a program of great urbanistic coherence and grandiose ambition. It resulted in a complete reorganization of the city which acquired then the main topographic features still existing today (Perrot 1981; Amiet 1988:121–37).

The population of old Susa was probably resettled and the new city, extended to at least 250 hectares, was divided in two parts: in the W the fortified royal city, corresponding to the tells of the ancient Susa, and in the E the unfortified lower city (corresponding to Dieulafoy's *"Tell de la ville des Artisans*"). The two parts of the city were separated by a canal diverted from the Chaour River (the *Ulai* / *Eulaeus*) to run along the N and E sides of the royal city; the latter was thus like an island between two arms of the river (cf. Pliny *HN* 6.31.135; it is this canal or E arm of the Chaour separating the royal city from the lower city which may be referred to in the vision of Dan 8:2). The distinction between the two parts of the city can be noticed in the book of Esther, where "Susa the citadel" (Heb *šûšan habbîrâ*) refers strictly to the

fortified royal city (thus in Esth 9:6, 11, 12), while "Susa" (without qualification) applies to the unfortified lower city (thus in Esth 9:13, 14, 15).

Virtually nothing is known about the lower city, whose present remains are marked by low hillocks corresponding mainly to later occupations. It was probably linked to the royal city by a bridge crossing the E arm of the Chaour and leading to a monumental city gate of 36 m by 18 m (the "gate of Ulai" of Dan 8:2 in the LXX). The latter is the only access known to the royal city.

The royal city was surrounded by massive fortifications; the outer edge of the elamite tells was cut vertically to establish a high glacis formed by a thick massif of earth and bricks, about 20 m wide at its base. This resulted in the creation of a strong city having the appearance of a citadel and dominating the lower city of a height of about 15 m.

The main urban components of the royal city were the complex of the royal palace (= Dieulafoy's *"tell de l'Apadana*") in the NW, the citadel *stricto sensu* (= *"tell de l'Acropole*") in the W and a residential area (= *tell de la Ville Royale*") in the E. Excavations and archaeological surveys suggest that the latter was not densely settled—it probably contained many gardens with some public and private buildings (as in Pasargades and around the Persepolis platform).

The major element in the royal city was the royal palace, which came to symbolize Susa itself (cf. Herodotus's "royal palace," or the "House of Memnon," another name of Susa: Hdt. 5.53). It was the major center of the government of the empire, where a royal treasure was kept (see Hdt. 5.49; Diodorus 17.66. 1). It had been erected on one of the oldest tells of Susa, reshaped and enlarged by Darius' builders to create a platform of 13 hectares, about 15 m high, in the shape of an irregular quadrilateral protruding out of the line of the fortification, like Sargon's palace in Khorsabad. Nearly one million cubic meters of earth and gravel were used in its construction. It was reached from the W through a monumental gate flanked by two colossal statues of the king; the one still *in situ* was 3 m high and was manufactured in Egypt (see *Cahiers DAFI 4*).

Three versions of the foundation chart of the palace (written in Old Persian, Akkadian, and Elamite, respectively) have been uncovered, in which the king tells us about its construction (Stève 1974–75; Vallat 1970, 1986). The whole empire was mobilized to contribute to this vast enterprise, using the material and human resources of each province—the cedar wood came from Lebanon, the *yaka* wood from Gandhara and Carmania, gold from Sardis and Bactriana, lapis lazuli and cornaline from Sogdiana, turquoise from Chorasmia, silver and ebony from Egypt, ivory from Ethiopia, India, and Arachosia. The builders who dug the foundations of the palace and who molded its bricks were Babylonians, the stone cutters were Ionians and Sardians, the gold and silver smiths Medians and Egyptians, the carpenter Sardians and Egyptians, and the walls were decorated by Medians and Egyptians.

This fabulous palace is the setting of the story of Esther, in the time of king Ahasuerus (Xerxes I, 485–465, successor of Darius I). Several notations allow us to suppose that its writer had some topographic familiarity with the palace excavated by the archaeologists.

Covering about 5 hectares, the royal palace had two parts: one residential (the "house of the king" of Esth 5:1) in the S (ca. 3.8 hectares), and one official (the audience hall, or *Apādānā*) in the N (ca. 1.2 hectares) (Amiet 1974; Perrot 1981). The residential part was built in the tradition of Mesopotamian palaces, with blind outer walls and a series of inner courtyards. There were four courtyards in succession, running from E to W. The first was the entrance courtyard, measuring 64 m by 55 m and leading to the private area to the W; it may correspond to the "outer courtyard" of Esth 6:4. The third courtyard gave access in the S to the royal apartment, composed of two successive broad rooms; it is tempting to identify it with the "inner courtyard" of Esth 4:11, 5:1–2. Lateral passages opened onto storerooms on both sides of the royal apartment. To the S (and to the NW?) were private apartments (the harem?) reached by means of a long corridor.

A passage to the N of the entrance courtyard led to the audience hall, or *Apādānā,* which occupied the N part of the palatial complex. While the residential part of the palace was built according to a Mesopotamian tradition, the official part derived from an Iranian tradition (cf. the columned halls of Hasanlu Tepe, Baba Jan Tepe, and Nush-i Jan Tepe, and the palaces of Pasargades). Built by Darius I and

damaged by fire during the reign of Artaxerxes I (465–424), it was restored by Artaxerxes II (404–358). Measuring 109 m on each side, this building must have been an imposing sight: It was composed of a square hall 58 m by 58 m whose roof was supported at a height of 20 m by 36 columns resting on a square base, and of three porticos having each 12 columns resting on a campaniform base and with a capital in the shape of a double bull protome. The Apadana was probably standing on a terrace reached by staircases, like its counterpart in Persepolis, and decorated with glazed bricks representing processions of archers and offering bearers. Covering both the audience hall and the courtyards, this rich decoration derived from an Assyro-Babylonian tradition. Beside the archers and the offering bearers, it showed long rows of lions, bulls, and griffins.

In addition to the royal palace, excavations have also revealed the remains of two other smaller palaces, one built by a successor of Darius I to the SE of the royal city (Dieulafoy's *"Donjon*"), and the other erected by Artaxerxes II to the W of the fortified city, on the other side of the Chaour River (Boucharlat and Labrousse 1979).

4. Later History. Following the Persian defeat at the battle of Gaugamela and the flight of the last Achaemenid king, Susa was taken without a fight in 331 by Alexander the Great, who found immense treasures in its royal palace. The mass marriage to Persian girls of some of Alexander's officers and soldiers and the king's own marriage to Darius III's daughter took place in the city in 324, after Alexander's return from India (Diod. 17.107.4; Plut. *Alex* 70.2).

After Alexander's death (323), Susa was annexed to the empire of the Seleucids (see Boucharlat 1985). It lost its rank as a capital and became a *polis* under the name of Seleucia-on-the-Eulaeus. Although it belonged culturally and politically to the Mesopotamian sphere of influence, it was briefly annexed to the neighboring kingdom of Elymaïs, heir of the Elamites. A center of Hellenism, Susa still enjoyed a relative measure of independence during the 4 centuries of the Parthian period (ca. 150 B.C.–224 A.D.). Inhabited by a cosmopolitan population from all parts of the Near East, it experienced a period of considerable prosperity, marked by many constructions and by an unprecedented agricultural and demographic development.

From Ardeshir I onward, founder of the Sassanian dynasty in 224 A.D., the ancient city was administered by a governor and lost its autonomy. In the 4th century, following a rebellion of its inhabitants, who by then comprised a majority of Nestorians, it was destroyed by Shapur II (309–379) who unleashed his elephants to trample down the city. Reconstructed soon afterwards under the ephemeral name of Iranshahr-Shapur, but neglected by the Sassanian kings who created other centers in the plain of Khuzistan (Gunde-Shapur, Shushtar, Eïwan-e Kerkha), Susa declined steadily during the following centuries. It was, however, in the 5th century, the seat of a Nestorian diocese. After the beginning of Islam (639), when the regional capital was transferred to Ahwaz, Susa experienced again, from the 8th to the 10th cent., a last period of prosperity, to which the remains of a large mosque and of other public buildings together with vessels imported from Samarkand and China bear testimony (Kervran 1985). But decline again followed, until the final abandonment of the city occurred in the 13th cent.

D. Daniel's Tomb

Susa has remained until now a center of pilgrimage involving a medieval tomb now enshrined in a mosque and attributed to the prophet Daniel. This apocryphal tradition goes back at least to the 7th century, and has its roots even earlier since in Sassanian times the tomb was ascribed to Darius or to the mythical Iranian king Kai Khosrow (Streck 1934:594). Through time, the tomb was venerated equally by Jews, Christians, Moslems, and Mandeans.

Bibliography

The early excavations of the 19th century are reported in Loftus 1857 and Dieulafoy 1890–92. The series of the *Mémoires de la Délégation en Perse* (abbr. *MDP* or *Mémoires*)-later entitled *Mémoires de la Mission Archéologique en Iran (MMA1),* and then *Mémoires de la Délégation Archéologique Française en Iran (MDAF1)*-mvols. 1 (1900) to 57 (1976) (published in Paris), include the final reports and studies on the work carried out at Susa from 1897 to 1967. For the final reports and studies on the excavations from 1968 to 1979, see *Cahiers de la Délégation Archéologique Française en Iran,* vols. 1 (1970) to 15

(1987) (Paris) and various studies published in *Paléorient* 4 (1978) 131–244 and 11/2 (1985) 5–130. The end-of-chapter bibliographic orientations in Amiet 1988 are most useful and up-to-date.

PIERRE DE MIROSCHEDJI

SUSANNA (PERSON) [Gk *Sousanna* (Σουσαννα)]. This name refers to two different persons mentioned in the Greek canon of the OT and in the NT.

1. The primary character in the book of Susanna. For further information on the role of this character see SUSANNA, BOOK OF.

2. A member of Jesus' traveling entourage mentioned only in Luke 8:3. Along with other women, she probably supported the group both financially and by helping with the tasks of cooking, cleaning, and sewing. This suggests a rather well-to-do woman, perhaps of independent means, dedicated to supporting the itinerant ministry of Jesus.

Susanna traveled with Jewish men. In view of Jewish attitudes about the behavior of women in public, there is little doubt that Susanna's actions were considered scandalous. Yet the indications are that Jesus approved of women supporting his ministry and accepted women as well as men as traveling companions or disciples. While women often financially supported prominent teachers in early Judaism, the idea of Jewish women becoming students of a prominent rabbi or teacher was unknown and unacceptable prior to and during Jesus' era. Thus, Luke 8:1–3 must be viewed as an indication that Jesus' kingdom agenda had some socially radical consequences.

SUSANNA, BOOK OF. The book of Susanna belongs to the various additions to the book of Daniel, and is preserved in the Greek translations of the Bible—the older LXX and Theodotion. It is not included in the Hebrew canon, and is not mentioned by ancient Jewish writers, including Josephus. The Christian Irenaeus (2d century A.D.) is the first to mention the work in his *Contra Haereses* (5.26). Theodotion's version is somewhat longer than the old LXX.

A. The Story

According to the longer version, Susanna, a daughter of Hilkiah and wife of Joakim, a wealthy Jew in the Babylonian Diaspora, became an object of vehement passion for two of the "elders" who had recently been appointed judges in the Jewish community. One hot day, in accordance with a plan designed by the

elders to proposition Susanna, they hid in the garden of her house while Susanna went bathing. At the moment she dismissed her maids, they approached her, trying to force the young woman to have sexual relations with them both. If she resisted, they said, they would accuse her of committing adultery with a young man. Susanna started screaming as they "shouted against her."

Unfortunately at her trial on the following day, the version of the two elders was accepted without even asking for her testimony, and the assembly of the community sentenced her to death. While Susanna was led away to be executed, God sent the young Daniel, who asked that the two villains be separated in order to cross-examine them independently. When he asked each one separately under which tree Susanna committed the purported adultery, each gave a different answer; one said "under a mastic tree," the other "under a liveoak tree." Thus Daniel succeeded in discrediting their testimony, and Susanna as a result was set free, while the two elders were stoned to death. For the first time Daniel emerged as a hero to his people.

B. The Old LXX and Theodotion

In spite of the fact that no evidence for a Semitic *Vorlage* of Susanna exists, scholars (Kay, *APOT* 1:638–51; Lévi 1933; and Moore *Daniel, Esther, Jeremiah Additions* AB) claim that it was composed in Hebrew or Aramaic. Their arguments are: (a) the appearance in the Gk version of many Aramaicisms/Hebraisms such as *idou, kai egeneto,* and the phrases "as usual" (v 15), and "I'm in a bind!" (v 22); (b) some of the more difficult Gk phrases can be explained as a misreading of a Semitic text—in fact, both Gk versions (Theodotion in particular) do translate easily back into Hebrew; and (c) the frequent use of *kai* ("and"). The existence of a Semitic *Vorlage,* however, should not be regarded as decisive. The Aramaic Danielic literature found in Qumran may lead to some new insights concerning a Semitic text of Susanna.

Another unsolved problem is the relationship between the two Gk translations, i.e., the Old LXX and Theodotion. In the case of Susanna, the differences between the two are more numerous than in the other additions to Daniel. In most instances the additions in Theodotion's version enhance the drama and the psychological aspects of the story, but do not alter the essential plot. If a Semitic original is postulated, it is still not clear whether the two Greek versions are two separate translations of one Semitic text, or of two different Semitic texts. The possibility has been raised that Theodotion is a recension or new edition of the Old LXX translation. The verbatim agreement in great parts of the two Gk versions raises the possibility that while the two translators worked on two Semitic texts, Theodotion also made use of the older LXX.

C. Origin and Purpose of the Story

Many views have been propounded concerning the origin of this "detective story." It is claimed inter alia that Susanna is an apocryphal story, composed in order to demonstrate the downfall of the two false prophets mentioned in Jer 29:21–23 (Fritzsche 1851). Alternatively, it is argued that the story constituted a polemics of the Pharisees against the Sadducees in the 1st century B.C. regarding proper court procedures (Brüll 1877; Ball 1888; Kay *APOT* 1; and Oesterley 1935). Others say that it is merely a secular folktale which was later Judaized (Huet 1912; Baumgartner 1926; and Pfeiffer 1949). Some see in it an echo of a Babylonian myth (Ewald; Kamphausen), while others suggest a Greek mythological origin (Fries). According to this latter view Susanna, like Phryne, was originally a virgin goddess who was attended in her bath by her two slaves who were later put to death. Many variants and allusions to the Susanna story can be traced in later Jewish literature; the most important ones are those appearing in *b. Sanh.* 93a (known also to Origen and Jerome), *Josippon* (10th century A.D.), and the works of Jerahmeel (11th century A.D.).

D. Relationship to Daniel 1–6

The location of Susanna either before Daniel 1 (as in Theodotion, OL, and other translations) or after Daniel 12 (the LXX, SyrH, and Vg) seems to many scholars to be out of place, and disconnected from Daniel 1–6. The reasons adduced are first, that the action of Susanna, unlike Daniel 1–6, does not take place in the Babylonian court. Second, the Jewish community in Susanna is not threatened from the outside and seems to have remarkable autonomy, a situation which is very different from the strained

atmosphere of Daniel 1–6. Third, in the book of Susanna, Daniel plays a secondary role (the real hero is Susanna), whereas in Daniel 1–6 he is the main character.

However, it can be argued that the story of Susanna depicts an earlier stage, in time and place, of Daniel's deeds, and is meant to demonstrate Daniel's piety even as a young person. In all probability this assumption would also correspond to the place and date of composition, which is Babylon, at some time during the Persian era, when the Jews enjoyed a great deal of religious autonomy and freedom. The attempts (in particular by those scholars who believe in a Semitic *Vorlage*) to assign the provenance of the story to Palestine seem unfounded. The *terminus ad quem* can be cautiously fixed at circa 100 B.C., when in all probability, the translation of the Old LXX to Daniel was completed. The story is, unlike other tales of this kind, free of foreign influences—both direct (i.e., in the plot) and indirect (i.e., language and customs). In spite of the fact that Susanna may have originated from a folktale, it has a strong religious atmosphere. Everybody in the story (except the two elders) emphasizes his own adherence to God, and the community is obviously guided by the law of Moses throughout the story.

E. Relationship to the Bible

Many aspects of the story show a close link with the Bible (i.e., biblical law and custom). Susanna's parents are described as being religious people who "instructed their daughter in the Law of Moses" (as prescribed in Deut 4:9–10 and 6:6–9). Susanna is a "beautiful and God-fearing woman," a description used in relation to Judith (8:7–8), Sarah the daughter of Raguel (Tobit 3:14–15; 6:12), and Esther (Esther 2:7 = LXX 2:20). Susanna, like Queen Esther, is "refined and shapely" (Esther D 3 and 2:7). During her trial Susanna is ordered to be unveiled. The LXX presumably means here "stripped naked," which would be in accordance with the penalty for adultery (Hosea 2:5, 11; and cf. Ezek 16:37–40, and *m. Soṭa* 1:5). When the two elders testify against Susanna, they "laid their hands on her head," in accordance with the custom mentioned in Lev 24:14. Susanna was condemned to death in line with the ordinances of Lev 20:10 and Deut 22:21–24.

Daniel, in his questioning, corrects the failure of the community to conduct a cross-examination. The two witnesses, as elders of the community, were not examined in adherence to Deut 19:15–20. Daniel, however, does interrogate them and he may be acting in accordance with what we later find in the Mishnah (*m. Sanh.* 6:1–2). Daniel says to one of the elders: "You shall not put to death the innocent and righteous person" (v 53), echoing Exod 23:7; when he calls the other elder "a descendant of Canaan" (v 56), he may be alluding to Gen 9:20–25 where Canaan is apparently blamed for improper sexual behavior. In v 59 Daniel says: "the angel of God is waiting with drawn sword to hew you in half and destroy the pair of you"; this is reminiscent of Num 22:31 and 1 Chr 21:16. Daniel's conviction of the two elders by "their own mouths of having borne false witness" accords with Deut 19:18–20. Thus, even if the story of Susanna was originally a pagan one, it was reworked so as to appear very biblical. See also DANIEL, ADDITIONS TO.

MICHAL DAYAGI MENDELS

SUSI (PERSON) [Heb *sûsî* (סוּסִי)]. A man from the tribe of Joseph (Manasseh), known only through association with his son Gaddi (Num 13:11). Gaddi was one of the twelve tribal representatives who left Kadesh to spy out the land of Canaan.

TERRY L. BRENSINGER

SUSIYA, KHIRBET (M.R. 159090). A town established in the Judean hills S of Hebron following the Bar Kokhba Revolt.

A. Identification and History

The site is situated 14 km S of Hebron, in the S Judean hills, in a region named Daroma ("South") in Jewish sources and by Eusebius. The Arabic name of the site signifies "the Ruin of Liquorice Plant." The ancient name of the site is unknown, and it has been assumed that it was never mentioned in historical sources. The site is less than 2.5 km SW of Kh. Karmil, identified with Carmel, 4 km SE of Yatta, identified with biblical and postbiblical Jutta, and 3 km E-NE of es-Samu', identified with Eshtemoa. The key to the identification of the site lies in a proper understanding of the history of these sites in the period following the Bar Kokhba War. Eusebius names three Jewish villages in the region S of Hebron: Jutta, "a very large Jewish village" (*Onomast.* 108.8); Eshtemoa/Asthemo (*Onomast.* 26.11); and village in Daroma, or Esthemo, "a large Jewish village in the region of Eleutheropolis" (*Onomast.* 86.20). Carmel is mentioned three times. It is once named Karmelos, the home of Nabal (1 Sam 25:2), and "there is today a village by the name of Chermala, named Karmelos, on the tenth mile from Hebron, and there is stationed a garrison of soldiers" (*Onomast.* 118.5–7). In the second reference, it is named Chermel, "a very large village in the Daroma, near Hebron," and the garrison is mentioned again (*Onomast.* 172.20–23). Finally, he speaks of Chermala, "once named Karmelos. By this name is named today a large Jewish village" (*Onomast.* 92.19–21). In this third instance the Roman garrison is not mentioned at all. Chermula is later mentioned in the *Notitia Dignitatum* as the seat of *equites scutarii Illyricani* (72.6), and in the 6th century C.E. Chermoula was still a place of great importance, mentioned in a papyrus from Nessana. Kh. Karmil, to which all of these references are usually ascribed is 810 m above sea level, and overlooks the ancient roads coming from Hebron and descending to the Judean Desert and the Negeb. It is the only place in the whole region well supplied with spring water, and all other villages depended on rainwater. A Crusader fort occupies the site of the Roman fortress, and the Byzantine period is represented by at least three churches. Kh. Karmil could not have been Eusebius' Jewish large village, which must be sought somewhere else, and A. Negev suggests that Jewish Carmel of the post Bar Kokhba War period should be sought at adjacent Kh. Susiya. The scenario may be drawn as follows: after the Bar Kokhba War and the foundation of Aelia Capitolina, the border between the new city and the remnants of the Jewish territory was drawn somewhere S of Hebron. The Roman army then occupied points of strategic importance at old Carmel, then named Chermala/Chermoula, N of the Jewish region, and at Arad, 20 Roman miles from Hebron (*Onomast.* 14.2), where a Roman fort stood at the S limit of the region.

Between these two forts the Jews lived unmolested. It is possible that the Jews, who felt uneasy in the shadow of the Roman banners, moved to the site of Kh. Susiya, which they named Carmel—the name of their old site. The distance of 2,400 m conforms with the *halachic* Sabbath limit, and may indicate that not all of the Jews of Chermala moved to the new place; they were thus able to use the services of the Kh. Susiya synagogue. Among the dedications of chancel screens found in the synagogue two formulae were observed, one made by "the whole town," and the other by the "holy community," the first referring to the Jews of Kh. Susiya, which was a Jewish town, and the second refers to the Jewish community of Chermala.

From the foundation of new Carmel in the 2d or 3d century C.E., the town prospered throughout the Late Roman, Byzantine, and Early Arab periods. The local economy was based on agriculture, mainly the production of wine and the extraction of olive oil.

B. History of Research

The site was described by V. Gúerin in 1869 (1869:173), who noted the presence of a large building, which he identified as a church facing N. The Survey of Western Palestine visited the site in 1874, and was very much impressed by the quality of local architecture (*SWP* 3:414–15). In 1918 A. E. Mader (1918:182–83) marked Kh. Susiya as a Christian site. While excavating the synagogue at Eshtemoa L. A. Mayer and A. Reifenberg (1937) identified the public building at Kh. Susiya as a broad-house type of synagogue. The site was further surveyed by a team of the Israel Survey in 1968 (1972:70). In 1969–72 the synagogue was excavated by S. Gutman, E. Netzer, and Z. Yeivin (Gutman, Yeivin, and Netzer 1981:123–28). In 1978, Y. Hirshfeld (1983) excavated a dwelling in the W part of the site. Excavations in the town of Susiya were made in 1984 by A. Negev, and in 1985 he was joined by Z. Yeivin.

C. The Excavation of the Synagogue

The ancient site of Kh. Susiya comprises two hills—an E, horseshoe shaped hill, and a W hill. At the N end of the W arm of the horseshoe, where both hills join, is located the synagogue.

The synagogue has doors on the E and N, which lead into a court (ca. 12.5 × 13.0 m) of three arched porticoes. The court and porticoes are paved with large flagstones, except for the S portico which has a mosaic pavement. In the court are two openings—one to a cistern, and the other to a cave (perhaps a quarry which was subsequently used as storage space). A grand staircase leads to a porticoed narthex, of four Corinthian columns between antae, from which three doors lead into the prayer hall (interior measurements 9 × 15 m). At the S end of the narthex, steps ascend to a second story above the S wing of the building. The floor of the narthex is paved with mosaics, having geometric designs and several dedicatory inscriptions. The S wing of the building consists of an oblong hall, which is entered through the narthex, and which has benches along three walls. To the W of this is another room, entered from outside of the building.

The prayer hall was a broadroom type, on an E-W axis. The bema was attached to the middle of the N wall, where apparently was a niche for the Torah shrine. E of the main bema was a secondary bema, for the reading of the law. There were several phases in the development of the main bema. To the later phase belong fragments of the marble chancel screen, which is decorated with menorot, a Tree of Life surrounded by lions, a palm tree surrounded by lions, and numerous fragments of Hebrew and Aramaic inscriptions. There were benches built along the S, W, and part of the N walls.

The long history of the building may be traced in the mosaic floors of the prayer hall. It was originally paved with white mosaics, which was replaced at an early phase with a polychrome mosaic. The W part was divided into three scenes: a hunt scene, Daniel in the lions' den (?), and a damaged panel. The middle panel had a large circle divided into segments, apparently containing the signs of the zodiac. The E part of the floor was decorated by a geometric carpet with birds. In front of the secondary bema was a representation of a Torah shrine flanked by menorot, depicted inside a gabled building. On each side of the building were two stags. At a later phase the zodiac panel was replaced by a geometric pattern with a rosette in its center. The later floor was repaired from time to time with coarse white tesserae.

The earliest mosaic panel was found in the center of the narthex. It was made of very small, colored tesserae, forming a geometric design, surrounding an inscription. The most important dedicatory inscription, lamentably fragmentary, was found near the main entrance to the prayer hall, and contained a date: "the second of the week/ (year) / four thousand / when the world was created." "Week" is used in the sense of the book of *Jubilees*, where jubilees (49-year cycles), "week" of years (seven-year cycles) and single years are used in recording dates. The other dating system in this inscription is of the Creation of the Universe. The most complete and the latest inscription is that found in the S portico: "Remembered be for good the sanctity of my master and rabbi Isai the priest, the honorable, the venerable, who made this mosaic and plastered its walls with lime, which he donated at a feast Rabbi Yohanan the priest, the venerable scribe, his son. Peace on Israel! Amen!" This inscription contains elements which are not earlier than the period of the Geonim (9th–10th centuries C.E..

The excavators tentatively dated the construction of the synagogue to the late 4th or 5th centuries, and its use lasted into the 8th or 9th century, when a mosque was built in the courtyard. At some time, the synagogue was heavily damaged by an earthquake, which necessitated supporting the walls with heavy

taluses. This apparently was the earthquake which shattered the Negeb in 502 or 503 C.E., after which many churches and other buildings were repaired in the same way.

D. Excavations in the Town

The E horseshoe shaped hill covers over 15 acres. The whole settlement seems to have been surrounded by a continuous line of rooms, which did not communicate with each other, but served as a wall; these rooms opened into the settlement. Several sections of this building were exposed: a tower at the extreme N end of the E arm, a section 50 meters long on the S, and smaller sections at the W arm.

The tower, apparently one of the earliest structures on the site, was built of extremely large ashalrs, some as long as 2 m, each decorated by two bosses and flat margins. The S section had outer walls made of smaller blocks of drafted masonry, some with flat bosses. The building consisted of units of one or two rooms built one against the other, starting from the E end of the wall. Between two units of the S building a stepped *mikveh* (ritual bath) was excavated in the rock. Of the lintels found in the debris, one was decorated with two menorot, another with an uninscribed *tabula ansata* (similar lintels were also found in neighboring Eshtemoa and Kh. el-ʿUzeiz, identified with Kefar Aziz). Some of the lintels had slots for affixing mezuzot. On the W arm of the building, two rooms and two entrances leading into the defended quarter were unearthed. These were about 2 m wide, with extremely heavy doorposts, lintels, and door sills.

Two caves were excavated. One cave, E of the synagogue, is entered by an L-shaped stepped corridor. The door leading into the cave had heavy door posts and a lintel carved in the bedrock and which was decorated with a menorah within a wreath, and a *tabula ansata.* The cave is 12 m long and 9 m wide. Part of the E wall, more than 3 m high, is built of excellent drafted ashlars, many of which are decorated with bosses of differing projection. This wall separates a large plastered cistern from the cave. There are one large and several small openings in the cave's ceiling for ventilation and light. At the back of the cave is a small dark chamber, the door of which could be bolted secure, apparently a storeroom for valuables.

Still larger is the second cave, situated to the S of the first cave. A barrel vaulted descent leads to the cave, just in front of which is a *mikveh.* To the right (E) of the entry, a rock wall, faced with hammer-dressed stones, forms a small living room. A similar wall faces also the SW corner of the cave, perhaps another living corner. At this end another stepped corridor leads up to the outside of the cave. The irregularly shaped cave is 25 m long, and its widest width is ca. 14 m. Windows of different sizes drilled into the ceiling, ventilate and illuminate the cave. At the SW corner of the cave a low, narrow passage leads into the innermost part of the cave, where two rooms join at right angles. These measure 6.5 × 4.5 and 10.5 × 6.30 m. The thin rock walls are lined with very thick walls built of hammer-dressed stones. Light and air penetrates this part of the cave by two small, round windows. Originally, this part of the cave had a *mikveh,* but its entrance was blocked at an early phase, when in all probability it was made a wine cellar. The narrow entrance, which could easily be blocked with stones (the blocking stones were found outside the entrance), and the narrow windows, which could also easily be closed, assured a proper atmosphere for wine fermentation.

From the main E entrance to the cave, another corridor leads to a small, rounded room. At the sides of the entrance are a *mikveh* and a small cistern which supplied its water. There were several small niches for lamps in the walls of the room. A rectangular opening in the roof near the steps enabled the safe lowering of jars into the room. Another opening in the W wall communicated with the main cave. This small room probably was where the juice from the wine press was stored in jars before being put in the wine cellar. In the 1985 excavation season, a wine press was discovered in the courtyard above the large cave.

E. Date and Summary

The remains from Kh. Susiya contained mixed pottery dating to the Late Roman and Byzantine periods, a few glazed sherds of the 8th century C.E., and a plethora of painted pottery of the 12th–13th century C.E. Pottery of this late period was found on the lowest living floors, which makes the dating difficult. The only two coins found were of Claudius Gothicus (268–70 C.E.) and of 330–35 C.E. Tentatively the beginning of settlement at Kh. Susiya may be dated to the second half of the 2d or early 3d century C.E., when occupation of the W horseshoe hill began. At this period the settlement consisted of a defensive

building and caves. Some time in the Byzantine period the settlement was abandoned and a new quarter, consisting of houses built of stone was founded on the W hill. Apparently at this stage the synagogue was built. This new settlement flourished until the end of the Umayyad period. In the 9th or 10th century C.E., the Moslems built a small mosque in the court of the synagogue, which had already gone out of use. In the Crusader period, Kh. Susiya was again occupied, but it was finally deserted after the victories of Saladin.

SYENE (PLACE) [Heb *sĕwēnēh* (סְוֵנֵה)]. An ancient Egyptian town, modern Aswan, on the E bank of the Nile near the first cataract (24°03´N; 33°00´E) mentioned three times in the Bible (Isa 49:12; Ezek 29:10; 30:6). Syene is referred to in Isa 49:12 in an oracle of salvation in which the dispersed people of Israel are gathered together again. The MT reading *sînîm* in v 12 has for many years been a matter of confusion among scholars. The text of 1QIsa[a] has the consonantal reading *swnyym,* which is a plural gentilic. This spelling points to a base *swn* which confirms the non-gentilic spelling *sĕwēnēh* found in the Hebrew Bible. Both references to Syene in Ezekiel occur in the oracles against Egypt. Syene is counterpart to Migdol and is used as a metaphor for all of Egypt from N to S (cf. the expression “from Dan to Beer-sheba” in Judg 20:1 and 1 Sam 3:20). Here again there are textual difficulties. In Ezek 29:10 the MT reads Heb *mimmigdōl sĕwēnēh* “from the tower of Syene” which is further defined with the phrase “as far as the border of Cush.” The LXX, however, reads *apo Magdōlou kai Suēnēs* “from Migdol and Syene.” The *kai* possibly points to the Heb *ûsĕwēnēh* “and Syene.” The verse reads further “as far as the border of Cush (Gk *Aithiopōn*).” Here Cush seems to refer to the region beyond the first cataract also known as Nubia or Ethiopia in Greek (cf. discussion in CUSHAN). Similarly in Ezek 30:6 the MT reads “from the tower of Syene,” where LXX reads “from Migdol as far as *(heōs)* Syene.” Here also, in light of the LXX, the Heb word *mimmigdōl* should be taken as a proper name “from Migdol.” The LXX reading of *heōs* points to a Heb reading in which the final *h* would be the *he*-locale. This does not disturb the consonantal text, but still renders as with the LXX the meaning “from Migdol to Syene.”

Next to Elephantine, an island off of the coast of Syene which was the capital of the first Egyptian nome (see ELEPHANTINE PAPYRI), Syene was quite an important city, located right below the first cataract. Strabo describes Syene as a city of both military and commercial importance (17.1.52–54). The Egyptian word from which the modern name Aswan is derived means “trade.” The first cataract served as a natural boundary between Egypt and Nubia. According to the ancient historian Herodotus, as he had learned from

hearsay, the sources of the Nile are to be traced to two springs marked by two peaks between Syene and the island of Elephantine, half of the water flowing N and the other half flowing S (2.28; cf. Strabo 17.1.56). A fortification program was undertaken in the S and NE delta region during the Middle Kingdom (1938 B.C.–ca. 1630 B.C.) These areas were referred to as "the gates of the barbarians" and Syene as "the south gate." However, because of the rapids it was difficult to attack from the S. The rapids also made it very difficult for merchant ships to pass. Cargo first had to be unloaded and either be loaded onto smaller boats that could make it through the rapids or be carried around the rapids on land. Herodotus (2.29) describes how a boat would have to be harnessed between two oxen on land which pulled the boat through the rapids. The loading and unloading of cargo traveling between Egypt and Nubia made Syene a great trade center. The area around Syene was also known for its many mineral deposits. In upper Nubia there are great granite quarries; today one can still see an unfinished statue and an abandoned obelisk. Because of the bareness of the region it is not clear whether or not the people of the area had to depend on food shipped from downstream.

Many ruins still remain on the island of Elephantine. In Syene, however, except for two Greco-Roman temples, not much remains visible, because the ancient city is now underneath the modern city of Aswan. Of interest are the cave tombs at nearby Qubbet el-Hawa on the W bank of the Nile. Among the finds are a large number of inscribed pots which were used as burial offerings (see Edel 1967). The modern city of Aswan is best known for the Aswan dam completed in 1970. Unfortunately a great part of upper Nubia has been flooded due to dam construction and many archaeological remains lie submerged under water. For further discussion of Elephantine and surrounding region see *BMAP*, 1–127.

ARNOLD BETZ

SYLLABIC, BYBLOS. See LANGUAGES (BYBLOS SYLLABIC INSCRIPTIONS).

SYMMACHUS, SYMMACHUS'S VERSION. Symmachus is one of the three Jewish translators used by Origen (mid-3d century C.E.) in the compilation of his Hexapla (see HEXAPLA OF ORIGEN), a document now only fragmentarily preserved. Origen placed the text of Symmachus in the fourth column of his work. There is general scholarly agreement with the tradition that Symmachus produced a Greek translation or revision of the OT after the works of both Theodotion and Aquila. There is little agreement about other factors that relate to the life and work of this enigmatic figure.

A dominant emphasis in ancient accounts of Symmachus was his association with the Ebionites, a Jewish-Christian sect. In modern times, Schoeps (1950) has supported such a connection through a detailed study of Symmachus' generally free rendering of the Hebrew. According to Schoeps, the Greek version of Symmachus exhibits numerous contacts with characteristic elements of Ebionite exegesis and belief. For some, the designation of Symmachus as Ebionite removes him from Judaism; for others, the term does not exclude membership within the Jewish community. Among the latter is Dominique Barthélemy (1974). Although he does not deny that Symmachus may have been an Ebionite, Barthélemy emphasizes another strand in the traditions about Symmachus; namely, that he was a Samaritan who converted to Judaism. In Barthélemy's reconstruction, the Symmachus who translated the Hebrew Bible into Greek—and who was a converted Samaritan, with possible Ebionite leanings—can be identified with Symmachus, the disciple of Rabbi Meir, mentioned in the Talmud.

Barthélemy's identification leads to a date for Symmachus sometime in the third quarter of the 2d century C.E. Other scholars, however, note the absence of references to Symmachus, the translator, in 2d- and early-3d-century sources that could reasonably be expected to take note of him. This leads to a considerably later date, in the second quarter of the 3d century, for the appearance of Symmachus' work. If this is correct, Symmachus may have finished his translation only a short period prior to Origen's use of it.

The sources upon which Symmachus relied have also been much discussed. It used to be argued that Symmachus had consciously set himself in opposition to Aquila, whose extreme literalism he countered

with a free translation more sensitive to the literary value of the Greek language than to distinctive features of the Hebrew. Detailed study of their respective versions does not, however, bear out this contention. Symmachus is not dependent on Aquila, nor does he exhibit extensive knowledge of or interest in Aquila's work. See AQUILA'S VERSION. On the other hand, it is clear that Symmachus knew and used material identified with Theodotion and linked more broadly with the *kaige* recension of the Septuagint. See THEODOTION. Symmachus, although he apparently found many specific renderings of Theodotion to his liking, was unhappy with the earlier translator/reviser's tendency to establish standard or stereotyped representations for many Hebrew words and phrases. Variety, for stylistic or exegetical purposes, was more in keeping with Symmachus' conception of the translator's craft. Again unlike Theodotion, who as a reviser made extensive use of an existing Greek text to prepare his version, Symmachus produced a fresh translation, on the basis of Theodotion-*kaige,* the Old Greek, possibly Aquila and other Greek renderings, and his own understanding of the Hebrew *Vorlage.*

The text that Symmachus created would have found a far wider audience than Aquila's. Its style and its literary achievements were undoubtedly praised by many Greek speakers, who were thus drawn into the world of the Hebrew Scriptures without having to leave their own. In this context, it should be noted that Symmachus generally preferred to supply his readers with translations (often, only guesses) for obscure or technical Hebrew terms that had remained transliterated in earlier Greek versions. On the whole, the work of Symmachus, with its freedom of style and variety of renderings, looked very different from the Hebrew original. Such an approach to translation, whether in antiquity or the modern world, has strengths and drawbacks. For example, Symmachus is far less useful for the textual critic than is the literalist Aquila. By contrast, the many interpretive elements he introduced makes him a valuable source for the study of exegetical traditions. Jerome, a learned and thoughtful observer of both text and interpretation, cast an implicit vote in favor of Symmachus and his approach. For it was Symmachus whom he followed most often in the preparation of his own biblical translation, the Vulgate.

SYNAGOGAL PRAYERS, HELLENISTIC. See PRAYERS, HELLENISTIC SYNAGOGAL.

SYNAGOGUE. The meeting place and prayer hall of the Jewish people since antiquity. During Second Temple times the term "synagogue" referred both to a group of people and/or a building or institution. Although these notions are not mutually exclusive, it is quite probable that at its inception the synagogue did not refer to an actual building but to a group or community of individuals who met together for worship and religious purposes. This entry will explore the nature of the synagogue, first providing a broad introductory overview, and then surveying the evidence pertaining to early synagogues in the Diaspora.

INTRODUCTORY SURVEY

By the 1st century C.E. the synagogue had become so important and central an institution to Jewish life in Palestine that the Talmud of Palestine refers to 480 of them existing in Jerusalem in the time of Vespasian (Kloner 1981:12). One scholar has recently proposed that in Jerusalem alone there were 365 synagogues in the late Second Temple period (Wilkinson 1976:76–77). A Greek inscription from Jerusalem dating to the 1st century C.E., found in the excavations of 1913–14, describes the varied function of the synagogue at that time (quoted in Levine 1987:17):

> Theodotus, son of Vettenos, the priest and *archisynagogos,* son of a *archisynagogos* and grandson of a *archisynagogos,* who built the synagogue for purposes of reciting the Law and studying the

commandments, and as a hotel with chambers and water installations to provide for the needs of itinerants from abroad, which his fathers, the elders and Simonides founded.

Josephus also emphasizes the centrality of the reading of Scripture and the importance of study found in the Second Temple synagogue (*AgAp* 2.175). The NT corroborates such a picture in reporting Jesus' and Paul's frequent visitations to synagogues. During those times they would invariably read or expound Scripture, either the Pentateuch or Prophets (e.g., Luke 4:16–22; Acts 13:13–16).

F. Conclusion

———

A. Origins

The origin of the synagogue is shrouded in mystery, though most scholars would place its beginning in exilic times (Gutmann 1975:72–76). It was the destruction of Jerusalem and its temple in 587/6 B.C.E. and the forced eviction of the Judeans to Babylonia that created the conditions which brought about a complete reappraisal of life. Bereft of temple and country, the Judeans probably under the priestly leadership of Jehozadak (Hag 1:1), undertook to collect and edit their sacred writings. This effort culminated around 560 B.C.E. in the publication of the Primary History (Genesis–2 Kings). Another aspect of the life crisis facing the Judeans in exile was the question of how to worship without a sanctuary located on a holy place. Many scholars assume that the prophet Ezekiel was pivotal in establishing local houses of worship to deal with the matter, citing Ezek 11:16 (with its reference to the *miqdāš mĕ‹aṭ*) in support of the prophet's efforts in this connection. Others have cited the meeting place *(bêt ‹am)* of Jer 39:8 also as reflecting such a need for non-temple worship and meeting.

Whatever the reality of the situation in exile, the fact of the matter is that the response to Cyrus' edict in 538 B.C.E. permitting the Judeans to return to Palestine was underwhelming. Many chose to stay in the Persian diaspora and such a decision clearly indicates that their religious needs were being met. Indeed, cuneiform records and archives reveal a community in Babylonia that retained its Yahwistic identity (Zadok 1979). See also MURASHÛ, ARCHIVE OF. Unfortunately there is no documentary evidence, either epigraphic or archaeological, to verify the existence of the synagogue as structure or social institution. Moreover, Ezekiel's role in advancing an alternative to the Jerusalem temple must also be questioned in view of the fact he was a priest who supported the temple cult and who (in chapters 40–48) vigorously advanced the prospect of a restored temple.

Whatever the case may be for an exilic date for the idea or actual establishment of the synagogue as a place where individuals gathered to worship, read, or recite the scriptures, and to venerate Yahweh, the experience and trauma of the destruction and exile of God's people enabled the Judeans to develop a means of approaching God that transcended the confines of sacred space. The discovery of a number of cult centers outside of Jerusalem—at Kuntillet ‹Ajrud in Sinai or at Lachish in the Shephelah—indicate that the Deuteronomic reform for centralized worship must be viewed in light of the reality of a popular religion that located its cult in numerous places.

The existence of other cult centers outside the land of Palestine—such as at Elephantine in Egypt in Persian times, at Leontopolis in Hellenistic times, possibly in Transjordan in Hellenistic times ('Araq el-'Amir), at the Samaritan temple on Mt. Gerizim, or even at Qumran in Palestine—indicates that the precedent for such a pattern of religious expression was widespread in the Second Temple period. In this context the Gk inscriptions from the Fayyum in Egypt, which date as early as the 3d century B.C.E. and

mention synagogues, are quite understandable. Thus cult centers and the earliest synagogues exist alongside one another from Hellenistic times on. Although the exclusivity of the Jerusalem temple cannot be maintained for this period, its centrality in the life of Palestinian and Diaspora Jews cannot be doubted.

B. Terminology

The terms employed to designate the synagogue reflect the variety of its functions. The earliest terms come from the Second Temple period and are Greek: *synagogue* and *proseuche* (Hengel 1975:39–41; Levine 1987:20–23), the former meaning "house of assembly," the latter "house of prayer." Despite the fact that the status and full extent of the development of private prayer in the Second Temple period is much debated and in doubt, some scholars feel that *proseuche* is the older term, popular since the 3d century B.C.E. In any case, *synagogue* was in use by the turn of the era and came to replace *proseuche* by the 2d century C.E. Hengel has suggested that *proseuche* carries with it the special connotation of Diaspora synagogue, while *synagogue* carries with it the nuance of "Palestinian" in the NT, Josephus, and rabbinic sources (Hengel 1975:41–54). Others have suggested a distinction in meaning between the terms that derives from a difference in architecture and ornamentation, but there seems to be little merit to such a view.

The difference in Greek terms undoubtedly reflects the multiple functions of synagogues in both Palestine and the Diaspora; it also reflects how Jews and non-Jews perceived the role of the synagogue in society. The Hebrew and Aramaic terms of post-70 C.E. also reflect this variety to which is added the *bêt midraš,* or "house of study." *Synagogue* is equivalent to *bêt knesset* and *proseuche* equivalent to *bêt tĕpillâ.* It is noteworthy, however, that as the number of synagogues greatly and rapidly increases after 70 C.E. the nomenclature continues to reflect the varied communal aspects of life that were carried on within the confines of the synagogue, notwithstanding the fact that from the 2d century C.E. on the liturgical life of the synagogue is well documented and fairly stable. (The Jewish community center of contemporary America is a direct descendant of this multi-function ancient institution.)

C. Diaspora Synagogues

Despite the fact that the oldest synagogue inscriptions come from Egypt, we have no archaeological documentation of what they might have been like. Josephus informs us of the centrality of the reading of the Law in the Alexandrian synagogue (*AgAp* 2.175), while the *Tosephta* (*Sukk.* 4.6) refers to other aspects of its furnishings and to its enormous size:

> And a wooden *bema* was found in the center of the synagogue hall, and the *ḥazzan* or leader of the synagogue would stand on the corner of the *bema* with kerchiefs in his hand. When one came and took hold of the biblical scroll to read, the *ḥazzan* would wave the kerchiefs and all the people would answer "Amen" for each blessing (translation after Levine 1987:17).

The oldest synagogue in the Diaspora to be preserved, excavated, and reported is the one from the Aegean island of Delos, birthplace of Apollo. A free port in the 2d century B.C.E., Delos attracted a substantial number of Greek-speaking Samaritans who erected a synagogue there sometime in the 1st century B.C.E. Although earlier scholars doubted the identification of the 16.9 m × 14.4 m synagogue hall, new evidence has enabled a positive interpretation to dominate today (Bruneau 1982; Meyers and Kraabel 1986:186; Kraabel 1987:51). The discovery of a *menorah* on an overall piece of Pentelic marble in the Agora excavations of Athens suggests (but does not prove) the existence of a synagogue there also (Meyers and Kraabel 1986:186).

In Priene, on the Aegean coast in Asia Minor, a small structure once identified as a small house-church is today identified as a synagogue dating from the 3d or 4th century C.E. Two incised *menorahs* near a niche indicate the existence of a place for the Torah scrolls. The largest Jewish community of Asia Minor, however, was at Sardis in Lydia. Its large, basilical synagogue with apse is one of the best preserved Jewish ruins anywhere and dates to the 2d or 3d century C.E. It was destroyed in 616 C.E. An extensive literature exists on this synagogue site and its excavations. The distance from apse to front steps is 100 m, and its width is 10 m. Over eighty inscriptions have been recovered from the building (Kraabel 1987; Meyers and Kraabel 1986:191–92). Another important synagogue of Polycharmos exists in Macedonia (at Stobi) and dates to the 3d century C.E. A later one dates to the 4th century. The 4th-century building

boasts a mosaic floor in a hall of 7.9 m × 13.3 m with walls decorated by frescoes. The base of a Torah shrine may be preserved on the E wall (Meyers and Kraabel 1986:186–87).

At Ostia, the port of ancient Rome, a very large and well-perserved synagogue is preserved in its 4th-century form (24.9 m × 12.5 m). A *bema* occupies the wall opposite the main entrance, and a massive Torah shrine dominates the building. The excavations suggest an earlier, 1st-century building lies beneath the reconstructed later building (Meyers and Kraabel 1986:187–88; Kraabel *ANRW* 2/19:475–510).

The eastern Diaspora is best represented by the astonishing synagogue excavated at Dura Europos in Syria on the Euphrates. The city was destroyed in 256 C.E. thereby preserving its ruins in a most serendipitous way. The broadhouse synagogue with Torah niche is best known for its wonderful wall paintings which depict biblical scenes. Some of the stories represented are the exodus, Elijah reviving the widow, Samuel anointing David, the Philistine capture of the Ark of Yahweh, etc. One of the most famous is the Ezekiel panel that shows God's deliverance of his people from exile and their resurrection in Jerusalem. The synagogue paintings provide an unprecedented opportunity for understanding Judaism in the 3d century C.E. and for assaying the importance of synagogue life on the fringes of the Syrian desert (Meyers and Kraabel 1986:190–91). Its proximity to the church at Dura and to pagan edifices also tells a great deal about pluralism.

The synagogues of the Greco-Roman Diaspora are diverse in style and varied in their architectural layout. Some are large, some are small. Some are basilical, some are broadhouses. In all, however, there is a constancy in the symbols which decorate them. Of special importance is the placement of the Torah shrine as the focal point of worship or centerpiece of the wall of orientation. For the Diaspora the synagogue becomes the vehicle par excellence for communicating what Kraabel calls a "biblical Diaspora theology" and grafting it on to a Greco-Roman social organization (1987:58). It enables Judaism to preserve itself in a healthy, self-conscious way in a pluralistic setting. Although the evidence to date is fairly limited, there is no doubt that future discoveries will continue to shed important light on the social setting of the synagogue in Greco-Roman society. For a survey of the archaeological aspects of these various synagogues, see "Diaspora Synagogues" below.

D. Synagogues in Israel-Palestine

The dearth of new data for ancient synagogues in the Diaspora may be compared with a plethora of new material from Israel/Palestine. Since 1967, systematic survey and excavation has turned up dozens of new important discoveries from the S Judean desert to the N Golan Heights. See Fig. SYN.01. When combined with previously known material and evaluated on its own merit, the Judaism that emerges appears to have been surprisingly variegated, flourishing in Syria-Palestine throughout the Byzantine era until the Arab conquest in the 7th century C.E. The evidence of ancient synagogues thus demonstrates the viability of Judaism for the duration of the Greco-Roman period, and calls into question the commonly held assumption of an earlier generation of scholarship that Palestinian Jewry was in decline towards the end of the Roman period.

If one of the surprising aspects of recent research has been that more synagogues have been identified as being "late," another is that few have been found that are "early." Thus far only three synagogue buildings within Israel/Palestine have been securely dated to the Second Temple period: Gamla, Masada, and Herodium. The building at Gamla in the Golan is oriented towards Jerusalem, is situated close to a ritual bath, and is in the heart of a Jewish town that was at the very forefront of the war against Rome in 66–70 C.E. (Gutman 1981). The Masada synagogue is located on the NW side of the hill, is rectangular in plan with two rows of columns, one on the S side with three columns, and one on the N with two, and four tiers of benches. Its entrance on the SE, opposite Jerusalem, suggests a kind of sacred orientation. Sacred scrolls were found in a small room in the NW that was apparently used to store the scrolls not in use during worship (Yadin 1966:181–91). The building at Herodium is also rectangular with entrances to the E and supported by four columns, and benches on three walls and is located near a ritual bath. Only when compared with Masada does its identification as a synagogue seem possible (Foerster 1973).

The dearth of early Second Temple synagogue remains stands in striking contrast to the large number of synagogues referred to in ancient literary sources; but such an anomoly derives from our modern

misunderstanding of the synagogue as a social and religious institution and the synagogue as a distinct and discrete architectural entity. This apparent contradiction disappears if we assume that, in the first centuries, large private houses were used as places of worship alongside other buildings that came to be utilized for worship and other matters requiring public assembly. In Palestine, it would seem, it was about a hundred years after the destruction of the Temple that the synagogue *as building* began to emerge as a central feature of Jewish communal life. This inference surely may be deduced on the basis of the Second War with Rome in 132–25 C.E., which brought even greater destruction and dislocation than the first war. It was really not until the second half of the 2d century C.E. that Palestinian Jewry achieved any measure of respite from war with all its social and economic implications. It was then that the synagogue as synagogue building emerged, and it first took root in Galilee, the region most heavily populated by Jews at that time.

In Galilee we observe most of the types of buildings that ultimately became associated with synagogues: basilicas with and without apse, and broadhouses. Variety in architectural patterning and ornamentation is accompanied by a repetitive organization of sacred furnishings that culminate in placing the Ark of the Law on the wall facing Jerusalem. The existence of one pattern on one type synagogue, however, does not necessarily mean that another type could not and did not exist alongside another. Indeed, diversity in every sense characterizes all periods and all regions of Palestine where synagogues are to be found.

E. Building Types

1. Basilica. In the basilica, as in the various other forms of the ancient synagogue, the major architectural, if not theological, aspect is the wall of orientation facing Jerusalem. It is generally assumed that this most salient and telling feature of the synagogue is derived from the biblical practice of praying towards Jerusalem (1 Kgs 8:44 = 2 Chr 6:34; 1 Kgs 8:48 = 2 Chr 6:38; Dan 6:11). This custom achieved legal force in the rabbinic period when it is translated into law (*j. Ber.* 4, 8b–c), but the same principle also seems to have been operative in the 1st-century buildings at Masada and Herodium (Foerster 1973). See also Figs. ART.36 and ART.37.

The principle of sacred orientation may be observed in the basilical structure uncovered in the American excavations at ancient Meiron (Meyers, Strange, and Meyers 1978), where the triple facade faces S towards Jerusalem. Most scholars agree that this example dates to a time when the ark was not yet a permanent fixture in the synagogue but was a portable structure brought into the main sanctuary during worship. The precentor, or reader of Scripture, would stand before it facing Jerusalem (though compare the example of the Nabratein broadhouse, where one might have faced the opposite direction, towards the congregation; Meyers and Meyers 1981). Possible representations of a portable ark may be observed in sculpture at Capernaum and in mosaic elsewhere (Hachlili 1976:43–53). It seems that the portable ark of the synagogue harkens back to Nathan's rebuke of David (2 Sam 7:4ff.), when the prophet argues poignantly, in theological terms, for a movable shrine.

Both the orientation of the basilica and the suggested location of the ark require the so-called "awkward about-face" of the worshipper. If the Jerusalem-oriented entrances were both functional and also the focus of worship, the worshipper would have had to turn around immediately upon entering the building from the S. The lack of an entrance on the N, or opposite side would have necessitated such a turnaround. At Meiron and at most other basilical sites, no convincing proof of entrances either on the N, E, or W has been found. The Nabratein basilicas, however, are the exceptions to this rule.

All of this presupposes the existence of some kind of Torah shrine (either portable or permanent) on the interior S (Jerusalem-oriented) wall, even though none has been found in situ; the evidence at both Meiron and Capernaum supports such a theory (Strange, *IDBSup,* 140–41). A novel arrangement was found in the basilica-like synagogue excavated at Beth She‹arim: a raised *bema,* or podium, for the reading of the scrolls is situated in the back wall of the nave opposite the three monumental doorways, which face Jerusalem. The building dates from the second quarter of the 3d century to the middle of the 4th century (Avigad and Mazar, *EAEHL* 1:233–34). If the Torah shrine was portable and brought out during services, we would not expect to find any trace of it today (Kraabel, *NCE,* 438). The excavators at

Beth She‹arim noted significantly, however, that a Torah shrine was relocated on the Jerusalem wall during the last phase of the building's history. The excavator of the Ein-Gedi synagogue also observed this change (Avi-Yonah 1973:341). Both instances tend to suggest a major theological development some time in the late 3d or early 4th century C.E., when public reading of Scripture in a worship setting reached a high point. Whether such a transformation can be related to external circumstances affecting the Jewish community, such as the Christianization of the empire or the reading of Scripture by sectarians, is a matter that deserves further study. S. Lieberman (personal communication) feels that this was a matter of Jewish self-definition vis-à-vis Christians and Jewish-Christians, indicating the Jews' preference for a specific canonical form of Torah.

The origin of the basilica is generally conceded to be the typical Greco-Roman basilica, possibly mediated to Palestine through builders employed by Herod the Great, one of the most notable patrons of Roman building in the E Mediterranean world. Still others suggest that the basilica is mediated through Syro-Roman and Nabatean prototypes. In any case, the synagogue qua basilica is still innovative in that it has adapted a public structure (whether sacred or secular) that emphasizes the exterior and has modified it to suit its own unique religious purposes.

New discoveries indicate a much higher degree of flexibility in dating all types of synagogues than previously believed and attest to the simultaneous existence of more than one type. For example, the basilica at Capernaum is widely regarded as late or Byzantine, whereas the broadhouse at Khirbet Shema‹ is dated much earlier. The only certain way of dating any ancient building is through scientific excavation and scholarly evaluation of the data that emanate from such excavation. With respect to the general categories of synagogue buildings, present excavations indicate even more anomalies than the variation in ground plan and internal furnishing already mentioned, so that even the concept of a standard basilica can no longer be maintained.

a. The Case of Gush Ḥalav. The 1977–78 excavations at the ancient site of Gush Ḥalav (Giscala), just a few km N of Meiron (Meyers 1981), reinforce the opinion that only careful excavation can provide the answers to important questions of dating and typology. In the jargon of field archaeologists, this site provides a classic example of the axiom "the answers always lie below." Kohl and Watzinger, who excavated at Gush Ḥalav during their survey in the early part of this century, clearly did not go far enough in their work; their published plan of Gush Ḥalav indicates they erroneously identified what now are clearly storage areas as the closing, or interior, wall of a very large square basilica (1916:plate 15). The more recent work at Gush Ḥalav, however, has pointed out the errors in the earlier typological assumptions, and reinforces the notion that variety existed even within the broadly defined category of "basilical synagogues." (see Fig. SYN.02)

The founding of the Gush Ḥalav synagogue surely can be dated to the 3d century C.E. However, the S wall, which faces Jerusalem, has only one entrance, the one with the down-facing eagle incised on the underside of its lintel stone. If a gallery for additional seating had existed, it would have been on the N side, where the only other certain entrance to the building was found. What is "basilical" about this building is its two rows of four columns running N–S. It is rectangular only if we define its newly discovered, interior, load-bearing walls as the interior space of the building. Indeed, what is interesting about this building is that these interior walls, on the W, N, and E, demarcate the interior space of the building and internally transform a roughly square structure—originally thought by the Germans to be the synagogue interior—into a rectangular basilica with a large corridor on the W side, a gallery on the N, and a series of rooms along the E. This is a unique arrangement in this kind of building.

Also of major interest is the *bema* along the S wall which happens to be the only ashlar wall among all the exterior walls. This *bema* dates to the 4th century, or second phase of the building's use, and is off-centered in the building, just to the W of the entrance. Among the debris were found smaller pieces of architectural fragments that suggest an *aedicula*, or Torah shrine, in conjunction with this *bema*, possibly built atop it, or perhaps in another, still earlier phase during the 3d century. The discovery of the *bema* at Gush Ḥalav represents the first of its kind in the general category of buildings we call basilical, except for the anomalous findings at Beth She‹arim and Ein-Gedi. The Gush Ḥalav basilica with this plan existed

into the 6th century, when, shaken by the earthquake of 502 C.E., it was destroyed or damaged beyond repair in 551 C.E.

New data from recent excavations are bringing fresh insights. While the material from Gush Ḥalav alters somewhat the old views, it underscores the capacity of an individual religious community for limited originality. The overall architectural forms, however influenced by the surrounding Greco-Roman provincial world, reflect a freedom from rigidity that is refreshing to the student of Roman provincial art.

b. The Case of Nabratein. The 1980–81 excavations at Nabratein, just N of Safed, provide additional unexpected information on the basilical-type synagogue. First, the 3d-century building with six columns, destroyed in a 306 C.E. earthquake, housed a fixed Torah shrine, good portions of which were preserved intact (see Fig. SYN.03). It also had unexpected entrances on the N and E, though as a result of erosion neither one is completely clear. Although the Byzantine basilica, which was dedicated in the time of Justinian (562 C.E.) and survived into the mid-7th century, had no preserved fixed repository for the scrolls, it apparently housed a wooden ark and had no *bema.* Depictions of the possible ark were found on pieces of black ceramic and, hence, its existence seems reasonable (Meyers and Meyers 1982).

More surprising was the discovery of an early broadhouse phase at Nabratein dating to the 2d century. If Khirbet Shemaʿ called into question ideas about the development of the Galilean synagogue, then this building provides the new theorists' coup de grace. Although there is no fixed shrine, twin *bemas* flank the Jerusalem-oriented wall, and a break in the cement in the center of the floor suggests that a table there was used for reading and possibly translating the Torah. Was the biblical interpretation given on the *bema* or at floor level?

A single new excavation could completely shatter the old theories and prove conclusively that a fixed shrine, the *ʾărōn haqqōdeš,* existed in an early Galilean structure. This, then, would indicate that later mosaics and other artistic depictions do, in fact, portray the actual accouterments that existed in the earlier Galilean synagogue.

2. Broadhouse. The broadhouse synagogue receives its designation because its wall of orientation is one of the longer, or broader, walls as opposed to the shorter end-wall in the basilica. Despite the fact that the oldest known example of this type comes from Dura Europos and dates from the first half of the 3d century C.E., this type of building in Palestine was traditionally thought to be late (4th century C.E.) and transitional (that is, between the Roman basilical and the Byzantine apsidal synagogue). In general, its appearance seems to coincide with a time when a fixed receptacle for the Torah had been adopted. Among the known broadhouse synagogues, however, the *bema* is the most widely attested feature and always is situated on the Jerusalem-orienting wall. The broadhouse represents one resolution of awkward about-face required by the basilica: the worshipper could enter as easily through the short wall (and face the Torah shrine) as through the long wall opposite the shrine. Or, the broadhouse simply may represent an independent predilection for an architectural type which already had a lengthy history in ancient Palestine.

Both solutions find attestation in the first and only Galilean broadhouse excavated: at Khirbet Shemaʿ, just 1 km S of ancient Meiron. See Fig. SYN.04. Conclusive dating of two major phases of the Khirbet Shemaʿ broadhouse synagogue to the 3d and 4th centuries C.E. once again forces students of ancient synagogues to put aside preconceived developmental notions of stages and study the evidence alone. Khirbet Shemaʿ, while clearly a broadhouse with orientation in both stages on the long S wall, differs from its closest parallels at Susiyah and Eshtemoʿa in Judea by having internal columnation running E-W, 90° off the wall oriented towards Jerusalem. None of the other broadhouse synagogues so far excavated has supporting columns in the sacred area; instead they use radically widened walls to support the superstructure.

At Khirbet Shemaʿ the first synagogue building of the second half of the 3d century C.E. was destroyed completely in the great earthquake of 306 C.E. The evidence for the destruction of Synagogue I at Khirbet Shemaʿ emerged dramatically in the course of excavations beneath the floor in the E end of the second, or post-306, building; here were recovered fragments of columns, capitals, and bases all shattered so badly that they could only be used as rubble building material or fill.

The destruction date of 419 C.E. for the second Khirbet Shemaʿ building can be easily determined because there is a sharp break in the coin evidence after 408 C.E. Since most 5th-century coins were produced under Arcadius and Honorius early in the century, and hence specimens would not normally be expected, the best explanation for such a radical break in the coin profile is a sudden abandonment of the site. This is further corroborated by the tumbled and badly shattered debris of Synagogue II. Dating by the closest "strong earthquake" after 408 C.E., it is possible to conclude that the occupation of the entire site—comparing all the data from the entire town—came to an abrupt end in the earthquake of 419 C.E. Scientists of the Geologic Survey of Israel, who have just concluded a long-range study of the Upper Galilee region, have studied the pictures of the in situ remains of Synagogue II and were able to confirm the direction of the ancient fall, which is determined by the fault lines, recently plotted by them. Their study has also corroborated the direction of the Gush Ḥalav collapse and has enabled us to explain the extensive repairs done at Meiron in the first half of the 4th century C.E.

In sectioning, or cutting through, the *bema* at Khirbet Shemaʿ, excavators were fortunate enough to recover a number of coins from which it could be concluded that the people at Khirbet Shemaʿ did not wait long to rebuild their sacred sanctuary. Since the rubble-filled *bema* dates to after 306 and because an earlier bench runs through it and along the S wall, it may be concluded that there was no *bema* in the 3d-century building (Synagogue I). Fractured remains of smaller architectural elements, however, suggest that a Torah shrine probably stood on this wall in the first structure.

The origin of the broadhouse, therefore, need not be sought at Dura, but may be viewed as being descended from the basic Syro-Palestinian broadhouse temple. In the case of Khirbet Shemaʿ—as in Nabratein in the earliest structure—we apparently have a "mixed" type, a kind of merger between the Roman basilica (viewing the building E-W with its two rows of four columns) and the Syro-Palestinian broadhouse (viewing the building along the long southern-orienting wall). In any event, it represents a novel adaptation of existing prototypes and gives ample testimony to the ingenuity of the designers.

3. Apsidal. The third general category of synagogue building is the apsidal building, clearly the latest of all types (judging from attested remains and inscriptions) with a basilica-like interior. The novelty of this synagogue type, which began in the 5th century C.E. and continued until the 8th century, lies in the fact that the apse points in the direction of Jerusalem and constitutes the focus of worship. It represents another resolution to the awkwardness of the basilical arrangements described above by enabling the worshipper to face directly in the sacred direction by entering from the E (or from any side opposite the Jerusalem wall). In this type of structure the apse usually is separated from the rest of the sanctuary by a screen and often serves as the repository for the Torah shrine and possibly for the storage of old scrolls.

In many buildings there is a platform, or *bema*, within the apse, suggestive of the place where the reader or precentor stood, along with the cantor *(ḥazzan),* translators, and elders. In this regard it is functionally equivalent to the *bema* at Khirbet Shemaʿ or Gush Ḥalav, though in those places there is only room for the reader of Scripture, or *ḥazzan* (*t. Sukk.v A.I.Sukk.* 4.6 and parallels). The apsidal building provides the best possible arrangement for explaining the rabbinic reference to the elders sitting with their backs towards Jerusalem, i.e., to the orienting wall (*t. Meg.* 4.21). According to this same rabbinic source, the only other time when leaders turned their backs to Jerusalem was during the recitation of the priestly blessing by the priests themselves. In the apsidal structure, perhaps because of Byzantine strictures against the building of new synagogues and even limiting repairs to points of breach, emphasis now is shifted from the exterior to the interior. This shift in emphasis, if indeed such a conclusion is correct, usually is observed in the colorful and richly decorated mosaics which adorn the floors. These mosaics often consist of depictions of biblical episodes but sometimes present borrowed Greek themes as well, such as the signs of the zodiac (Ḥammath Tiberias, Beth-shan, and others). Often, too, the mosaic directly in front of the apse represents the Torah shrine flanked by the menorah (Beth Alpha). Parade examples of the apsidal synagogue may be found at Maon, Jericho and Gaza, Beth Alpha, Ḥammath Tiberias (last phase), and Ḥammath Gader.

F. Conclusion

In summary, one might characterize the state of synagogue studies as being in flux. New material has created a healthy climate of reconsideration and reevaluation. To be sure, many of the old theories have foundered, but that is expected. While there is no longer any typological approach to this subject, the old types still persist. Today, however, they persist in startling new variety. Ultimately when all the new data are published, we will know far more about the ancient synagogue than ever before. From our point of view, the synagogue represents one of the most notable achievements of Judaic civilization, for it is the synagogue that enabled Judaism to survive the transition from temple to private house of worship and from worship within the Holy Land to worship anywhere that Jews might gather.

DIASPORA SYNAGOGUES

Our knowledge of the Jews in the Diaspora is based on often unclear Jewish literary sources, from the writings of church fathers and pagan sources, and from archaeological excavations. The excavations are important because they provide concrete material relating to the lives of the Jewish communities in various countries. Thus it is worthwhile here to examine the data gathered from these archaeological discoveries—particularly from excavations of synagogues—and thereby to present a clearer picture of the present state of the Diaspora Judaism research.

———

A. Descriptions

Although there is still some doubt as to whether remains from Aphrodesias (Turkey), Athens, and Corinth provide evidence of ancient synagogues, a number of structures excavated in the Mediterranean and Near Eastern world are without doubt the remains of synagogues built and used by Jews of the Diaspora (although those of Misis in Turkey and Elche in Spain are still debated).

1. Dura Europos. This synagogue, located in a small trading caravan-town on the Euphrates River in Syria, was excavated from 1932 (Kraeling 1979; Goodenough 1953–68:vols. 9–11). The Jewish community there lived under Roman rule, and their synagogue was destroyed when the Sassanians destroyed the town in 256 C.E. The synagogue had two stages of building, each with a different architectural plan and decoration. *Synagogue I* dates to the 2d century—before ca. 245 C.E., while *Synagogue II* dates to 245–56 C.E. Both synagogues were part of a house complex and consisted of a forecourt and a rectangular main assembly room (14 × 8.7 m) with two entrances from the courtyard on its E wall. On the W wall the Torah shrine niche was built to hold the ark of the scrolls. In Synagogue II, all four walls were elaborately decorated with biblical scenes; there were also some other changes and remodelling done in this second stage. See also DURA-EUROPOS.

2. Ostia. At Ostia, the ancient port of Rome, a synagogue of two periods was excavated in 1961–62. A 1st-century synagogue was found under the later building, with a similar plan (but without a Torah shrine). The plan of the later synagogue consisted of several rooms, probably built in two stages: an entrance hall with three doors, and a main hall with its W wall slightly round; attached to it from inside is a platform *(bema).* Between the entrance hall and main hall 4 columns were found. In the later stage, a Torah shrine was built at the SE corner of the main hall, blocking one of the earlier entrances, appearing as an additional rather than original structure. Its architraves were decorated with carvings of Jewish symbols (shofar, menorah, ethrog, and lulav). The floor of the vestibule was a black and white simple mosaic. The main hall had an *opus sectile* floor.

3. Stobi. Three buildings, one above the other, were found in excavations conducted since 1970 in Stobi (Macedonia, Yugoslavia); two of them are synagogues, both under a later church (Moe 1977).

Synagogue I, the earlier of the two, is also known as the synagogue of Polycharmos. Among the remains was an inscription (*CII* 694). The building was probably Polycharmos' private house which he subsequently donated to the Jewish community (he and his family probably lived on the second floor). The synagogue walls were decorated with fresco geometric designs, sometimes inscribed with the name of Polycharmos. Also found were a few pavement stones and a copper plaque. The plan of the later Synagogue II is more clear and detailed. It had a main hall (13.3 × 7.9 m) with a Torah shrine structure on the E wall (oriented toward Jerusalem). The hall's floor was decorated with geometric-designed mosaic, while the walls were covered with fresco and molded stucco.

The archaeological evidence suggests that the structure was probably originally a house built between the 1st and 2d centuries, donated in the 2d century by Polycharmos for use as a synagogue, and then rebuilt and remodelled for its new function in the 2d–3d century. On top of the later synagogue a church was built (late-4th or early-5th century), purposely replacing the synagogue by a Christian basilica church.

4. Sardis. The Sardis (Turkey) synagogue was built as part of the Roman gymnasium-bath complex. It might have been a public building, later turned over to the Jewish community and then sealed off from the rest of the complex. The synagogue was in use from the 3d century on and was remodelled several times (Seager and Kraabel 1981). The later synagogue (now reconstructed) from the 4th century is the largest Diaspora synagogue found to date. It consists of an atrium forecourt with 3 entrances and a main hall ending in an apse with benches on the W. On the E wall of the hall two Torah shrines flank the central entrance. Six piers are built on the N and S walls. In the center of the hall, a platform was built, and close to the apse an "eagle table" stood flanked by two stone Lydian lions in second use.

Mosaic floors with geometric and floral designs decorated the hall and court. Inscriptions were incorporated into various sections of the mosaic. The walls were decorated with marble pieces and the ceiling was painted. Many inscriptions were found, mainly donations inscribed in Greek. The synagogue

had several stages of building alterations between the 3d and 4th centuries, and the last synagogue was abandoned and destroyed with the rest of the town in 616 C.E. (Seager and Kraabel 1981:172–74).

5. Priene. The building (also in Turkey) was first identified as a house-church, but several artifacts found at the site proved the building was a synagogue. These included two plaques with Jewish symbols (the menorah, shofar, a lulav, and ethrog) that were discovered on the floor in front of the Torah shrine (Goodenough 1953: fig. 878, 882). Another relief was found with an unfinished, carved menorah. The building was a rectangular, rebuilt house measuring 19 × 14 m. A niche was built into the (Jerusalem-oriented) E wall. Some additional rooms surrounded it. The synagogue probably was in use in the 3d–4th centuries.

6. Delos. This synagogue building on the island of Delos was probably the earliest synagogue in the Diaspora, the structure being in use from the 1st century B.C.E. It might have been a 2d century B.C.E. house that was subsequently remodeled as a synagogue. The identification of the building as a synagogue is based on the plan of the house and on dedication inscriptions on bases found in two rooms of the building. On the basis of these, an argument followed as to the identification of the structure. Some scholars are against identifying it as a synagogue (Sukenik 1949), while others strongly support such an identification (Bruneau 1982; Kraabel, *ANRW* 2/19:475–510; White 1987). The main argument against Delos being a synagogue is the absence of Jewish symbols, and the discovery of a group of 1st–2d century C.E. lamps, some with pagan symbols.

The Delos structure is a main hall (16.9 × 14.4 m) later divided into two rooms by a wall with three entrances. Room A had benches along the walls with a marble throne "seat of Moses" on the W wall. Several rooms and portico are on the S and E of the main hall. The identification of the Delos structure as a synagogue is difficult and problematic because of its early date, a time when Jewish symbols were not used, and because the building did not have a general identifying plan. However, it seems that the arguments presented by Bruneau, Kraabel, and White in favor of the Delos synagogue are convincing.

7. Aegina. In this city in Greece a synagogue building was found consisting of a main hall (13.5 × 7.6 m) with a semicircular apse (5.5 m) on the E wall. Probably three entrances were constructed on the W wall. On the N wall several rooms were added. Its floor was paved with a geometrically designed mosaic. Close to the entrances, at the border of its W part, inscriptions were laid mentioning Theodoros, the Archisynagogos who constructed the building. At the E end of the mosaic border, in front of the apse, the center of the border is suddenly paved with white mosaic tesserae. This suggests that a *bema* stood there. Beneath this synagogue were found the remains of an earlier building, possibly pointing to an earlier structure (of a synagogue?). The Aegina synagogue is dated to the 4th century.

8. Apamea. The Apamea synagogue in Syria yielded only an elaborate mosaic floor with a number of inscriptions, all donations to the synagogue of various people (Goodenough 1953, 2:83–84 and bibliography there). The mosaic floor design is comparable to other Apamea pagan and Christian mosaic floors and to the school of Antioch mosaicist. It includes a menorah in one of the carpets on the S end of the remaining mosaic floor. There was a square niche, probably the Torah shrine, on the S wall (probably close to the menorah on the floor), which in Syria was the wall facing Jerusalem. The floor was found under a later church. Here, as in other Diaspora synagogues, a church replaced the synagogue, probably in the 5th century. The synagogue is dated to the late 4th century on the basis of its dated inscriptions.

9. Hammam-Lif. The synagogue, discovered in 1883, is situated near Tunis in N Africa. The building consisted of a complex of rooms. The main area of rooms (b, c, d) were the main part of the synagogue. The main hall (c) probably had three doors leading into it. It had a niche on the W wall, perhaps with a *bema* in front of it. The room was floored with mosaics, its design including birds and fish (nilotic scene), and in its center there was an inscription flanked by Jewish symbols (the menorah and ritual objects). Except for the inscription and the Jewish symbols, the other designs are reminiscent of contemporary N Africa mosaic floors. Two other inscriptions were found which might have been connected with a genizah (the burial of a Torah scroll). On the basis of its mosaic art, the synagogue is dated to the 6th century (see Goodenough 1953, 2:89–100).

10. Philippopolis. A recent excavation in Bulgaria discovered a synagogue dated to the end of the 4th–early-5th centuries. The plan is not exactly clear, but a mosaic floor depicting a large menorah was found, as was an inscription mentioning donors having Jewish names.

11. Elche. This building (in Spain) consists of a main hall (10.9 × 7.55 m) ending with an apse on its E wall. The entrance was on the opposite W wall. It had a floored mosaic with Greek inscriptions. Scholars disagree as to whether the building might have been a church or synagogue. Wischnitzer (1964:12) suggests that it might have served originally as a synagogue, being later remodeled for use as a church, as we know from other locations (such as Apamea and Stobi).

12. Misis, Mophostia. The remains of the building in Misis (Turkey) consist mainly of elaborate mosaic floors and very few architectural remains. The mosaic floor in the central part shows the biblical story of Noah's Ark, with animals and birds surrounding it. On the N aisles the Samson story was depicted apparently in 14 scenes. Biblical scenes were not depicted on church floors (except for the Jonah story in the Aquila church), but several such scenes occur on synagogue floors in Palestine/Israel (Beth Alpha, Gerasa, Naaran). The original excavator maintained that the building was a 4th–5th century church.

B. Diaspora Synagogue Architecture

The most important feature of the research of Diaspora art and architecture have been the archaeological discoveries of synagogue buildings surveyed or excavated in Syria, Turkey, Greece, Italy, Yugoslavia, N Africa, Bulgaria, and Spain. These synagogues do not have much in common architecturally; in fact, they rarely have similar features either with one another or with synagogues in Palestine.

The plans seem to be local and not part of established types. However, there were two factors that determined the architectural plan of each of the Diaspora synagogues. The first was the local artistic and architectural traditions and fashions. But secondly, several circumstances peculiar to the Diaspora synagogues seem to have exerted some influences that ultimately determined their plans. For example, some synagogues were regular houses which were subsequently converted into assembly halls (e.g., Dura Europos). Some synagogues were built as part of a public complex in a prominent site in the city (e.g., the Sardis synagogue, which was part of the monumental Roman bath and gymnasium complex). A very important fact in the fragmentary architectural survival of some Diaspora synagogues was the intentional converting of the synagogue into a church (probably in the 4th–5th century C.E.; e.g., Apamea). Also, many of the Diaspora synagogues had two phases of buildings.

However there do appear to have been some characteristic features of the Diaspora synagogue. Some of them had a forecourt. Their facades were not usually decorated and had either triple entrances (Sardis, Ostia) or a single entrance (Priene). Dura Europas had two entrances leading from the courtyard to the assembly hall. A unique feature was the main hall, which was not divided by columns; it was usually a hall with a Torah shrine, elders' seat, and sometimes benches. In the Sardis synagogue the pillars were built so close to the walls that the hall was not divided into a main and side aisles (as was customary in many synagogues in Palestine).

The main feature and focal point of the Diaspora synagogues was the Torah shrine (see Hachlili 1988: chap. 8), which consisted of three forms: (1) an aedicula (Sardis, Ostia); (2) a niche (Apamea and Priene); or (3) an apse (Aegina). The Torah shrine was built on whichever wall happened to be oriented towards Jerusalem.

C. Synagogue Art

Art in the Jewish Diaspora can be seen in synagogue ornamentation and Jewish catacombs wall paintings. See ART AND ARCHITECTURE (EARLY JEWISH) EARLY JEWISH ART AND ARCHITECTURE. Most of the synagogue ornamentation consists of mosaic floors. They depicted mainly various geometric patterns, and some had Greek donation inscriptions, sometimes with Jewish symbols (such as the menorah and the ritual objects) added to the design (e.g., Sardis' mosaic floors, Aegina, and Apamea).

The most important and unique expression of synagogue art is the cycle of biblical scenes in the elaborate wall paintings of Dura Europos. The paintings there cover all four walls of the synagogue hall,

reflecting an important development of narrative depiction in the 3d century C.E. For years scholars have been studying these paintings trying to ascertain the nature of their significance. Some have maintained that some other painted synagogues in Mesopotamia and Syria were the models for the paintings in the provincial city of Dura Europos. Others try to fit them into Parthian art or "provincial" Roman art. Some scholars suggest that the whole cycle was painted by local artists, a single master and his assistants; but because of the difference in composition, others maintain that the local paintings were created by various painters. Kraeling and others suggest the Dura artists used pattern books, probably manuscripts or other pictorial sources. The only exception is the painting of the Sacrifice of Isaac and the cultic object above the Torah shrine, which has been suggested as being influenced by similar depictions in synagogues in Palestine.

The style of the Dura paintings shows pictures of static compositions and postures; the figures are usually depicted with expressionless faces and in strict frontality. The scenes and details of figures, dress, and objects are stylized, colors are rich, and space is usually completely filled. Scholars have found Greek and Parthian elements, but not much of Roman art. Some motifs, however, are found only in Durene art.

D. Jewish Symbols

The most common of Jewish symbols depicted in Jewish Diaspora art (as in Palestinian Jewish art) is the menorah. The menorah is depicted on mosaic floors, wall paintings, and inscribed on walls and tombs. It frequently appears along with ritual objects. The ark of the scrolls is seldom depicted (only on Dura paintings, on some Jewish catacombs wall paintings, and on some of the gold glasses found in these catacombs). Depictions of ritual objects (the lulav, etrog, shofar, and a vase) frequently have been found flanking the menorah. Narrative biblical scenes occur only on Dura Europos paintings (the Misis mosaic floor, if it is indeed a synagogue, also has biblical scenes).

E. Inscriptions

Inscriptions provide a great source of information about Diaspora synagogues. Some inscriptions were found in excavated synagogues, and many were found in places which might indicate that a synagogue was once there. About 150 inscriptions related to synagogues have been found in the Diaspora (Roth-Garson 1988; Frey 1975; Lifshitz 1967; Leon 1960):16 inscriptions in Egypt (from Alexandria and other places); 27 inscriptions from Syria (19 from the Apamea synagogue and 3 from Dura Europos); 4 from Cyprus; and 13 inscriptions from Greece. Asia Minor has yielded the most, including about 80 from Sardis (only a third of which have been published). Three inscriptions were found in Stobi (Yugoslavia), while Spain, Sicily, and Cyrenaica yielded one inscription each. (All our information about synagogues in Rome came from tombstones and burial inscriptions.) See JUDAISM (IN ROME). Most of the inscriptions are dedicatory, indicating the names of donors and some information about their donation, sometimes giving his or her profession or date. Many of the donors indicate their reason for the donation. All the data gained from these inscriptions enable us to have a much richer knowledge of Jewish Diaspora life.

F. Dating of the Synagogues

Most of the Diaspora synagogues had several stages of use, but most of them were either built in the 3d–4th century C.E., or flourished at that time. The Delos and Ostia synagogues were probably the earliest Diaspora synagogues. The Dura Europos synagogue is dated to the middle of the 3d century C.E. The dating of the end of some synagogues is determined by their subsequent conversion into churches, probably in the 5th century.

SYNOPTIC PROBLEM. The first three gospels in the NT canon—Matthew, Mark and Luke—are known as the "Synoptic" Gospels, so called because they can be viewed side by side ("syn-optically") and compared very easily by means of a synopsis. The reason for this is that all three gospels have a great deal of material in common and very often they present their material in the same order. Further, the very different type of material, and the different arrangement, in the Fourth Gospel shows that this agreement between the Synoptic Gospels cannot be explained as due to chance or to the fact that the synoptic narratives simply reflect the actual course of the historical ministry of Jesus. The three Synoptic Gospels are thus in some relationship with each other, and the problem of determining the nature of that relationship is known as the synoptic problem. See also SOURCE CRITICISM (NT); TWO-GOSPEL HYPOTHESIS; TWO-SOURCE HYPOTHESIS.

B. Markan Priority
C. The Q Source
D. The Sources M and L
E. Conclusion

———

A. Introduction

The history of the study of the synoptic problem is a subject in its own right. Many solutions have been proposed. For example, it has been suggested (a) that the agreements between the gospels are due to dependence on oral traditions; (b) that the present gospels are dependent on an earlier gospel; (c) that the three gospels are in a direct relationship with each other, the agreements between them being due to the fact that one (or more) evangelist has used the work of another. Today, the most widely held solution to the synoptic problem is the so-called Two-Source theory, and this proposes a combination of (b) and (c) above: in the material where all three gospels are parallel, the agreement between them is due to the fact that Mark's gospel is the direct source of the other two; in the material where Matthew and Luke alone are parallel to each other, their mutual agreement is due to dependence by both on common source material, now lost but usually called "Q" (the synoptic sayings source).

It is almost universally agreed today that the "oral" theory is insufficient to explain the agreements between the Synoptic Gospels. These agreements include not only verbatim agreements in the Greek versions of important sayings (e.g., Matt 7:7–11 = Luke 11:9–13; such agreement could be explained by oral tradition), but also agreements in the order of the material which at times go beyond anything that could be expected to be memorized in oral tradition. For example, Matthew and Mark break their

narrative of the ministry of Jesus to go back in time to give an account of the death of John the Baptist, and they do so at precisely the same relative point in their accounts (Matt 14:3–12 = Mark 6:17–29). Dependence on oral tradition can scarcely account for such a phenomenon of interruption of the story of Jesus' ministry at identical points in the two gospels. A similar example occurs in the story of the healing of the paralyzed man. In Mark, Jesus says to the scribes "But so that you may know that the Son of Man has the power on earth to forgive sins," a sentence which is never quite finished since the next words of Jesus are the command to the paralytic to take up his bed and go home. There is a slight break in the narrative and Mark fills in the gap with an extra comment: "and he says to the paralytic." In fact all three evangelists make precisely the same intervention at exactly the same place (Matt 9:6 = Mark 2:10 = Luke 5:24). Dependence on oral tradition could easily account for the memorable sayings of Jesus being recorded in identical form; but such dependence cannot really explain a story being preserved in such an untidy way and yet in otherwise independent narratives. The nature of the evidence thus demands some kind of *literary* relationship between the gospels.

As already stated, the most popular theory today is the Two-Source theory. However, there have always been supporters of other theories, among these the so-called Augustinian theory (that Matthew came first, Mark second and Luke third; Butler 1951), and above all in recent years, the Griesbach (or Two-Gospel) hypothesis (Matthew came first, Luke used Matthew, Mark came third using both Matthew and Luke) (Farmer 1977; Dungan 1970; Orchard 1976). Others have questioned parts of the Two-Source theory by denying the necessity of Q while still maintaining Markan priority (Farrer 1955; Goulder 1974). More complicated theories of prior sources with complex relationships between these different stages of the tradition have also been proposed (Boismard 1972). Not every solution to the synoptic problem can be discussed here. In order to structure the discussion, the Two-Source theory will be defended here, considering separately its two main aspects, viz. Markan priority and the Q hypothesis, and taking note of alternative explanations of the various phenomena discussed.

B. Markan Priority

The case for Markan priority is more of a cumulative one than a theory based on one logically cast-iron argument. In the English speaking world, the classic formulation of the case for Markan priority is often thought to be the discussion of Streeter (1924); and although this can be and has been criticized, Streeter's categories of evidence still provide a useful starting point for the contemporary discussion.

Streeter's first argument concerned the contents of the gospels. He pointed to the fact that practically all the contents of Mark also appear in either Matthew or Luke, and frequently in both; from this he deduced that Mark's gospel was the source of the other two.

On its own this argument can carry no weight at all. The fact that Mark's contents are almost all paralleled in Matthew and Luke simply shows that there is a relationship among the three gospels, but it does not determine what that relationship is. Per contra, neo-Griesbachians would argue that the evidence could be just as easily explained if Mark were writing third, and including in his gospel everything which was common to both his sources.

However, when one ceases to argue abstractly and considers the actual contents of the gospels themselves, then the case for Markan priority can be strengthened. In general terms, it is easy to see why, if Mark were written first, Matthew and Luke might have produced their gospels. Not only is Mark's gospel much shorter than the other two: it is also a great deal more verbose in the material it shares with Matthew and Luke. Thus, if Mark were written first, Matthew and Luke must have reproduced practically all of the substance of Mark while omitting some of Mark's redundancies in wording, and also supplemented Mark with further material available to them from other sources. The converse is rather more difficult to envisage. If Matthew's gospel were written first and was used by Mark (the Augustinian hypothesis), why did Mark produce such a short gospel, omitting so much more material from Matthew? Why did he omit so much of the teaching of Jesus, including the Sermon on the Mount and the Lord's Prayer? Why too did he expand much of the material he did retain with such inconsequential details so that the same story is often twice as long in Mark as in Matthew? The Griesbach hypothesis fares little better here. Neo-Griesbachians do not always agree on the precise procedure which Mark allegedly

followed: did Mark make it his primary aim to include only what was common to his sources? Or did he proceed by following his two sources alternately? Either way it is hard to envisage why Mark should have done this to produce his present text on the basis of Matthew and Luke. Why did he omit the preaching of John the Baptist (common to both his sources: Matt 3:7–10 = Luke 3:7–9)? Why did he omit the Great Sermon which was also in both his sources? (Or if he followed his sources alternately, he seems to have switched sources very carefully to avoid the Sermon. Why should he have done this?) No very satisfactory explanation seems forthcoming. Thus the argument from common content, when expanded by reference to the actual contents themselves, does have some force in supporting the theory of Markan priority.

Streeter's next argument concerned the order of the stories in the gospels. He appealed to the fact that the order of Mark always agrees with that of Matthew, or of Luke, and often with both; but Matthew and Luke never agree against Mark in order. Streeter deduced from this that Mark must have been the common source used independently by Matthew and Luke. (Streeter's third argument applied precisely the same logic to the phenomenon of the wording within each pericope, where, for the most part, Matthew and Luke fail to agree against Mark.)

This argument has frequently been attacked as providing no support at all for the theory of Markan priority. To claim that Markan priority is the only theory which will explain the facts is to be guilty of the "Lachmann fallacy" (Butler 1951; perhaps an unfortunate term since Lachmann did not argue in this way, and the argument is not strictly "fallacious" in the sense of proposing a patently false conclusion of the type 0 = 1). The evidence only shows that Mark occupies a *medial* position in the pattern of relationships between the gospels. The evidence can be adequately explained by the theory of Markan priority, the Augustinian hypothesis, and the Griesbach hypothesis.

Once again, however, a consideration of the gospel texts themselves can strengthen the case for the theory of Markan priority. The deviations in order between Matthew and Mark, and between Luke and Mark, are relatively small in number and can be quite easily explained as due to the redactional activity of Matthew and Luke respectively. (This was the way Lachmann himself argued.)

For example, assuming that the Sermon on the Mount (Matthew 5–7) should be placed in the gap between Mark 1:21 and 1:22 (Neirynck 1972), Matthew's changes become intelligible. He brings forward the story of the healing of the leper (Mark 1:40–45) to be the first miracle after the Sermon (Matt 8:1–4); this supports his picture of Jesus as the fulfillment of the OT dispensation (the command to the leper to go to the priests in Matt 8:4 is now the climax of the story; cf. 5:17). He brings forward the story of the stilling of the storm (Mark 4:35–41 = Matt 8:23–27) and redacts it to make the story a paradigm for true discipleship. Its new position in Matthew, following the call stories (Matt 8:18–22), is now thoroughly appropriate in a section on discipleship. Matthew also brings forward the stories of the healing of the woman with the hemorrhage and the demoniac (Mark 4:35–5:20), redacting them en route, to highlight the theme of faith and true response to Jesus. Other changes by Matthew include the transfer of the call of the 12 (Mark 3:13–19 = Matt 10:1–4); this can be explained as due to Matthew's tendency to systematize his material into thematic blocks. Also the anticipation of the section about Jewish persecutions (Mark 13:9–13 = Matt 10:17–22) can be explained if, as seems likely, Matthew emanates from a situation of intense Jewish hostility. Jewish persecution is, for Matthew, an experience of the past and present, not necessarily a mark of the eschatological future.

Luke's changes are less numerous. The transfer of the rejection scene (Mark 6:1–6 = Luke 4:16–30) is due to the programmatic significance which the story has for Luke. The transposition of the mass healings and the call of the 12 (Mark 3:7–12, 13–19 = Luke 6:17–19, 12–16) serves to create an audience for the Great Sermon. The postponement of the story of Peter's call (Luke 5:1–11 cf. Mark 1:16–20) serves to make Peter's response psychologically more plausible, coming as it now does after a certain amount of Jesus' activity. Thus the changes in order which the theory of Markan priority has to assume can be explained reasonably adequately in terms of Matthew's and Luke's redactional interests (Tuckett 1984b).

Competing hypotheses fail to explain the order of the gospels so well. For example, the Augustinian hypothesis cannot really explain why Mark should have changed the Matthean order in the way he must

have done. So too Luke's procedure is very difficult to explain in detail: Luke must have retained the Markan sequence very accurately, but must have changed the order of other material from Matthew considerably. The obvious case of Lukan reordering would be breaking up Matthew's Sermon on the Mount and distributing the teaching material contained there in many different parts of his gospel.

Neo-Griesbachians have claimed that in fact, the evidence which Streeter referred to (the failure of Matthew and Luke to agree against Mark in order) not only does not prove Markan priority: rather, it points quite clearly to the Griesbach hypothesis. Thus it is argued that the failure of Matthew and Luke to agree against Mark is really too good to be true, assuming Markan priority: Matthew and Luke must have had some conspiracy to ensure that one would always support the Markan order when the other departed from it. The evidence is then only explicable on the theory of a conscious redactional decision by Mark to follow both his sources when they agree, and to follow one at a time when they differ. Only in this way is the pattern of "alternating agreement" explicable.

Such an argument is, however, open to criticism. The argument deduces from the same evidence (the lack of Matthew-Luke agreements against Mark in order) that one and only one solution to the synoptic problem is viable. But this is just a repetition of the "Lachmann fallacy" in slightly different guise; it is claiming that the facts can be explained by only one hypothesis, and Butler showed that the facts themselves are ambiguous. Neo-Griesbachians have also failed to explain Mark's procedure in detail. If Mark indeed followed his two sources alternately, why did he choose to do so in precisely the way he did? Why did he switch sources just where he did? (We are back to the question of the content of Mark's gospel.) No comprehensive answers to these questions seem yet to have been given.

Streeter's fourth argument concerned the nature of Mark's Greek compared to that of the other two gospels. He appealed to the fresh and vivid nature of Mark's narrative, the presence of small details which might go back to an eyewitness (the "cushion" in the boat in 4:35 and the "green" grass in 6:34 are always mentioned here), and to other places where Mark's Greek might be considered as difficult. All these suggest that Mark's account is more primitive.

It must be said that much of this argumentation is worthless (Farmer 1964). The "vivid" nature of Mark's Greek shows us only something of Mark's style, rather than anything about the relative priority of Mark against Matthew and Luke. So too the famous small details could just as well be later additions: later apocryphal gospels are full of such "life-like" features in their narratives.

There are however some instances where a *comparison of the actual texts themselves* makes the theory of Markan priority more plausible than competing theories. In each case one must ask whether the text of one gospel can be adequately explained as a later change from another gospel, or whether the reverse procedure is more plausible. One classic example is Mark 6:5f. = Matt 13:58:

Matthew	Mark
And he did not do many miracles	And he could not do any miracles there, except that he laid his hands on a few sick people and healed them and he marvelled
because of their unbelief.	because of their unbelief.

At the end of the rejection scene in Nazareth, Mark's account appears to suggest that Jesus was powerless (he *could* not do any miracles) and the crowd's unbelief caused Jesus astonishment. In Matthew, Jesus' powerlessness is not mentioned. Matthew simply states that Jesus did not perform many miracles. Also the reason is clearly stated: it is due to the *crowd's* unbelief, not to any deficiency in Jesus. It is easy to see how Mark's version might have been found difficult for a later evangelist and changed to a version like Matthew's. Given Matthew's version it is hard to see why Mark should have wished to change it to his present wording. Thus the theory of Markan priority can give a plausible explanation of the development of the text where the theory of Matthean priority cannot.

Another stock example concerns the wording of Peter's confession at Caesarea Philippi in the three gospels:

Matt 16:16	Mark 8:30	Luke 9:20

You are the Christ, the Son of the living God You are the Christ You are the Christ of God

If Mark's text came first, the development of the tradition seems intelligible: both Matthew and Luke expand the brief Christological confession of Peter in Mark to bring more honor to Jesus. On the other hand, any theory which places Mark after Matthew seems hard to accept. Why should Mark omit Matthew's reference to Jesus as the Son of God here? One should remember that (a) the scene at Caesarea Philippi is clearly of great importance as a turning point in Mark's story, and (b) "Son of God" is a title of immense theological significance for Mark (Mark 1:1, 11; 9:7; 14:61f.; 15:39). Why then should Mark omit it here if it was given to him in (one of) his source(s)? At this point the theory of Markan priority makes good sense of the actual texts where other hypotheses do not.

It is probably true to say that examples of this nature have convinced the majority of scholars today that the theory of Markan priority is the most viable. Clearly such arguments cannot provide incontrovertible evidence. It is always possible for defenders of other source hypotheses to provide scenarios for how and why the secondary evangelists altered their sources in the ways that the hypothesis implies. But until this is done in detail, such hypotheses will fail to carry conviction.

It is admitted by all that the theory of Markan priority is not without problems. Some of these are perhaps more serious than others.

It has been questioned whether the Mark which was available to Matthew and Luke was precisely the same as the canonical gospel we possess. In particular, some critics have suggested that the omissions which Matthew and Luke must have made from Mark could be better explained if they had a copy of Mark (an Ur-Markus) which did not contain these passages.

Such a theory is probably unnecessary. The common omissions by Matthew and Luke can be adequately explained as due to redaction. For example, the note about the charge of Jesus' relatives that Jesus is mad (Mark 3:20–21) could have been felt to be derogatory; the parable of the seed growing secretly (Mark 4:26–29) could be regarded as redundant since Matthew and Luke both have the parable of the leaven to act as a pair with the parable of the mustard seed; the miracle stories of the healing of the deaf-mute and the blind man at Bethsaida (Mark 7:31–37; 8:22–26) could have been felt to be dangerous because of Jesus' use of what could be interpreted as magical techniques. (In any case Matthew may show knowledge of these stories, by having a general summary statement of Jesus' healings at 15:29–31 [the parallel to Mark 7:31–37], and by having two blind men healed in his parallel to Mark's story of the healing of blind Bartimaeus [Mark 10:46–52 = Matt 20:29–34 cf. 9:27–31]). The saying about salt (Mark 9:49–50) may have been unintelligible, and in any case Matthew and Luke appear to have a similar saying from another source (Matt 5:13 = Luke 14:34); the episode of the flight of the naked young man at Jesus' arrest (Mark 14:51) may have been regarded as irrelevant.

This covers almost all of Matthew's omissions from Mark. There is a considerably larger quantity of material which is in Mark but not in Luke, notably the section Mark 6:45–8:26. (Cf. Streeter: Luke had a mutilated copy of Mark. Note however that any Ur-Markus theory here would not meet the facts: one would have to posit an Ur-Markus used by Matthew and a quite different Ur-Markus used by Luke!) However, it seems likely that many of Luke's omissions from Mark can be satisfactorily explained as due to Luke's own redaction. Some of the omissions may be due to the fact that Luke had a parallel version of the same tradition and preferred to use that instead (cf. the parable of the mustard seed Mark 4:30–32, Luke 13:18–19). Some of the material in Mark but not in Luke may have been of less interest to Luke's gentile audience (e.g., the long discussion about purity in Mark 7:1–23). Other material may have been omitted as redundant (the feeding of the 4,000 [Mark 8:1–10] after the very similar story of the feeding of the 5,000 [Mark 6:31–44]). In all there seems no need to postulate that Luke had available to him a version of Mark which was significantly different from our present canonical version.

Another feature which has been felt to constitute a difficulty for the theory of Markan priority is that of the so-called "duplicate expressions" in Mark, where Mark has two almost synonymous expressions side by side, and where Matthew has just one half and Luke the other. The most famous example is Mark 1:32 and pars.:

Matt 8:16	Mark 1:32	Luke 4:40
When evening was come	When evening was come	
	and the sun was setting	When the sun was setting

Although this phenomenon has been used to argue in favor of Markan priority (Matthew and Luke simply cut out Mark's redundancy: Streeter), others have felt that the phenomenon constitutes a major problem for the theory. Why should Matthew and Luke so conveniently choose to pick the half of the double expression which the other omits? Hence neo-Griesbachians would argue that the texts can be best explained as due to Mark's conflating his two sources (Farmer 1977; Dungan 1970).

The evidence is probably indecisive. Neirynck (1972) has shown that "duality" is a stylistic feature of Mark's Greek, and is far more wide-ranging than those instances which could be explained as conflation of Matthew and Luke. Further, there are a number of instances where Matthew and Luke retain the same half of a Markan duplicate expression. The whole argument is very similar to the problem of the choice and order of material, but in both cases, the number of instances where Matthew and Luke provide this kind of alternating support for Mark is not statistically significant enough to question the assumption that Matthew and Luke have used Mark independently (Tuckett 1983; 1984).

Perhaps the greatest difficulty faced by the theory of Markan priority concerns the so-called "minor agreements." At the level of order it is true that Matthew and Luke never agree against Mark. At the level of the detailed wording within pericopes the same remains broadly true. Nevertheless, there are a number of instances where Matthew and Luke do agree with each other against Mark. These texts are called the "minor agreements," and clearly constitute an anomaly for the theory of Markan priority. An occasional instance where Matthew and Luke had independently altered Mark in the same way would not be unexpected; yet the number of instances where this must have occurred (assuming Markan priority) is felt by many to be uncomfortably high.

Once again an abstract approach can perhaps be misleading, and one should consider the actual minor agreements themselves. Several agreements are scarcely surprising as independent changes of Mark's Greek. Mark often uses the present tense in his narrative to describe the events of the past (the so-called "historic present"); Matthew and Luke use the aorist tense much more frequently. It is therefore not unexpected that Matthew and Luke regularly change Mark's historic present to an aorist, and quite often do so at the same place, thereby creating a minor agreement (e.g., Mark 2:5 and pars.). So too Mark often connects sentences with the word "and" *(kai),* a usage which is as clumsy in Greek as it is in English. Matthew and Luke regularly "improve" this by changing *kai* to *de.* Again it is not surprising that they sometimes do so at the same point and thereby create a minor agreement (cf. Mark 2:24 and pars.). Neirynck has in fact shown that a vast number of the minor agreements can be explained in this way: on the theory of Markan priority, they involve changes to the text of Mark by Matthew and Luke independently, and there are numerous other instances in the tradition where Matthew and Luke must have made the same kind of change (again assuming Markan priority) but without necessarily agreeing with each other (Neirynck 1974).

Other agreements may be explicable in other ways. In some instances, it may be that the Markan tradition overlapped with another tradition available to Matthew and Luke (i.e., Q). The agreement between Matthew and Luke may thus be due to the influence of this Q version. The influence of Q may explain minor agreements in the parable of the mustard seed, the Beelzebul controversy, and the Temptation story. Indeed the agreements between Matthew and Luke are so extensive (and it is only because they are so extensive that one postulates a parallel, non-Markan version) that these texts are often called "major agreements." They really constitute a separate category and cause no difficulty for the Two-Source theory provided one accepts the possibility in principle of overlapping sources.

Some agreements may be explicable as the result of textual corruption. (Streeter appealed extensively to this, and his argument has been heavily criticized; Farmer 1964. It is widely agreed that such an explanation cannot be as widely used as Streeter claimed.) In the course of the transmission of the text, it would be inevitable that scribes copying the text of one gospel would sometimes let the wording of a

parallel version influence them (whether consciously or unconsciously). Since Matthew's gospel was the most popular in antiquity, it is not surprising that in several manuscripts of Mark and Luke, the wording has been assimilated to Matthew's text. Thus if a text in Luke was assimilated to the Matthean wording, this might create the impression of a minor agreement against Mark. How far one may invoke this argument to explain the minor agreements is disputed; Streeter probably went too far. However, there are some occasions when the uncertainty of the precise reading of the gospel texts makes it doubtful whether there really was a minor agreement originally. For example, in many printed editions of Mark 9:19 and pars. there is a minor agreement:

Matt 17:17	Mark 9:19	Luke 9:41
O faithless and perverted generation	O faithless generation	O faithless and perverted generation

Yet the extra words "and perverted" *(kai diestrammenē)* are present in some manuscripts of Mark (including P^{45} W); they are also absent from a few witnesses to the text of Luke (e Marc). There must therefore be an element of doubt whether there originally was a minor agreement here (McLoughlin). The apparent agreement between Matt 26:75 and Luke 22:62 against Mark 14:72 (in saying that Peter "went outside" and wept "bitterly") may also be explicable on textual grounds, since the verse in Luke may not have been part of Luke's original text: the verse is omitted in a few mss and it also makes for some internal lack of cohesion between v 61 and v 63 (Tuckett 1984a).

The most famous of all the minor agreements concerns the mockery of Jesus by the soldiers.

Matt 26:68	Mark 14:65	Luke 22:64
Prophesy to us, Christ! Who hit you?	Prophesy!	Prophesy! Who hit you?

The extra question, involving five words in Greek *(tis estin ho paisas se)* common to Matthew and Luke, is not easily explained as due to the influence of a parallel tradition or to independent redaction. The most satisfactory explanation on the theory of Markan priority is to assume that the extra words constitute a textual corruption in the text of Matthew, due to assimilation to the Lukan version. The question makes good sense in the Lukan context where Jesus is blindfolded, but little sense in the Matthean context where Jesus is not (Streeter 1924, McLoughlin 1967). The obvious weakness of the theory is that there is no ms evidence for a text of Matthew not containing the words. The theory thus involves postulating a primitive corruption of the Matthean text which has affected all known mss. Such a theory is thus easy to ridicule but is not inherently impossible (Neirynck 1987).

Although the minor agreements clearly constitute a problem for the theory of Markan priority, it is by no means clear that the same texts can be explained any better by other hypotheses. The theory of Goulder (1978), which postulates some reminiscences by Luke of Matthew's gospel, faces difficulties precisely because the agreements are so minor. Why should Luke have allowed Matthew's text to influence him in such a minor way as to create these small agreements, but rarely in any major way?

The Griesbach hypothesis fares little better. Here the minor agreements have to be explained as due to Mark's own style causing him to alter the text of his two sources at some points where they agree. This is feasible in general terms, but becomes problematic when applied to specific texts (Tuckett 1983). For example, it becomes difficult to see why Mark should have deliberately omitted the mocking question "Who hit you?" if it stood in both his sources. Can such an omission be "stylistic"?

One other factor has been brought into more recent debates by neo-Griesbachians. This concerns the patristic evidence about the synoptic problem. Many of the Church Fathers appear to assume that the chronological order of the gospels is the same as the canonical order. They all agree, for example, that Matthew's gospel was written first. Further, there is one statement ascribed to Clement of Alexandria (who in turn is claiming to be reproducing earlier testimony) to the effect that gospels with genealogies were written first (Eus. *Hist. Eccl.* 6.14).

The value of such evidence is very uncertain. The evidence of Clement is quite isolated and can scarcely bear much weight in supporting the Griesbach hypothesis against the claims of the Augustinian hypothesis. But even if we could determine what the Church Fathers believed, it does not solve the problem of whether they were right, and we can only establish that by considering the internal evidence of the gospel texts themselves. It is thus doubtful if the patristic evidence can help in the solution of the synoptic problem today.

In conclusion, we may say that, although it is not without problems, the theory of Markan priority remains the most adequate solution of the synoptic problem in relation to the so-called "triple tradition," those parts of the tradition common to all three gospels.

C. The Q Source

Agreements between the gospels are not confined to passages where there is a Markan parallel. Frequently Matthew and Luke alone agree, and at times that agreement is extremely close (Matt 3:7–10 = Luke 3:7–9) On the Two-Source theory, this agreement is to be explained as due to dependence by Matthew and Luke on non-Markan common source material usually known as Q. However, others have questioned this, claiming that Q is an unnecessary hypothesis, and that the agreements between Matthew and Luke can be explained as due to direct dependence of Luke on Matthew. Supporters of the Griesbach hypothesis claim that Luke is dependent on Matthew alone. Others maintain the theory of Markan priority but would wish to explain the agreements in the "double" tradition (parts of the tradition where Luke is parallel to Matthew) as due to Luke's knowledge and use of Matthew (Farrer 1955; Goulder 1974).

The case for the existence of Q, like the case for Markan priority, is a cumulative one. It is also in some sense a negative one, since the Q hypothesis is essentially the alternative to the possibility that Luke knew Matthew. (The theory that Matthew knew Luke is hardly ever proposed today.) If Luke did not know Matthew, the only real alternative theory is that both evangelists depend on common source material.

The first factor to be considered is the order of the material in the double tradition. This material appears in widely differing orders in Matthew and Luke. If Luke knew Matthew, why has he changed the Matthean order so thoroughly, disrupting Matthew's clear and concise arrangement of the teaching material into five blocks, each concerned with a particular theme? Neo-Griesbachians have rarely attempted to provide such a detailed explanation (only Orchard 1976, on which see Tuckett 1983). The problem becomes all the more pressing if one also maintains the theory of Markan priority (Farrer 1955; Goulder 1974). In this case, it is assumed that Luke knew and used Mark in the triple tradition. But Luke has made very few changes to the Markan order. Why has Luke behaved so conservatively with the order of one of his sources (Mark), and with such freedom in relation to the order of his other alleged source (Matthew)? This radical difference in the way Luke must have used his sources seems so unlikely to many, that it is more probable that Luke did not know Matthew and that both depend on common tradition for the non-Markan material which they share. Further, insofar as this tradition may come from a single source Q, the fact that Luke has preserved the order of his Markan source almost unaltered, whereas Matthew has rearranged the Markan material in the interests of his thematic arrangement, suggests that the same has probably happened in the case of Q. Thus, most today assume that Luke has preserved the order of Q more faithfully than Matthew.

Further considerations of order can strengthen the Q hypothesis. V. Taylor has shown that, although at first sight there appears to be little correlation in order in the Q material in Matthew and Luke, the situation is different if one bears in mind Matthew's general aim of collecting together like materials into a thematic arrangement. If one takes the five Matthean discourses in turn, and compares the order of the Q material within each discourse with the corresponding material in Luke, then there is a striking agreement in the relative order (Taylor 1959). Such a phenomenon is hard to explain on other hypotheses.

Further evidence against the theory that Luke knew Matthew is provided by the fact that Luke never seems to be aware of Matthew's modifications to Mark in Markan material. Sometimes Matthew makes significant additions to Mark (e.g., Matt 12:5–7; 16:16–19), yet Luke never betrays any knowledge of these Matthean additions. Such a state of affairs is hard to square with the view that Luke knew Matthew as well as Mark. (It is in itself less of a problem for the Griesbach hypothesis: such "omissions" by Luke

are simply due to Luke's redaction and the fact that they are not in Mark either is then due to Mark's subsequent editorial decision to omit them too, perhaps because he is following a policy of including only material common to both his sources.)

Another relevant factor in this discussion is that quite often in double-tradition material, Luke has a form of the tradition which appears to be more primitive than Matthew's (e.g., in some of the Beatitudes Matt 5:3,6 = Luke 6:20f.; in the form of the doom oracle as a saying of Wisdom in Matt 23:34 = Luke 11:49; in the shorter version of the Lord's Prayer Matt 6:9–13 = Luke 11:2–4; in the form of the saying about the Sign of Jonah Matt 12:40 = Luke 11:30). If Luke is dependent on Matthew at every point, then Luke's version should always be secondary to Matthew's. Insofar as this is not the case, the theory of Luke's knowledge of Matthew is weakened.

Such results can be incorporated within an overall theory of Luke's knowledge of Matthew. It may be that Luke knew Matthew but only used Matthew very occasionally. Some neo-Griesbachians have argued that although Luke knew Matthew, Luke sometimes had access to parallel but independent versions of the same tradition (Farmer 1975 concerning some of the parables). However, if this theory is extended too far, so that Luke is supposed to be dependent on traditions parallel to Matthew for too much of the tradition, then the theory becomes almost indistinguishable from the Q hypothesis.

A final argument for the Q hypothesis arises from the fact that Matthew and Luke have a number of doublets, two versions of basically the same saying, one version of which has a parallel in Mark while the other does not; for example, the saying about cross-bearing appears in Matt 16:24 = Mark 8:34 = Luke 9:23 and also in Matt 10:38 = Luke 14:27. This phenomenon can be easily explained on the basis of the Two-Source theory: one version of the saying is due to dependence on Mark, the other comes from the Q tradition.

This final argument illustrates very well the fact that at times the two basic streams of tradition postulated by the Two-Source theory, Mark and Q, must have overlapped. Advocates of the Two-Source theory would claim that such overlap occurs not only in isolated sayings, but also in whole pericopes such as the Temptation narratives, the Beelzebul controversy, the parable of the mustard seed, the mission charge and perhaps elsewhere.

Such a theory is felt by many to be a possibly fatal weakness of the Two-Source theory. In any case it must mean that the "Q tradition" cannot simply be defined as "tradition common to Matthew and Luke but not in Mark." Nevertheless, the theory that some parts of the gospel tradition were preserved in more than one strand is not inherently unlikely.

In fact, it is paradoxically precisely these "overlap" passages which provide strong arguments against source hypotheses *other* than the Two-Source theory. In most of these overlap passages, advocates of the Two-Source theory would argue that Luke has generally preserved the Q version, Mark has his own (independent) version, and Matthew conflates the two. (The Beelzebul story and the parable of the mustard seed are examples; other instances are perhaps more complex.) Such texts can be explained quite easily in this way. But the same texts look decidedly odd when viewed from the perspective of other hypotheses. For example, if one retains the theory of Markan priority and dispenses with Q (Farrer 1955; Goulder 1974), then Luke's procedure here must have been very strange. Mark must have written first, Matthew then adding to Mark. Luke, who usually follows Mark and ignores Matthew when they run parallel, must have decided here to remove very carefully all the Markan material from Matthew, retaining only the parts peculiar to Matthew. Such a procedure is so unlike Luke's alleged procedure elsewhere in the tradition that it seems easier to discard the inital premiss (Downing 1965). The Griesbach hypothesis shares a similar fate. Matthew must have written first; Luke, writing second, must have reproduced only some parts of Matthew. Then Mark, writing third, must have taken an aversion to anything which Luke had taken from Matthew and so reproduced only those parts of Matthew which Luke had omitted. Such a procedure is so unlike what has been claimed to be Mark's overall aim of reproducing precisely what *was* common to both his sources. Again it seems easier to discard the initial premiss (Tuckett 1983). Thus the overlapping texts, far from providing problems for the Two-Source theory, in fact strengthen it considerably.

The agreements between Matthew and Luke in double tradition material are thus probably best explained by dependence on common source material Q. The further problems associated with this theory—how far we should be thinking of Q as a single source, or whether we should be thinking only of an amorphous mass of material which was never combined prior to its incorporation by Matthew and Luke—will be discussed elsewhere (see Q). Such problems do not affect the basic theory that the Matthew-Luke agreements in double-tradition material are not to be explained by Luke's knowledge of Matthew.

D. The Sources M and L

Matthew and Luke also have further material peculiar to their gospels alone. This material is usually referred to as "M" and "L" respectively. How far any of this material can be traced back to written sources is unclear. Streeter postulated further documents relating to these strands of the tradition and proposed a "four-document hypothesis" (corresponding to the four basic strands of the tradition: Mark, Q, M, and L). This must however remain speculative. The question whether it is appropriate to talk of Q as "document" will be discussed elsewhere.

In the case of M material, some have appealed to its strongly Jewish-Christian nature (Matt 5:17–20; the formula quotations). However, it may well be that much of this material is due to Matthew himself, and the "Jewishness" of the material may simply be a reflection of the author of the gospel.

In the case of L material, many have suggested a "proto-Luke" theory (Streeter 1924; Taylor 1926). This is the theory that Luke wrote a first draft of his gospel combining the Q and L material together, and that later he added the Markan material. This theory can appeal to the fact that Luke does sometimes interweave Q and L material, but he tends to keep Q+L and Markan materials separate in large blocks. This would be well explained if the Markan material was added subsequently to an already existing document. Further, it seems likely that Luke had a separate (non-Markan) source for his passion narrative. It is striking here that the measure of verbal agreement between Luke and Mark drops sharply when compared with the rest of the tradition; also there are a large number of small differences in order between Luke and Mark (e.g., the mockery of Jesus comes after the Jewish hearing in Mark, before in Luke; the rending of the temple veil comes after Jesus' death in Mark, before in Luke). Given Luke's generally conservative treatment of Mark elsewhere, it seems quite plausible to postulate that Luke had access to an independent account of the passion narrative. This would also fit in with a proto-Luke theory.

However, while the theory of an independent passion narrative clearly fits a proto-Luke theory, it in no way demands it. Luke certainly contains large, non-Markan, blocks of material in 6:20–8:3; 9:51–18:14; 19:1–27. But there is no certainty that these ever formed part of an earlier full-length gospel. Further, 3:1–4:30, sometimes ascribed to proto-Luke, betrays Markan influence as well (Luke 3:4; 3:21f.; 4:1f.; 4:24) and hence there is no clear beginning to the alleged proto-Luke. Thus the whole proto-Luke theory remains rather doubtful, and in fact has convinced few scholars outside England. In any case, it is doubtful if much can be gained by postulating a proto-Luke prior to canonical Luke. Certainly it cannot guarantee the historical reliability of Luke's gospel as Streeter and Taylor thought: the sources of the tradition remain the two basic strands of Q and L.

E. Conclusion

The Two-Source theory probably offers the most adequate (or least problematic) solution to the synoptic problem. It is not free from difficulties and it can never be proved with mathematical finality. Many arguments used in the discussion are reversible. Practically all arguments depend on claims to the effect that a development of the tradition in one direction is "more likely" than the reverse development. Clearly, any such claim is subjective, and always potentially open to a counterclaim which tries to account for the opposite change in question. Thus the most one can say is that the Two-Source theory provides a reasonably comprehensive account of the development of the tradition on the basis of its main tenets of the dependence of Matthew and Luke on the Markan and Q traditions.

The synoptic problem is of very considerable importance in a number of fields. Older scholars perhaps thought too quickly that the isolation of the older strands of the tradition take us straight back to the historical Jesus. Wrede's work on the messianic secret in Mark and theories of a theology of Q show that

the earliest sources may still leave us some distance removed from Jesus. Nevertheless, a solution to the synoptic problem is essential if we are to reach back to earlier parts of the tradition. The synoptic problem also lies at the basis of a great deal of redaction-critical study of the gospels. Much of this study presupposes the Two-Source theory, seeking for example to illuminate Matthew's and Luke's theologies by examining the changes Matthew and Luke have made to their sources. Any different theory of synoptic relationships may well entail a drastic alteration in our assessment of the theologies of the individual evangelists.

SYNTYCHE (PERSON) [Gk *Syntyche* (Συντυχε)]. A member of the Christian community at Philippi whom Paul entreats to reach "agreement in the Lord" with another member, Euodia (Phil 4:2–3). The two had apparently quarreled, but the nature of their differences is not specified.

While the name Syntyche is in the feminine form in the Greek text, as it is in numerous inscriptions where the same name occurs, it has been asserted, e.g., by Theodore of Mopsuestia, that this person was a male. Theodore claimed to have heard that Syntyche ought to have been spelled as the masculine Syntyches, and that "he" was actually the jailer at Philippi (cf. Acts 16) and the husband of Euodia. But there is no substantiation for what Theodore had learned by rumor and no textual evidence to support it (Hawthorne *Philippians* WBC, 179). Furthermore, the use of the Greek feminine plural pronouns *autais* and *haitines* in 4:3, which can only refer back to Syntyche and Euodia, requires that both names belong to women.

Not only has Syntyche's gender been questioned, but also her individuality. On this and further speculation concerning her significant role in the Philippian community, see EUODIA.

SYRACUSE (PLACE) [Gk *Syrakousa* (Συρακουσα)]. A Greek city on the SE coast of Sicily (37°07′N; 15°11′E) where Paul's ship put in for three days on the voyage to Rome after having been shipwrecked on the island of Malta (Acts 28:12). The long stay of three days could be attributed to wind conditions or to the unloading and loading of cargo (Haenchen 1971:718). The city is situated at the edge of the great south Sicilian limestone formations. Originally only on the small island of Ortygia, right off of the coast of Sicily, the city eventually grew and spread to the mainland. At first the island was connected to the mainland by a dam but later a bridge was built.

According to Thucydides (6.3.2; see also Strab. 6.2.4) Syracuse was founded by Archias from Corinth one year after Nexos was founded (734 B.C.). At first Syracuse was ruled by land proprietors or *gamoroi,* those who divide the land (Finley 1979:18). The city prospered under its tyrants Galon and his brother Hieron who succeeded him (ca. 485–467 B.C.). In 413 B.C., Syracuse was besieged by Athens and the Athenian armies were defeated. This marked the turning point in the Peloponnesian War. Eventually the city was taken by Marcellus in 212 and became a Roman province. (A more extensive survey of Syracuse' political history can be found in PW 8:1478–1535.)

At the time of Paul's visit, Syracuse was still a very prosperous city. Cicero (106–43 B.C.) gives an extensive description of the city and calls it the richest and fairest city in all of Sicily, strong and beautiful to behold (Cic. *Verr.* 2.4 115–19). Two harbors are found in the city, a large one on the mainland and a small one on the island.

A few remains of ancient Syracuse are still in existence. The temple of Apollo and a Roman amphitheater are on the mainland; the temple of Athena on the island was built into the Church of Santa Maria delle Colonne along with a number of early Christian catacombs. On the W side of the island there is still the fresh water spring called Arethusa.

ARNOLD BETZ

SYRIA (PLACE) [Heb *ʾaram* (אֲרָם); Gk *Syria* (Συρια)]. SYRIAN. In the Bible, Syria is usually used to designate the areas associated with the ancient city-state of Damascus, also known as Aram. Extensive discussions of the relationship between Syria and biblical Palestine to its S and W will therefore be found under ARAM (PLACE) and DAMASCUS (PLACE). This entry consists of two articles that focus upon the archaeological record of human occupation of ancient Syria: the first surveys the prehistoric period, and the second surveys the Bronze and Iron Age periods.

PREHISTORIC SYRIA

Up until the 20th century the term Syria designated a natural geographic area *(Bilad al-Cham)* between the Sinai to the S, the Mediterranean to the W, the Taurus mountains to the N, and the Syrian desert to the E. This region never knew (except during Roman domination) real political unity. We will refer here to the limits of the present-day state of Syria, excluding, by consequence, the bordering states of Israel, Jordan, and Lebanon.

Currently three clear and distinct climatic zones divide Syria: one, to the W, is littoral Mediterranean, a temperate climate separated from the interior by the Alaouite mountains which continue to the N in Lebanon and AntiLebanon. In the opposite direction, its desert-like SE border receives less than 200 mm of rain per year but is crossed by the Euphrates and dotted with several oases (Palmyra, El Kowm). Lastly, between these two zones, a semiarid band of intermediary climate inscribes an arc that begins in the Jezireh, between the middle branches of the Euphrates and the Tigris, continues through the steppes of the Aleppo region and the Damascus oasis, and extends further S, then out of Syria to the boundary of Jordan. This zone, of which the climatic vegetation is a steppe-forest of oaks and pistachio trees, is also characterized by wild grains that made this the "nuclear zone" (Braidwood), where the first agricultural experiments were carried out in the Near East during the Neolithic period.

A. History of Research

Human occupation of Syria in prehistoric times is really known only from research done since 1950. Of course, the first prehistoric studies of the Levant began at the end of the 19th century, but at first only concerned Lebanon, based upon research of St. Joseph University and the American University in Beirut. Beginning in 1920, Palestine, under British mandate, was studied under the direction of the Englishwoman D. Garrod and the Frenchman R. Neuville. In Syria itself, excavations only began between 1930 and 1933 by a German, A. Rust. The rock shelter of Jabrud, published in 1951, provided evidence for the end of the Lower Paleolithic Period and the Middle and Upper Paleolithic. Immediately before World War II, the first research on Neolithic Syria was carried out by the German M. von Oppenheim at Tell Halaf, in upper Mesopotamia, and above all by an American team from the University of Chicago in the plain of Amuq, near Antioch. R. J. Braidwood, who directed this excavation, was the first in the Near East to have included in his team not only archaeologists but also natural scientists, inaugurating "multi-disciplinary" methods currently in use everywhere.

At Tell Halaf as well as in the Amuq plain, one finds only a relatively late Neolithic period, not before the 6th millennium and devoid of ceramics. An older "pre-ceramic" Neolithic period was only known in the Levant by discoveries of J. Garstang between 1930 and 1936 in the lowest levels of Jericho in Palestine. It was necessary to wait until the 1960s for the French archaeologist H. de Contenson to begin excavating in Syria itself on the littoral as well as at Ras Shamra, at the oasis of Damascus, Tell Ramad, and Tell Aswad, which are all pre-ceramic Neolithic occupations going back to the 7th millennium. At the same time, the University of Tokyo inaugurated a vast program of survey and excavations in the Levant Paleolithic that led to ongoing work in the Palmyra region, and to the discovery of Latamne, the oldest Paleolithic site known in Syria.

The research has not stopped since 1970:under the impetus of F. Hours and P. Sanlaville the survey of Paleolithic sites extends from the coast of Syria, to the Oronte and Euphrates valleys and to the desert oasis of El Kowm. On the other hand, the construction of the huge Tabka dam on the Euphrates was the occasion, thanks to an "international salvage campaign" of sites threatened with flooding, for a discovery of real importance for the origins of the agriculture and the Neolithic period in the Near East. The excavations by J. Cauvin at Mureybet and Cheikh Hassan and those of A. Moore at Abu Hureyra and of the University of Amsterdam in Buqras have, from 1970–76 entirely renewed our knowledge of this subject.

All these digs, as well as the progress of 20 years of techniques and absolute dating by carbon 14, allow us to present a fairly accurate picture of Syrian prehistory.

B. Paleolithic Period

As it forms the occidental front of Asia, but also the N extension of the Arabic Peninsula (or Africa), Syria constitutes an obligatory passage between two continents. This had an importance from the beginning of its human population: it is known to be in Africa that the human species emerged, 2.5 million years ago, and that it is from there that later *Homo erectus* began to spread throughout the rest of the world. It is thus not surprising that Syria shows traces of particularly ancient occupation, going back, according to the present state of our knowledge, a million years.

It is during this period that several rare tools of worked flint were found on the terraces of northern Nahr-el-Kabir, at *Sitt Markho*, or from the Oronte, at *Khattab*, near Latamne. These crude pieces are the only vestiges of what is called the "Early Lower Paleolithic" period. Beginning at 600,000 years B.P.,

during the Middle Lower Paleolithic period, tools are more abundant and derive from biface industries that are called in Europe as in Africa, "Acheulean." The handaxes found there are large and lance-shaped. The most important site is that of Latamne, on the Oronte, because a real habitation has been found there; however, artifacts of the same period have been found on the surface in several locations near the Oronte, the Euphrates, Nahr-el-Kabir, and on the coast. This period also sees the birth of a particular technique for knapping flint, called the "Levallois technique," that allowed the extraction of flakes, of which the contour was already predetermined, by a preliminary preparation of the core.

Between 250,000 and 150,000 B.C., at the end of the Acheulean, the handaxes become smaller and lighter, the tools obtained by the Levallois technique increase in number, and the layers also become more numerous. The valley of the Oronte at Gharmashi and the oasis of El Kowm provided places of true habitation.

The transition toward the Middle Paleolithic period takes place between 150,000 and 90,000 B.C. It is represented by an original culture, the Jabrudian that owes its name to the site of Jabrud in the Qalamoun mountains, but that is above all known today by about ten sites discovered in the El Kowm oasis. There are still several handaxes there, but the most numerous tools are the scrapers. Around 100,000 B.C. other cultures appear (the Hummalian, the Levalloiso-Mousterian) that for a certain time characterize different regions in Syria. But only the Levalloiso-Mousterian, characterized by points and side scrapers produced by the Levallois technique, occupied the entire Syrian territory during the Middle Paleolithic period, that is to say between 90,000 and 40,000 B.P.

Strangely, despite the intensity of site surveys, up until now only a few Late Paleolithic sites have been found in Syria. This is the case for the period that is called elsewhere (in Lebanon and Israel) the "Aurignacian of the Levant." Syria is more heavily occupied at the end of the Late Paleolithic period, by the Kebarian civilization which is often considered to already belong to the Epi-Paleolithic period.

C. The Last Epi-Paleolithic Hunter-Gatherers and the Origins of the Villages

At the end of the Paleolithic period, about 16,000 B.C., the "Kebarian" culture was implanted in the Levant; it is characterized by the miniaturization of flint tools. These "microliths" served as the cutting edge for a whole scale of varied instruments of which the haft was of wood. Around 12,000 B.C. the microliths take geometric and stereotypic forms (triangles, trapezoids, rectangles). This is the "geometric Kebarian" present in all the Levant, the littoral as well as the desert areas. The Syrian oasis of El Kowm, near Palmyra, shows a remarkable density of layers from this period where small groups of hunters, still very mobile, located their encampments near places of water.

It is also during this period that a progressive warming of the climate allowed the natural diffusion of wild cereals in the entire semiarid area, halfway between the desert and the Mediterranean climate of the coast. Thus wild grains (wheat, barley), even before becoming "domesticated," came to play an important role in human diet. It is in this "nuclear" zone that the first phases of the "Neolithization" process took place; that is to say, first the sedentarization of villages, then the apprenticeship of agriculture.

A new culture, the Natufian, occupied in effect the entire Levant from the Nile to the Euphrates between 10,000 and 8200 B.C. Most of the geometric microliths were now of lunate form. The Natufians, like the Kebarians, were "predators" living principally on wild resources. But it is to them that we owe the first sedentary villages known in the Near East: these were small agglomerations of 200 to 300 square meters, made up of round houses half buried in pits in the earth, and henceforth were occupied on a permanent basis by social groups that were larger than previous ones. The village of Mureybet on the middle Euphrates in Syria was founded by Natufians around 8500 B.C.: its setting was characteristic of the ecological options of this culture, to assure sufficient resources for the entire year without recourse to "nomadism." One thus finds fish and shells from the river, wild grains and game (gazelles, equids) from the surrounding steppe, and game from the wooded borders of the Euphrates (boars, deer, bovids, migratory birds). All of this points to a very eclectic economy, usually called a "wide spectrum" economy.

D. The Beginnings of Agriculture in the 8th Millennium

The first agricultural experiments took place, in this already sedentary milieu, during the first half of the 8th millennium. The oldest traces of this grain culture appear in Palestine, at Jericho and Netiv Hagdod, and in Syria in the region of Damascus, at Tell Aswad, and on the middle Euphrates, at Mureybet. Of particular interest here is to pinpoint this phenomenon within a continuous evolution, unbroken since the village had come into existence a millennium earlier; when around 7800 B.C. the study of pollens showed the first artificial concentrations of grains (concentrations that define the "fields") at Mureybet, which in its phase III, had just attained its full demographic and cultural flowering. Like the nearby and contemporaneous site of Sheikh Hassan, its settlement area reached three hectares. It is a crowded web of round habitations, currently divided in the interior by rectilinear partitions; while around 7700 B.C. the first structures constructed entirely with a rectilinear plan appear, probably used as silos. Special Neolithic innovative techniques such as baked clay or polished stone, were already present but still marginal and reserved for prestigious and cultural uses. The stone tools, where the Natufian microliths have disappeared, increase in number of arrowheads and sickle blades. A very diversified bone industry also accompanies them.

This cultural flowering is accompanied by a profound economic transformation; the proto-agricultural practices become part of a more general plan of alimentary strategy, more selective and better organized than before: fishing, so important in the Natufian period, almost disappears, and hunting centers around the large grass eaters (cattle and wild equids). These practices which express a choice in the resources exploited and the abandonment of certain others, allows one to refute the hypothesis of an agriculture that was invented in the Near East to respond to insufficient wild resources which was the result of growing human populations. By the same token, it is during this period that the early agriculturalists of Palestine built the first monumental architecture at Jericho, implying cooperation and collective work. It is to this new set of activities, required by larger communal groups, that one must attribute the first steps in "subsistence production." However, the "principal cause" of this change seems to be more sociological than ecological. This change also had consequences in the ideological and religious domain. Natufian art was essentially theriomorphic, but that of Mureybet III is almost entirely anthropomorphic. At about 8000, the first known feminine figurines of the Near East are found at Mureybet, made of stone or baked clay. These symbols of the "Mother Goddess" will spread over an increasingly larger area throughout the Near and Middle East and the Prehellenic Mediterranean. A bull cult is also inferred at Mureybet from the frequent insertion of horns or ox skulls in the walls of the houses; similarly, this cult will proliferate through the Phoenician "Baals" and the Minoan religion into classical Greece.

E. The Villages of Rancher-Farmers of the 7th Millennium

In the 7th millennium, Syria, like the rest of the Levant, is occupied by a new civilization, the "PPNB" (Prepottery Neolithic B), that grew up around the middle Euphrates beginning in the second half of the 8th millennium through progressive transformations from the culture of Mureybet III. Phase IV of Mureybet and the village of Abu Hureyra, also on the Euphrates, furnish us with even older examples.

The habitations are now all rectangular and have several rooms with floors often coated with lime or gypsum plaster. The villages practice not only farming but also raise small livestock, although hunting still plays an important role in their diet. The tools remain basically arrows and sickles, although polished axes are now in current use. Ceramics, however, are still not common, but at the end of the 7th millennium vessels made from lime or gypsum plaster will appear, known by the name of "white ware." The Neolithic sites of Ramad, Buqras and El Kowm are part of this more elaborate phase of the culture, and date from about 6000 B.C.

The preceramic village of Ramad, occupied from 6250 to 6000 B.C., covers three hectares, and lies 20 km to the south of Damascus, at the foot of Hermon. The rectilinear houses with floors covered with lime plaster walls of mudbrick and stone bedrock, are aligned along the small streets. Their inhabitants grew not only grains (wheat, barley) but also flax for linen and raised sheep. It is interesting to find at Ramad, in the religious domain, a true "cult of ancestors," attested by human skulls with face modeled over it in lime plaster in the image of the living person and attached to figurine supports made from clay. This cult is found at most of the PPNB sites from the Euphrates to Palestine. It seems to show, at a moment when

the fully sedentary group of humans turned their attention to the domestic animal and plant species and passed fields and flocks down from one generation to the next, a new sense of the continuity and filiation of human life.

A second important event from the end of the 7th millennium also results from the full mastery of agricultural and husbandry techniques. At first restricted to the "nuclear zone" of the steppe where the first agricultural experiments were carried out (dry farming), Neolithization allowed human groups to go further than this initial ecological limit: this expansion takes place simultaneously toward coastal Syria and toward the interior desert zone, the former too humid and the latter too arid for the grains to grow spontaneously. On the coast, the site of Ras Shamra-Ugarit was occupied from 6500 B.C. by Neolithic agriculturalists. In the desert, this is represented by the reoccupation, around 6200 of the El Kowm oasis, abandoned by man since the end of the Paleolithic period; it also formed around 6400 B.C., the foundation of Buqras.

Buqras is located on the right bank of the Euphrates, 40 km downstream from the present Deir-ez-Zor. It is also a large village of three hectares of closely knit, several-roomed houses with walls of mudbricks and floors covered with gypsum plaster. These houses are served, like at Ramad, by several streets. The inhabited rooms, long and narrow, communicate with one another through very small doors, while other constructions, divided into small, noncommunicating cubic cells, served no doubt as places to store food. A developed art attests to the high cultural level attained by the village: painted frescos representing ostriches and numerous human and animal figurines in stone or baked clay are found. A small number of painted ceramics appear in the upper layers, but the greatest number of artifacts are of polished stone or of gypsum plaster ("white ware"). The Neolithic village of El Kowm contains similar architecture with also, around 6000 B.C., an enormous quantity of white ware.

The economy of these two desert sites, both outside the limits of "dry farming," was based not only on raising goats and sheep and on a large quantity of hunting, but also on elaborate farming, where several species of grains were cultivated despite the dryness of the climate. This was possible through a selective use of fertile ground bordering the Euphrates (Buqras) or near springs (El Kowm), but also, probably, by the use of primitive irrigation techniques.

A last important event probably also took place during the same period as the late PPNB. Outside of the sedentary farming villages previously described, traces of contemporary installations left by nomadic groups are believed to have been found. These groups could have been the first ancestors of the present-day Bedouins of the Near East.

F. Ceramic Civilizations of the 6th and 5th Millennia

After 6000 B.C., the process of "Neolithization" of Syria was thus complete. The constitutive elements of what is generally understood to be "Neolithic" are completely developed: the life of villages, the domestication of plants and animals; the new cults, and also the specifically acquired techniques such as stone polishing and ceramics manufacture. Ceramics, the last of these acquisitions, will now serve, thanks to its variety of forms and decorations, to differentiate various civilizations.

The Syrian littoral in the 6th millennium is the epicenter of a cultural trend of lusterware, called Dark Face Burnished Ware, identified on the Antioch plain (Amuq A–B), at Ras Shamra VB and also found in more recent layers (phase III) of Ramad.

On the contrary, Upper Mesopotamian Syria (Jezireh), along the tributaries of the Euphrates, Khabur and Balikh, and the bordering regions of Iraq and Turkey, developing 5500 B.C., after a brief phase of black lusterware of a different tradition than that of the littoral, the magnificent polychrome painted ceramics of the Halafian culture. The Halafian repeats, in its figurines and its pottery decorations, the symbolic themes (representing goddesses and bulls) that appeared in Mureybet two millennia earlier. It is the beginning of cultural unity over a great geographic expanse, characterized by intense commercial exchanges that now included pottery itself in addition to Anatolian obsidian, traded since the Natufian. The pottery from Halaf reached the littoral shortly before 5000 B.C.: it has been found at Ras Shamra IV and in the plain of Amuq (phases C–D).

At the end of the 5th millennium, Syria finally enters into the movement of a new civilization, the Ubaid, an even vaster area which extends from the Arabic Gulf and Lower Mesopotamia, where it seems to originate, to Syrian Jezireh and even to the littoral Mediterranean. Here one encounters traces, more or less hybrid with local influences, at Ras Shamra III and at phase E of Amuq.

The Ubaid culture represents a decisive advance in the urbanization of the societies of the Near East, because one can perceive there for the first time an architectural plan which clearly differentiates between ordinary habitations and more monumental buildings of a public nature. This is the direct preparation of urbanization for the Uruk period where writing and "History" will take their first steps.

TRANS. STEPHEN ROSOFF

BRONZE AGE AND IRON AGE SYRIA

Many features which characterize the civilizations of the Early Bronze Age did not appear suddenly but as the result of a long history of development and experimentation going back in many instances to 10th millennium B.C. The cultures of many areas of the Near East attained a remarkable stage of crystalization by the middle of the 4th millennium B.C. Well-organized, fortified cities existed in Syria with elaborate temple and religious structures and administrative support organizations that exploited and facilitated exchange, supervised developed agriculture and animal husbandry systems, controlled technological and other modes of production, and in general made their influence felt over great distances.

A. Early Bronze Age
B. Middle Bronze Age
C. Late Bronze Age
D. Iron Age I
E. Iron Age II

———

A. Early Bronze Age (ca. 3000–2000 B.C.)

It seems, at first glance, that there was a retrenchment at the beginning of the 3d millennium, a consolidation of local cultural features at the expense of wider concerns, but this impression may change as additional evidence become available. Continuity from the end of the Protoliterate is evident in the ceramic inventory with the continuation of characteristic vessels like crude beveled-rim bowls, and specific vessel types with reserve slip and various incised decoration, but there is significant change. Similarly, the limited evidence for metalworking indicates that this technology has its roots in the 4th millennium B.C. Bronze figures cast in a lost-wax process were found at Judeideh in a Phase G context. The modeling of the figures is quite sophisticated and clearly represents a developed art style of which little else is known.

The major centers of Mari, Ebla, Hama, Ugarit, Khuerah, Braq, and Leilan were occupied at this time, but it is not clear whether they were small settlements which developed into great cultural centers or whether they already were major population and administrative centers. Only a handful of sites help us to define the very beginning of the Bronze Age. Judeideh and Chatal Hüyük in the Amuq provide a well-known sequence; Hadidi and nearby sites at the big bend of the Euphrates River provide a comparable sequence; Braq and Leilan demonstrate the sequence in the E. At Mari, the EB I material is present at the edge of the site and at Mardikh it is found beneath the later EB palace G of Level IIB1, in the context of another major building in Level IIA.

Several distinctive pottery forms can be isolated as characteristic of the EB II, particularly a bowl or cup form with a "cyma-recta" profile. Hadidi in the Euphrates Valley and Qalat el Mundiq in the Orontes Valley, with the Amuq sites and a few others, delineate this second phase of the EB. Many simple but characteristic cup, bowl, and jar forms of normal buff wares continue with slight development from EB I, documenting clear continuity.

Geographical variations are already very specific in these earliest EB phases. Painted decoration or colored slips on pottery are common in the coastal areas in the Amuq and in the Khabur area, but are

uncommon in the Euphrates River Valley. The so-called "Ninivite V" painted and incised wares seem consistently to follow levels with beveled-rim bowls, but their exact phasing and geographical range must be more precisely determined.

New traditions in the cultural assemblages of Syria began to develop in the second quarter of the 3d millennium. The tremendous archives from Tell Mardikh (Ebla) provide a new perspective on the cultures of ancient Syria; together with the finds from Mari which have been known for several decades longer, they block out the development of Syrian languages, architecture, and the arts during the remainder of the 3d millennium.

Written evidence in monumental architectural contexts, gives us an insight into the cultures of these cities from a completely different perspective than we are able to see from the cultural sequences documented for earlier periods. These written materials provide an insight into the specifics of international trade, the commodities which were exchanged, the routes along which they moved, and the major urban centers that controlled traffic. They allow us to understand the regional organization of the state, particularly how it monitored agricultural and industrial production. They give us an impression of the local written tradition and the maintenance of foreign language traditions. They provide documentation of the local religious traditions and practices, and how these fit into the fabric of the world around them. They demonstrate the complex fabric of cities and cultures working in cooperation or in open warfare; alliances, treaty relationships, spheres of influence, cultural regions, ethnic relationships, the relationship of ruling families and the causes for which armies moved to aid an ally or to stop the advance of an enemy state or coalition. Mari and Ebla were prime players with Assur, Urkish, and a number of other major centers of the time. See EBLA TEXTS and MARI (TEXTS).

With this written documentation as a background, many of the artifactual remains can be more precisely interpreted. The major palace exposure of the final phase of Ebla reveals two sides of a large audience hall with large columns supporting a portico. A large throne dais was built under the N portico. An elaborate square stair tower and a monumental stairway just to its S, allow movement from the court to the portion of the palace at a higher level on the citadel. Archive, office, work, and storage rooms adjoin the court in the areas which have been excavated. Palace artisans created a variety of materials for trade and for the embellishment of the palace. Some of the commodities known from the texts, like the textiles, have not been preserved, while other commodities have been preserved in a very limited way. Portions of elaborately decorated furniture, with carved wooden elements and with inlays of ivory and stone, and small pieces of composite sculpture in stone and precious metals are preserved. An art style similar to that which is characteristic of the end of the Early Dynastic and the beginning of the Akkadian periods in Mesopotamia is represented on cylinder seal impressions on clay. Imported vessels in Palace G are best represented by stone vessels of Egyptian manufacture, a few of which carried the royal names of Chephren, Pepi I and Pepi II, rulers of the 4th and 6th Egyptian dynasties.

A wealth of artistic representation is found at Mari as well, though the number of tablets of the period contemporary with the Ebla archives is still small and most of the inscriptions of the period were found on votive statues. The artistic style is documented in cylinder seal impressions, inlays for plaques and other small items, but particularly by free-standing votive figures.

Major archives also must have existed at the sites of ancient cities that coexisted with Ebla and Mari in the complex cultural fabric of the time, cities mentioned in the texts like Armanum, Tuttul, Harran, Emar, Alalakh, Ugarit, Byblos, Homs, and Damascus. Unfortunately evidence of artistic production from other sites in Syria is extremely limited. The few votive figures and stele that are preserved from Habuba, Selenkahiye, Khuera, and Mozan are far less polished than the products of royal artisans at Mari and Ebla. Khuera and Selenkahiye in particular provide a corpus of cylinder seal impressions which expand our knowledge of the repertoires of Early Dynastic and Akkadian period seals. Extremely common at many sites are the "average person's" artwork represented by thousands of handmade figurine fragments depicting human and animal forms.

The ceramic sequence is very well documented, and distinctive wares can be isolated which cluster materials into regional assemblages. Extremely thin, "metallic ware" vessels, some rivaling the much

later, Late Assyrian palace wares in extreme thinness, are common along the Euphrates and into the Jezireh. A gray ware, designated stone ware, is at home in the Khabur area, particularly at Braq. Most of the pottery traditions are of buff wares with a variety of forms, clay compositions, and thicknesses that can be used to further define the various districts. One vessel type which has received considerable attention as a link to Palestinian assemblages is a sequence of cup forms. A long sequence of such forms can now be demonstrated for a period of about 600–700 years. Early in the sequence a distinctive variety is the metallic ware cup with thin corrugated sides and folded-over lip. The base treatment changed, proportions changed, and the lip and sides were simplified in later varieties. The sequence ends in the 20th century B.C. The most specific variant of this sequence is a tall chalice with distinctive painted and incised decoration found at Mardikh in IIB2, Touqan, Hama in J5–1, and the Amuq in Phase J.

Sketchy or limited evidence does not allow us to show the full geographical extent of the regional assemblages of the end of the 3d millennium. The culture of the Assyrian heartland to the NE, centered in the Mosul region, was a traditional cultural focus which rivaled Mesopotamia and heavily influenced both Mari and the river valleys of the Khabur, Balikh, and their tributaries. Excavations at Leilan, Braq, Chagar Bazar, Mozan, Melebiya, Khuera, Bderi, Tuneinir, and a number of other sites presently under excavation in the Khabur Dam salvage area; at Hammam et Turkman and Bi‘a on the Balikh, are beginning to define the extent of the cultural spheres which extended out from Mari, Assyria, and the Syrian Jezireh. The Tabqa Dam salvage projects at Hadidi, Mumbaqat, Qanas, Sweihat, and Selenkahiye define a middle Euphrates assemblage between the Jezireh and the Aleppo-Mardikh area while the Amuq sites (Ugarit and Tabbat el Hammam) represent distinctive areas of another cultural tradition which stretched along the Mediterranean coast from Turkey to Lebanon. Less well known or documented are the Homs, Damascus, and Lebanese Beqa regions, which must have been centers of equally distinctive regional cultures. The early excavations at Qatna and other sites provide only limited hints of the characteristics of the EB culture at the E edge of the S cultural areas where they come up against the Syrian desert at the contact points with a major desert roads.

Our knowledge of the cultural assemblages of Bronze Age Syria has improved tremendously in recent decades. The later parts of the EB III–IV horizon correspond with the Akkadian and Neo-Sumerian periods in Mesopotamia, but the subdivisions are not yet clear and the beginning of this horizon predates the Akkadian period. The amount of information which is lacking, however, is as impressive as the information which is available. It is clear that the material culture of certain areas of Syria, like the coast, have close parallels in some specifics with Palestinian sites, but on the whole what is now most impressive is the individualistic nature of the assemblages of specific geographical areas. Syria must be seen as culturally distinct from Palestine, Anatolia, Mesopotamia, and Assyria. The ethnic identity of the cultural groups associated with the material assemblages in the different areas of Syria is still a matter of discussion, and is based on limited information. Semitic, Hurrian, Anatolian, and other personal names are present at Mari and Ebla, but their concentration at specific sites and the interpretation of their distribution is problematic. We have used approximate, rounded-off period dates throughout this article, because with our present state of knowledge, we must rely on relative rather than absolute dates for Syrian chronology.

B. Middle Bronze Age (ca. 2000–1550 B.C.)

The cultural surroundings of ancient Syria changed drastically between the 3d and 2d millennia B.C. with the shift of power and influence in Mesopotamia from the 3d dynasty of Ur to the dynasties of Isin and Larsa, and in Egypt with the renewal of centralized authority under 12th Dyn. rulers, restoring unity after a “dark age.” Significant changes occur in Syria as well, and new cultural traditions are well developed in all areas by the 18th century, MB II. Similar to Egypt and Mesopotamia, and unlike Palestine, urban traditions continue through a difficult transitional period. Scattered sites like Mari, Hadidi, Hama, Judeideh, and Chatal Hüyük, document a transition in ceramics.

Distinctive new decoration styles are established as characteristic features of the ceramic assemblages in the Amuq–Cilician and Khabur areas. In the intervening area, particularly along the Euphrates, painted decoration is, again, extremely rare and the ceramic sequence has to be defined by the development of

specific rim forms and comb-incised decoration. Decorated basins from temple areas at Mardikh reflect artistic conventions which go back to the glyptic of the Early Dynastic period in Mesopotamia. The style of carving is well known from contemporary cylinder seals, particularly seals found in Anatolia at the trading center of Kültepe (Kanish) in Level II.

Occupation of the vast area of the Jezireh is most dramatically affected, probably because of ecological changes, and does not rebound to any degree in the new millennium. This was the case also with cities like Selenkahiye and Sweihat in the Euphrates Valley. At Hadidi, there is a dramatic reduction in the size of the site. Other geographical areas, like the Orontes Valley also show a decrease in urban population densities. The size of Mari at the beginning of the 2d millennium is not clear, but a major palace area continued in use in the same location where one had stood for centuries. A large, newly fortified urban settlement was constructed at Mardikh at this time.

Scattered written evidence exists, but the prime source for the period is from the palace archives at Mari. This rich source of information reveals a complex interaction of city-states from the Khabur area, Assyria, and Iran to the NE, Mesopotamia to the S, and the Aleppo area to the W, as well as a relationship with significant component of nonurban populations. The political organization of a typical state is revealed at Mari as well as the dynamics of interstate rivalries and cooperation. Zimri-lim, son of the Mari ruler, Yahdun-lim (1825–1810 B.C.), was forced to leave his home city and reside with a friendly dynasty in Aleppo. After a time, Zimri-lim (1782–1759 B.C.) was able to regain his family patrimony from the ruler of Assyria, Šamši-Adad (1815–1782 B.C.), who had installed his son Yasmah-Adad at Mari. Mari correspondence demonstrates centralization of power for a time in the Assyrian heartland and the rebuilding of the capital city at Shubat-Enlil, now identified with Leilan. The temple and other monumental architecture excavated there, as well as the written records of the period, will shed further light on this period of Assyrian expansion.

Hammurabi (1792–1750 B.C.) of Babylon emerged victorious in the interstate conflicts of the time in carving out a significant area of control for his Babylonian dynasty. Mari is one of the cities which succumbed to Hammurabi's advancing power and did not recover. Political power in this area of the Euphrates shifted to the city of Khana. Excavations at Ashara have brought to light many centuries of this city's history including archives of limited size and information, a private archive of Puzurum, and an archive from the temple of Ninkarak. The other significant Syrian archive of this period is from the Level VII palace at Alalakh in the Amuq.

Good archaeological sequences have been exposed at Hadidi, Halawa, Habuba and Qanas, in the Tabqa Dam salvage area on the Euphrates, and at Hama and Mardikh. Mardikh has yielded some of the most spectacular remains for this period also. A portion of a palace, several administrative buildings, and the gateway show a well-developed style of substantial architecture. Royal tombs have been found beneath the floors of one building, but only one statue provides a written inscription. The use of orthostats, in many cases alternating basalt and limestone as in the palace and one phase of the gateway, are a distinctive feature here and in the Alalakh VII palace.

A distinctive temple tradition, which continues into the LB, is now well documented on many sites. The temples are basically organized on a central axis. Entry is usually made through a pillared portico or entrance room and the structures are usually deeper than they are wide. Specific features like exceptionally thick walls, the presence of an entrance room or a niche centered on the back wall, show some development through time. Some of these peculiarities may be associated with the worship of specific deities, but only in a few cases is the god worshipped in a temple conclusively established. At Mari, the Dagan temple near the palace is of the axial type just mentioned, while the contemporary phases of the Ishtar temple maintain a different, indirect-access temple type.

The corpus of sculpture of this period comes primarily from Ebla and Mari. The Ebla basins have been mentioned but several additional fragments, and other fragments of votive statues were also found. Most of the Mari sculpture is from the palace area, primarily free-standing statues of officials and the famous goddess holding a vase overflowing with water.

The Mari palace was considered a wonder in its time and an attraction for visiting dignitaries. Its walls were extensively decorated with geometric and figural murals. Most famous of these scenes is the "investiture scene" in the courtyard near the throne room. The subject matter overlaps with scenes from other media, particularly glyptic. The style of well-articulated, naturalistic figures is well known from seals and plaques, but an additional dimension is added by the color renderings of costumes, furniture, and other details. Mythological scenes are also represented, but again mostly in a format known in glyptic art.

The glyptic art of MB II Syria reached a high point and is well represented at Mari, Alalakh, Ebla and through numerous seals which have appeared on the antiquities market. Several distinctive area styles can be distinguished on the basis of Mesopotamian, Egyptian, or Anatolian motifs which they incorporate. The excellent workmanship, design, and naturalistic renderings created striking, polished miniature works of art which are a sharp contrast to the seals produced at the beginning of the MB. A beautiful sculpted head of the statue of a ruler at Alalakh is an excellent representation of this art style in another medium.

C. Late Bronze Age (ca. 1550–1200 B.C.)

The MB Age ended with a Hittite incursion into Syria under Mursilis I, a campaign which continued S along the Euphrates and resulted in the destruction of Babylon and the end of the Old Babylonian period around 1600 B.C. Subsequent Hittite rulers were not able to follow up on these victories, but the international competition for influence and control in Syria reached a new level in the LB. Egypt was a constant threat at the end of its 17th and the beginning of its 18th dynasties, through the time of Thutmose III (1504–1450 B.C.). Egyptian temple reliefs document campaigns far into N Syria and list cities on the Euphrates on their line of march. Hadidi (Azu) and Mumbaqat (Ura) have been identified among these cities. Hadidi in particular demonstrated the presence of outside influence in the assemblage of materials from the beginning of the LB. There is a sudden break with the basic plain-ware traditions of the Euphrates Valley that consistently reflects a Mesopotamian orientation. A phase with chocolate-on-white decorated pottery and a specific variety of grey wares that represents traditions originating in the S and on the sea coast, marks the transition to the LB. This unexpected change may represent the effect on the local culture of Egyptian influence at the beginning of the period which caused the spread of cultural features which previously had been confined to the areas most strongly influenced by Egypt, namely, Palestine, S Syria and the sea coast.

Before long the Egyptian influence was confined to S Syria, but a growing Hurrian domination extended over N Syria. Alalakh in Level IV represented a Hurrian dependency near the coast with a large archive of tablets preserved in the destruction level of the palace. Hurrian cultural influence is well documented in the tablets from Nuzi (in the Assyrian heartland) and later from Ugarit. Occupation of the period has been documented at many sites including Hadidi and Mumbaqat where small personal archives have been found in buildings with large well preserved inventories. The art style of the beginning of the period is represented by a few pieces of sculpture like the statue of Idrimi and crude basalt figures at Hadidi, Alalakh, Hama, and elsewhere, but not enough is available to define more than a rough component of the contemporary sculptural style. The polished glyptic style of the previous century was modified and a class of common seals with abstracted; simplified renderings became very common. Most of these common style seals were produced in faience or frit and are found virtually throughout the Near East from Egypt and Palestine to Iran and Turkey. One of the most characteristic features of the ceramic repertoire of the Mitannian period is the "Nuzi" ware and its western "Atchana" variation in the materials from Alalakh IV–II. This luxury ware treatment of white decoration on a dark slip, highlights elaborate floral and geometric patterns. Such wares are known throughout N Syria and Assyria but usually in small quantities.

The private buildings at Hadidi and Mumbaqat are square structures organized around rectangular courts. A similar architectural organization forms the nucleus of the plan found in greater elaboration in the Alalakh level-IV palace. The archives of Alalakh, Hadidi, Mumbaqat, and Bi›a provide stratified seal impressions of the period as well as a wealth of personal names peculiar to each region and an illustration of the local variants of Akkadian. A Mitannian palace area has been excavated at Braq and a portion of a

palace and a temple at Bi›a. The archives found at Nuzi provide many insights into the distinctive features of the cultural area under the control of Mitannian rulers and yield a good representation of glyptic. The wealth of minor art objects and architecture from Nuzi provides excellent comparative material for Syrian sites.

The final days of the Bronze Age city at Ugarit are dramatically revealed in the remains of its palace as well as records of several centuries of international political activities and palace administration. An outlying seaside palace at Ras Ibn Hani near Ugarit provides contemporary information. Religious texts from a temple area at Ugarit have added a new depth to the study of biblical texts by revealing temple rituals, the complicated pantheon of deities worshipped at Ugarit, and a rich collection of important mythical texts. In documenting the language and grammar, these findings provide insight into an early stage of development in many genres which are well known in biblical traditions. Another major discovery at Ugarit is the use of a new cuneiform script for most religious texts, but also for some regional administrative documents, a script which marks a significant stage in the development of alphabetic writing. The major international language, however, remained Akkadian. See UGARIT (TEXTS AND LITERATURE).

The collections of tablets at Ugarit are only a portion of the rich finds from this site and its nearby dependencies at Ras Ibn Hani and Minet el Beidha. The sea-side location of this major trading center was responsible for an international imprint on the city's culture and arts. Imported pottery from Cyprus and the Aegean area is common at this transit point and on many coastal sites, but only to varying degrees inland. It is well represented in Palestinian excavations, the Transjordan, S Syria, and the Beqa. Egyptian influence made a strong impression on the art style of Ugarit with clear motifs, like Hathor curls, *ankh* symbols, adapted Egyptian headdresses, etc., evident on palatial ivories and cylinder seal impressions. Hittite motifs were common during the Hittite Empire period, but Mesopotamian styles and motifs maintained primary importance. Despite these influences, the hand of the local artist is clear in the selection and shaping of foreign ideas and themes in their products. Evidence for sculpture is limited but the small arts, cf. copper, bronze, and clay figurines, mold-impressed plaques, carved ivories, faience vessels, beads, and amulets are numerous.

Other areas of Syria demonstrated their traditional orientations. Middle Assyrian glyptic is well represented at Sheikh Hamid, Fakhariya, and other sites. Hittite seals with their typical motifs and hieroglyphic inscription are found at many sites in N Syria. Architecture shows marked Hittite influence in temples at Alalakh, fortification, gate and tomb construction at Ugarit, and domestic buildings at Meskene. It is not clear how far the metropolitan pressure at Ugarit, which resulted in the use of multistoried structures, spread beyond cities of the sea coast. Certainly the art and architectural styles were lively, inventive, and flourishing, but the flowering was short-lived and the old traditions continued on as underlying constants. The dual temples at Emar, the continuation of the use of the temples at Mumbaqat and the variation of temple types in the long sequence of temples at Alalakh (with the dominance in the traditional local axial types) are excellent examples of such continuity.

Several other large archives also were terminated at the beginning of the 12th century B.C. in roughly contemporary destructions. They help to fill in the historical, cultural, and religious picture of the area of N Syria at the end of the period of Hittite political domination and confrontation with Assyria in the E. Previously this period was illuminated primarily by the international correspondence from the royal archives from el Amarna in Egypt. Extensive temple archives and small administrative archives were found at the Hittite regional administrative center of Emar (Meskene Qadime) on the Euphrates. A smaller archive was found at Tell Frey and a single tablet at El Qitar, both nearby sites. The 13th–12th century archive at the Assyrian city at Sheikh Hamid, on the lower Khabur, shows the strength and influence of the Assyrian rulers of that period, who on several occasions campaigned across the Euphrates and reached the Mediterranean coast. Their activities must have played an important role in the demise of the Hittite Empire, known otherwise from an opposite point of view in the texts found at Bohazkoi, Ugarit, and Egypt.

D. Iron Age I (ca. 1200–1000 B.C.)

Evidence for the Iron Age in Syria is much more limited than that for the Bronze Age. Spectacular monuments, sculpture, and a broad range of artifacts have been excavated but written material is limited. Most of the inscriptions that have been found are royal inscriptions or proclamations. It is still difficult to place these materials and the artifactual information into the context of the written evidence from surrounding areas, from Egypt, Greece, Assyria, Babylonia, Palestine, and the biblical record.

The beginning of the Iron Age was marked by a dramatic change from what had gone before. New realities replaced the Hittite political structure. Westward pressure from the armies of the Middle Assyrian rulers abated after a time, the sea coast was under severe pressure from peoples of Aegean origin, and Aramean groups exerted pressure from the desert areas. Despite the upheaval and the integration of new population elements, many traditions were maintained through the transition. Some sites continued to be occupied from the Bronze Age through into the Iron Age, but the basic fabric of the area's cultures had been drastically altered. The ever sensitive indicator of ceramic production showed a major change. Pottery with monochrome decoration reflecting Aegean models of the 12th century B.C. and earlier, is distinctive at sites near the coast. This pottery has been excavated at Chatal Hüyük and Judeideh in the Amuq; on the coast at Ras el Basit, Ras Ibn Hani, Byblos, and farther S; but further inland, where painted pottery is traditionally rare, excavated sites of the period are also rare.

The Tabqa Dam salvage area on the Euphrates, saw a drastic reduction in the number of inhabited sites so that the Iron Age is barely represented. Farther upstream at the major sites of Til Barsib and Carchemish, major Iron Age centers were established. As a major Bronze Age Hittite center which maintained its importance, Carchemish withstood external forces for a considerable time and preserved earlier traditions more consistently than many other cities. The site of ʿAin Dara in the Afrin Valley W of Aleppo, was also occupied at the end of the Bronze Age and through much of the Iron Age.

E. Iron Age II (ca. 1000–550 B.C.)

Many important sites fill in the Iron Age picture in Syria, like: Taʿyinat, Chatal Hüyük, Judeideh, Rifiaʿat, Deneit, Nirab, Qarqur, Afis, Abu Danne, Safire, Hama, Arslan Tash, Halaf, Fakhariyah, Sheikh Hamid, Agaga, Ashara, Mishrife, Nebi Mend, Ras el-Basit, El Mina, Soukas, Amrit, Tabbat el Hammam, es Salihiyeh, and Ashtara. Some sites represent a long sequence and others provide monumental architectural remains, including wall paintings and elaborate sculptural architectural embellishment, but the length of use and contemporaneity of individual building phases between different structures is difficult to reconstruct with precision. Even where inscriptions mentioning Assyrian rulers are present, it is difficult to be certain unless there is a good clustering of material in its original context. Monumental sculpture was reused and early excavation techniques do not allow us in many cases to tie the artifacts very closely to the architecture. By the end of the 11th century, many independent city-states developed across Syria, similar to the pattern of city-states that existed in the Bronze Age. As time went on, the earlier pattern of struggle between rival coalitions, the creation of larger states, and eventually the incorporation of states into large, foreign-dominated superstates continued.

The city-states of NW Syria were part of a broader culture area which included Cilicia, stretched to Malatya in SE Turkey, and S to Damascus. The term "Neo-Hittite" is often used to describe these states for a number of reasons: Assyrian records refer to much of the Syrian area as Hittina; the characteristic hieroglyphic style of writing of the Hittite Empire period, derived from Luwian written traditions, continues in use; and many other features of Hittite culture, like the sculptural tradition, continue. ʿAin Dara and Carchemish should, with continued excavation, demonstrate exactly how the cultural features, the ruling elite, the organizational structures, etc., depended on earlier models and traditions. An extraordinary temple complex has been excavated on the acropolis of ʿAin Dara where rows of monstrous lions and sphinxes guarded both the entrances to the temple and the holy of holies. Meter-long footprints of the god were carved on the floor between the portico columns and on the door sills. Processions of animals and some dignitaries formed a sculptural band around the exterior walls of the temple and the platform upon which it stood. Hittite conventions and themes are strongly evident in dress, proportions, and surface finish, particularly in the earliest sculptures. Local influence is, however, also clear in the animal bodies, the treatment of the heads, and the stances of the figures. At Halaf, the striking, primitive

sculpture of the Kapara palace complex represents a similar phenomenon with unusual combinations of features and awkward proportions in the sculptures.

As the cities of the area revived economically and the local rulers attempted to display their wealth in new artistic and architectural construction, they apparently used local talent either to pick up and continue earlier traditions, reflecting the traditions of the contemporary Assyrian state, or to develop distinctive, independent styles. Some sculptures at Carchemish also provide a continuity with past Hittite traditions. Several long rows of sculptured orthostats have been arranged chronologically and dated through almost four centuries of the Iron Age. The reliefs decorating the royal citadel and "hilani" complex at Halaf can be compared with reliefs early in the Carchemish sequence, representing early works of sculpture of a developing style which demonstrated considerable imagination and innovation.

Isolated sculptures of the 10th and early 9th centuries B.C. have been found at numerous other sites beside Halaf. The awkwardness of the earlier sculpture remains, like the statue of Adad-it›i/Hadad-yis‹i found at Fakhariyah (probably dating to the middle of the 9th century B.C.), show that the Assyrian influence is considerable. The bilingual inscription in Aramaic and Assyrian seems to be a necessity for communication with different constituencies. The area of Fakhariyah (Sikan)/Halaf (Gozan) on current evidence does not continue the use of the Luwian hieroglyphic script as is the case at Carchemish, Ta‹yinat, Malatya, and Hama. The art style demonstrated on the monuments of Kilamuwa of Samal (Zinjirli) are characteristic of this time, but his inscription is in Phoenician script.

The presence of Assyrian motifs and stylistic features are even stronger in the materials which fall between the second half of the 9th century and the middle of the 8th century B.C. With the victory of the Aramean, Israelite, Ammonite, etc., coalition by Shalmaneser III's army at Qarqar in 853 B.C., the political situation in N Syria changed. "Neo-Hittite" building complexes or citadels have been excavated late in the period at Hama, Ta‹yinat, Zinjirli, and Sakjegözü with a series of administrative buildings and temples in distinctive "hilani" style, characterized by pillared entrance porticos and main rooms at right angles to the axis of the porticos. The associated inscriptions represent statements of local rulers in monumental form, but in a context of strong Assyrian influence. Apparently the rulers were allowed to maintain their local traditions and independent status, but under ever increasing Assyrian control. At Agag on the Khabur, the accidental discovery of a gateway with flanking lions in a style characteristic of late-9th–early-8th century Assyria clearly demonstrate Assyrian domination in the artistic tradition.

The changing political climate is reflected in many other categories or artifactual evidence beside artistic production. The ceramic hallmark of the period is the use of a red slip to decorate a set range of vessel forms, particularly bowls, platters, and jugs. At the same time, the characteristic monochrome painted pottery of the earliest centuries of the Iron Age ceases. These two changes in particular are quite sudden and occur, as in Palestine, roughly at the beginning of the 10th century B.C. At that time, the red-burnished tradition includes primarily rougher, utilitarian appearing vessels with the most common color range of the slip being in dark shades and often to brown. By the end of the period, the most common range of colors is much lighter and toward a pink shade, but experimentation with more controlled firing procedures produced cream, white, or black variations. Burnishing procedures on the earlier forms were primarily done by hand and often in a variety of patterns. This gives way to the burnishing of vessels on a turning surface or wheel. Solid, overall burnishing is displaced by spaced burnishing in the 7th and 6th centuries B.C.

International contacts expanded with each successive century in the Iron Age and beyond. An increasing level of sharing of information and exchange of materials is evident, though it is difficult to interpret the extent of the rivalry between Phoenicians, Greeks, and Cypriots for control of coastal trade. Imports from Cyprus and the Aegean become more frequent through the 8th and 7th centuries. So far, the quantity of Greek material has not penetrated very far inland from the coastal areas at places like Al Mina. This trade depot and port city has provided rich evidence for Cypriot imports with White Painted (III), Bichrome (III–IV) wares, Black-on-Red wares, and ring-necked juglets as well as Greek imports, specifically Protogeometric vessels and Cycladic cups, of the 9th and 8th century B.C., and Protocorinthian,

Corinthian, and Rhodian vessels of the 7th century B.C., and Greek imports from the 8th through the 5th centuries.

A break with the pattern of independent city-states seems to come with the reorganization of the areas under Assyrian domination into a provincial structure under Tiglath-pileser III (744–727 B.C.), following a short interlude when one of Assyria's N rivals, Urartu, controlled or influenced a large portion of N Syria. The full effects of the Assyrian reorganization is apparent at the end of the 8th and into 7th century B.C. with the palace complexes which are constructed at Ta‹yinat, Barsib (Bit Adini), and Arslan Tash (Hadatu). These large, extended palaces, closer to the Mesopotamian style, replace the "Neo-Hittite" citadel complexes with their grouping of smaller independent structures. Similar to the "Assyrianizing" of architectural building and planning, the same is observable in the area of art styles. The local traditions mentioned earlier give way to increasing influence from Assyrian styles and eventually to art works produced to conform very closely to the contemporary Assyrian styles. The stelae of Panammuwa and Barrekub at Samal represent local styles with strong Assyrian influence in the time of Tiglath-pileser III and just after. The Assyrian royal and governors palaces provide rich sources for the cultural materials from the dependent areas which had been gathered as booty and tribute. Palace reliefs document the contact and confrontation with these areas as well.

The decoration of the palace at Barsib on the Euphrates is an excellent example of Assyrian art, unique in being preserved in full color, as if it were constructed in the Assyrian heartland. Wall paintings decorated in the styles of the reign of Tiglath-pileser III, or just after him, are preserved. The palace continued to be used for a long time, possibly to the end of the Assyrian empire, and saw major refurbishing and the renewal of wall paintings under Assurbanipal (668–627 B.C.). An Assyrian palace has now also been excavated on Syria's E edge at Sheikh Hamid.

A Greek settlement at Soukas in the 6th century B.C. is indicated by the heavy concentration of Greek pottery and a temple installation. Similar pottery is present at the coastal city at Ras el Basit and at Ta‹yinat slightly inland, as it was farther S in Lebanon at Arqa, Sarafand, Tyre, and Kamid el Loz. As time went on, the cultural assemblages of these areas displayed their perennial leaning toward Egyptian cultural influence. This increasing influence continued at the end of the Iron Age and beyond when, successively, the Assyrian, Neo-Babylonian, and Persian empires controlled extensive areas of the Near East and administered these areas as provincial dependencies. This had a unifying effect on the cultural expression illustrated over a broad area. The evidence for the end of the Iron Age is very limited, but sites like Deneit and Amrit illustrate the distinctive features of the culture of the end of the Iron Age and the Persian period.

RUDOLPH H. DORNEMANN

SYRIAC LANGUAGE. See LANGUAGE (INTRODUCTORY SURVEY); LANGUAGES (ARAMAIC).

SYRIAC MENANDER. A collection of popular wisdom sayings ascribed to Menander the Sage and included among the OT Pseudepigrapha. It is found in a Syriac manuscript now kept in the British Museum (BM Or. Add. 14.658, fols.163v–67v) probably dating from the 7th century C.E. The text was edited by J. P. N. Land in 1862 and corrected by the editor (1868), by W. Wright (1863), Schulthess (1912), and later by Audet (1952). A short extract of the same text is found in BM Or. Add. 14.614 of the 8th or 9th century (Sachau 1870). The nature of the florilegium may be adequately defined as wisdom literature in the form of pragmatic rules for human behavior: how to live with parents, children, women, brothers, friends, older people, slaves and enemies; how to behave while drinking or eating; how to use riches or to face the vicissitudes of fate. It consists of precepts, prohibitions, paradigms, and short characterizations of human attitudes.

It is very difficult to determine the number of maxims contained in the anthology. The following sample shows how counts have varied: 96 (Audet 1952), 101 (Schulthess 1912), 103 (Riessler 1928) or 153 (Baumstark 1894). The English translation abstains from numbering the dicta, but presents 474 lines consisting of about 110 different sayings. There is no uniformity in the format of the maxims; some are monostichs, some distichs, and others are longer units of a sapiential nature. Although there are a few thematic groups of sayings, such as on adultery and fornication (II.45–51), on eating and drinking (II.52–66), on servants (II.154–66), it is impossible to find an organizing principle in the sequence of the various counsels. This lack of system may indicate that the redactor drew from different sources in compiling the florilegium.

In the manuscript, the anthology is placed between extracts from Greek authors and philosophers; from this placement it is clear that Menander was held to be the famous representative of the New Comedy at Athens (ca. 300 B.C.). Baumstark (1894) suggested that these sayings might in fact have been borrowed from Menander's plays, but there is no evidence for that. It is more likely that the collector attached the playwright's name to the collection because there were other anthologies of sayings already circulating under the name of Menander.

It is possible that one of the sources was in fact an anthology ascribed to Menander. There are several sayings in our collection reminiscent of Menandric monostichs; one is "Blessed is the man who has mastered his stomach and lust" (1.65 [*OTP* 2:588]), which resembles the maxim "It is a good thing to master one's stomach and lust" independently attributed to Menander (Jaekel 1964:57). However, there are also many affinities to Jewish wisdom literature in Proverbs, Sirach, Ahiqar, and Pseudo-Phocylides, which may suggest that the redactor of the florilegium was acquainted with this type of sapiential literature (*OTP* 2:586–87). Was the author a Jew (Frankenberg 1895), a member of the so-called God-fearing circles in Egypt (Audet 1952), or a cultured pagan writer who, in drawing up this collection of wisdom sayings, incorporated in a Greek anthology material from oriental wisdom traditions, including Jewish sapiential sayings? The author, if Jewish, may have concealed that fact (note *Syr. Men.* II.263–64:"but the gods are despised by their priests," which suggests polytheism) in order to convey Jewish ethical instruction to pagan readers under the guise of a pagan writer. In either case, the author was religious, and could summarize all human conduct by referring to the fear of God: "The main source of all good things is the fear of God, it delivers one from all evil things" (*Syr. Men.* II.394–95).

As to its date (3d century A.D.?) and provenance (Egypt?) nothing can be said with absolute certainty.

SYRO-EPHRAIMITE WAR. A modern term (but see Isa 7:2) designating a war that pitted the kingdom of Judah against a coalition comprised of Damascus (Syria) and Israel (Ephraim) (2 Kgs 15:37; 16:5–9; Isa 7:1–9; 2 Chr 27:1–9; 28:1–27). The apparent purpose of the war was to dispose of young Ahaz, king of Judah, and to pressure Judah into joining Rezin of Damascus and Pekah of Israel in opposition to the expanding Assyrian empire. Assyria, however, came to Ahaz' assistance and relieved the pressure by attacking Syria (Damascus was captured ca. 732 B.C.). A decade later the Assyrian army attacked Israel, destroying Samaria in 722/721 B.C. Judah then became a vassal state of the Assyrian empire.

A. Sources

1. Biblical. The rather numerous references to the war in biblical sources raise problems of interpretation related to the editorial arrangement of texts referring to the war. Therefore, we can sketch the main events of the war, but we cannot always be certain about the overall chronological sequence. From 2 Kgs 15:37 we know that the war began during the reign of Jotham, son of Azariah (Uzziah). Rezin of Damascus and Pekah of Israel joined in attacking Jerusalem (16:5), which lost control over Elath to the south (16:6). Jotham's son and successor, Ahaz, then sent messengers and tribute to the Assyrian king Tiglath-pileser III (16:7–8), who captured Damascus and killed Rezin (16:9), and seized some of Israel's northernmost towns (Ijon, Abel-Beth-Maacah, Janoah, Kedesh) and provinces (Gilead, Naphtali, Galilee) (15:29). Pekah was assassinated by Hoshea, who then became king (15:30). Ahaz met with Tiglath-pileser III in Damascus (16:10). The book of Chronicles (2 Chr 27:1–9; 28:1–27) draws in part from the account in the book of Kings, but arranges the account differently and utilizes other sources, some historical (accounts of wars against the Ammonites and Philistines) and some perhaps not (e.g., the account of Obed the prophet).

Passages in the various prophetic books provide a glimpse into the international tensions of the time. For example, some of the oracles of Amos refer to such affairs (Amos 1–2; 3:9; 5:26–27; 6:1–7, 13), while Hosea knows about plots against kings of Israel (7:3–6), a war between Judah and Ephraim-Benjamin (5:8–9), and pressures from Assyria or Egypt (7:11; 8:9; 9:3). Some of the oracles of Micah antedate the downfall of Samaria (1:6) and the "evil down to the gates of Jerusalem" (1:12, 13). Some prose portions of Isaiah, in Deuteronomic fashion (e.g., 7:1–3 compared with 2 Kgs 16:5 and 8:17b), refer to the war. Many of his oracles seem to have their historical context in the war (7:4–9; 8:3; 9:7–10), in the crisis of the N kingdom in the years before its downfall (10:9), in the consequent political turmoil within Jerusalem (the unpopularity of the Davidic dynasty [7:13; 8:6] and the anarchy during a regency [3:4,

12]), in the pressure of foes from the E and W (2:6–7), and in the conquests of Assyria (10:11–34; 17:1–11; see Donner 1985:311).

2. Nonbiblical. Assyrian involvement in this conflict fortunately means that there are Assyrian records attesting to this war. Unfortunately, however, they are in a bad state of preservation. The annals of Tiglath-pileser III and two "summaries" offer a chronological order, although their interconnections are disputed. Other fragments relate events more in a geographical than a chronological order. P. Rost (1893) was able to make an edition based upon Rawlinson's publications and Layard's copies (some originals having been lost). New texts were published by Boissier (1896), Wiseman (1951; 1956; 1964), Levine (1972), while reliefs (with inscriptions) were published by Barnett and Falkner (1962). Rost's readings and edition were greatly improved by the studies and collations of Borger and Tadmor (1982), Weippert (1972; 1975; 1982), and Na›aman (1986). Several translations are available (*LAR* 1:nos. 769–821; *ANET*, 282–84).

The following seven texts directly relate to the Syro-Ephraimite war. The Assyrian list of eponyms (esp. *RLA* 2:430–31; *LAR* 2:437) and the Babylonian Chronicles (TCS 5:52; Brinkman 1984; 1968:229–32) help provide a chronological sequence for these texts.

(1) *Text A:* Rost lines 197–210 (1893:34–37) = *LAR* 1:no. 777 = *ANET*, 283 (left column, bottom).

(2) *Text B:* Rost lines 229–40 (1893:38–41) = *LAR* 1:no. 779 = *ANET*, 283 (right column, lines 17–33).

(3) *Text C:* Rost lines 211–28, and independent series (1893:38–41); cf. Tadmor 1968:180; Na›aman 1986:72.

(4) *Text D: LAR* 1:nos. 815–18 = *ANET*, 283–84; this text is completed by the parallel in Wiseman 1951:3 (ND 400).

(5) *Text E:* Wiseman 1956 (ND 4301 + 4305) and Wiseman 1964 (ND 5419), with K 2649 (cf. Kessler 1975:57; Borger and Tadmor 1982:245; Na›aman 1986:72).

(6) *Text F: LAR* 1:nos. 801–3 = *ANET*, 282.

(7) *Text G:* Barnett and Falkner 1962:pls. 62 (Gezer) and 70–71 (Ashtartu cf. 30b) (cf. also Weippert 1975).

B. Historical Events

1. Precedents for a Syro-Ephraimite-Judean Alliance. It is important to note that anti-Assyrian coalitions formed by Syro-Palestinian states are evident more than a century before the Syro-Ephraimite War. As early as the Battle of Qarqar in 853 B.C., Damascus (often called ARAM) appeared as a dominant power leading anti-Assyrian coalitions, coalitions extending beyond the Arameans sometimes to include Cilician states as well as Urartu to the north. Even this early, Israel and its king Ahab (of the Omride dynasty) participated in this anti-Assyrian coalition (*ANET*, 278–79). In 840 B.C. Israel under a new dynasty (Jehu) was compelled to render tribute to Assyria (*ANET*, 280). By 800 B.C. Israel was actually allied with Assyria against Damascus, and it is often assumed that Israelite foreign policy remained pro-Assyrian for as long as the dynasty of Jehu remained in power.

However, there is some evidence (extremely indirect and problematic) that, when pieced together, possibly suggests that several decades before the Syro-Ephraimite War (i.e., while the Jehu dynasty was still in power), Israel (and Judah) already had switched allegiances and sided with Damascus to oppose Assyrian interests. The Zakir stela (*ANET*, 655–56) is one piece of evidence; it reports that sometime in the first half of the 8th century B.C. Bar-Hadad of Damascus led of a coalition including Arpad and Sam›al against Hamath and its king Zakir. Hamath was delivered, something Zakir attributed to his gods, although Assyrian intervention was probably also a factor. The likelihood of Assyrian intervention is suggested by the subsequent fates of Damascus' allies. We know from other evidence that Arpad and its king Mati›ilu had become Assyrian vassals already by the time of Ashur-nirari V (754–746 B.C.; *ANET*, 532–33), while in Sam›al (which is sometimes also called ¸Ya›udi") the Panammu dynasty (which previously had been overthrown) was now restored when Tiglath-pileser III reinstated Panammu II, father of Barrakab) to the throne (*ANET*, 655).

The possibility that Israel and Judah may have participated in Bar-Hadad's coalition against Hamath (and therefore also against Assyria) is suggested by two textual fragments (K6205 + Rost 1893:20–24

[lines 123–41]) that, when joined together, form a second piece of evidence from Tiglath-pileser III's annals (*LAR* 1:no. 770 = *ANET*, 282–83 [the join occurs where *ANET* notes a "lacuna of three lines"]). (For a critique of this joining, see Na›aman 1974:especially p. 36.) This reconstructed text reports that an unnamed group (of kings) had taken nineteen districts and cities of the coast belonging to Hamath, and had given them to one "Azriau" (line 131, from the Rost 1893:20–24 fragment; "Azriau" is also mentioned on line 123 of the same fragment). The introductory portion of this text (the K6205 fragment) further identifies this individual twice as " (Azri)au" of "Yauda" and as (A)zriau" of "Yaudi."

The crucial issue concerns the identities of "Azriau" and "Yaudi." Assuming that these two fragments indeed belong together, opinions are divided as to whether this was (a) the same prince of Sam›al (Ya›udi) that Tiglath-pileser III removed when he reestablished Panammu II (cf. Briend and Seux 1977), or (b) Azariah (u) the king of Judah, also known as Uzziah (cf. Tadmor 1961; Haran 1962; Kessler 1975:53; Cazelles 1978). The cuneiform spelling of Judah and Yaudi are identical *(Ia-u-da-a-a)*.

Since Sam›al is never identified as Ya›udi in any other texts of Tiglath-pileser, this perhaps suggests a reference to the Judean king Azariah (u). However, it seems unlikely that Judah would be involved in (much less profit territorially from) a potentially anti-Assyrian military campaign so far to the north of both Israel and Phoenicia, and it is possible that the two fragments do not even belong together, in which case "Yaudi" (Judah) would not even be mentioned in connection with the nineteen districts of Hamath (Na›aman 1974). On the other hand, "Azriau" is not the sort of name one would associate with an indigenous N Syrian, since in form it is Israelite, not Aramean (Cogan and Tadmor *2 Kings* AB, 166). Furthermore, according to the elliptical biblical statement that "Jeroboam brought back Damascus and Hamath to Judah" (2 Kgs 14:28), it is possible that sometime after 800 his victory against Damascus extended Jeroboam's dominion as far as Hamath. Jeroboam of Israel, may then have compensated Judah for the harsh treatment it had received from his father Jehoash (2 Kgs 14:11–14), by ceding to Judah nineteen districts and towns captured from Hamath (a region that posed no immediate danger). This would explain Judah's involvement in Syrian affairs as far away as Hamath, where Assyria, Damascus, and Israel were already involved.

2. The Early Years of Tiglath-pileser III. Tiglath-pileser III ascended the throne in 745, after the assassination of his predecessor Ashur-nirari V. That autumn he directed his first annual campaign south against the Aramean tribes threatening Babylon. Apparently encouraged by the turmoil associated with the death of Ashur-nirari and by Tiglath-pileser's preoccupation with the south, an anti-Assyrian coalition was formed under the leadership of Urartu, Arpad, and the Cilician states, a coalition including Rezin of Damascus and Hiram of Tyre. As mentioned above, in 743 B.C. Tiglath-pileser defeated this coalition. The Panammu dynasty was restored to the throne of Sam›al, and Assyria annexed for itself the nineteen cities and districts previously given to "Azriau." Three more campaigns had to be directed against Arpad in the following years (742–740 B.C.); however, it was soon captured and annexed (cf. 2 Kgs 18:34; Isa 10:9). The faithful Hamath remained independent, but never recovered the nineteen cities and districts taken for Azriau and then subsequently annexed into Assyria. In 739 B.C. an Assyrian governor was appointed in Ulluba and a citadel *(birtu)* was seized. Tiglath-pileser III then consolidated his position in Syria a year later when he conquered Kullani/Kalnia (biblical Calneh/Calno; cf. Amos 6:2; Isa 10:9) and organized the new province of Kinalia (Weippert 1972:36; Kessler 1975:50–52).

About this time there was a change in Israelite policy. Shallum brought an end to the Jehu dynasty by assassinating Jeroboam's successor; however, scarcely a month later Shallum himself was assassinated by Menahem, who became a tributary of Tiglath-pileser (2 Kgs 15:19–20; cf. Levine 1972:18–19; *ANET*, 283). According to 2 Kgs 15:16, Menahem sacked Tiphsah (RSV "Tappuah"; likely Tapsakus in Bit-Adini; cf. 1 Kgs 5:4—Eng 4:24; Haran 1962:286), an action he probably undertook as a vassal of Tiglath-pileser.

For the next three years Tiglath-pileser was occupied with enemies to the E (Media, 737 B.C.) and N (Urartu, 735 B.C.). During this time he received tribute from Sam›al, Byblos, Tyre, Damascus (Rezin), Samaria (Menahem), and an Arabian queen (Zabibe) (*LAR* 1:no. 772 = *ANET*, 283), but not from the leper Azariah of Judah, or his son and co-regent Jotham. Because these tributes were heavy and Tiglath-

pileser's campaigns against Urartu (735 B.C.) were somewhat unsuccessful, the situation seemed favorable for yet another anti-Assyrian coalition to form in Syria.

3. The War. In N Israel, Pekah assassinated Menahem's son and successor Pekahiah and redirected Israel to embrace a more militantly anti-Assyrian policy. Israel joined a coalition of states including Kashpuna (on the coast southwest of Hamath), Tyre, Ashkelon, and, principally, Damascus; eventually Egypt itself appears to have been solicited to join (cf. the obscure allusion in Amos 4:10). Jotham king of Judah, probably remembering the delicate problems associated with the nineteen cities/districts of Hamath taken for (and then from) his father Azariah, refused to participate in this anti-Assyrian coalition. In retaliation, Damascus and Israel attacked him, and the so-called "Syro-Ephraimite War" began (2 Kgs 15:37).

Jotham died soon thereafter, and the issue of his succession was fraught with turmoil. Jotham's young son and successor Ahaz assumed the throne, apparently under great confusion and under the regency of the queen mother (cf. Isa 3:1–12). Even within Judah and Jerusalem, many viewed the Davidic dynasty unfavorably ("exhausting the patience" of God and man, according to Isa 7:13), and some "rejoiced in" (not RSV "melt in fear of") the plans of Rezin and Pekah. Certainly Philistia, which had suffered under Ahaz' grandfather Azariah (2 Chr 26:6), took advantage of the turmoil to strike against Judah (2 Chr 28:18).

At this critical juncture, the leaders of the coalition hoped to place on the throne of Jerusalem a non-Davidide, the son of their Tyrian ally Tubail (Phoen Ittoba‹al; Aram Tabe‹el). They attacked Jerusalem (2 Kgs 16:7; Isa 7:1), devastating the towns of Judah right up "to the gate of Jerusalem" (Mic 1:9–12). Rezin also incited Edom to recover Elath (2 Kgs 16:6, where Heb *›ĕdôm* is preferable to MT/LXX *›aram*). Both Moab (which was at war with Edom; Amos 2:1) and Ammon (which was taking the opportunity to expand its own borders; Amos 1:13) refused to join the anti-Assyrian coalition. But since Pekah had interests in Argob (the region between Damascus and Ammon; 2 Kgs 15:25) and in Moab (Arieh; cf. 2 Sam 23:20), he attacked Ammon to secure ties with Damascus; Israel was victorious at Lo-debar and Karnaim (near Ashtartu; Amos 6:13).

Tiglath-pileser III saw the danger and immediately responded to the young Ahaz' request for help. As usual, the Assyrian armies came down the coast "against Philistia" (734 B.C.):Kashpuna was taken, Tyre lost Malahab (see *Text E* in section A.2 above), Mitinti was enthroned in Ashkelon (see *Text F* in A.2 above), Hanuna of Gaza had to flee to Egypt, a stela of Tiglath-pileser was erected on the border of Egypt, and probably Idibi›ilu the Arab was established as governor (although this may have been done the following year). In short, Judah had been rescued and Egyptian interference had been blocked. Tyre decided to submit to Assyria and forsake his "covenant of brotherhood" (i.e., alliance; Amos 1:9) with the coalition, which was now at a stalemate. The following year (733 B.C.) Tiglath-pileser III advanced against Damascus itself, but a second campaign was needed a year later (732 B.C.) to destroy it. With the destruction of Damascus, the Syro-Ephraimite War came to a decisive end.

However, some questions still remain concerning the fate of Samaria, more particularly concerning the context of the assassination of Pekah and the enthronement of Hoshea, and its relationship to the loss of Gilead and Galilee. It is generally conceded that Pekah was assassinated in 732/1 B.C. *after* the fall of Damascus (Donner 1985:313), and that tribute ("10 talents of gold and *x* talents of silver") was then sent to Assyria by his successor Hoshea (*ANET*, 283–84; see *Text D* in A.2 above). Another text (*Text E* above) recounts that Tiglath-pileser was at Sharrabanu in Babylonia when Hoshea appeared before him, and the Sharrabanu conquest has been dated to between 731 and 729 B.C. (Borger and Tadmor 1982). If *Text E* and *Text D* refer to the same tribute, then it would confirm that Hoshea's nine-year reign (2 Kgs 17:1) should be dated 731–722 B.C.; and that Pekah was the last principal ally in the Syro-Ephraimite War to be killed.

However, it is possible that these texts refer to different tributes, and that Hoshea's reign began *earlier* (i.e., that Pekah was assassinated *before* the fall of Damascus). For example, according to 2 Kgs 15:30 Pekah was assassinated while Jotham—not Ahaz!—was still king of Judah (although Ahaz probably had been Jotham's co-regent since 734 B.C. This may be corroborated by the note that Ahaz (now king in his

own right) met Tiglath-pileser III *at Damascus* (2 Kgs 16:10), suggesting that this occurred after his father had died (and therefore after the assassination of Pekah) and either before or on the occasion of Damascus' capture (732 B.C.). From this, it is possible to date Pekah's assassination and the beginning of Hoshea's nine-year reign to 733 B.C., the same year that Tiglath-pileser's 9th campaign led to the devastation of 16 districts/towns surrounding Damascus (*Text A*), and of Gezer, Ashkelon, "the way of the sea," Galilee, and Gilead (*Text D*; cf. also Isa 8:23—Eng 9:1), with Samaria remaining untouched (*Text B;* Tadmor 1967). Thus, Hoshea's reign would have ended in 724 B.C., which seems to be corroborated by the biblical references suggesting that he was imprisoned for three years prior to 722/721 B.C., during which time Samaria had no king (2 Kgs 17:5; cf. Hos 13:10–11). This combined evidence suggests that Pekah of Samaria was not the last of Ahaz' antagonists to be removed, but rather that it was Rezin of Damascus, the principal architect of the Syro-Ephraimite alliance.

HENRI CAZELLES

SYRO-HEXAPLA. An early 7th-century translation of the Bible into Syriac. The Syro-Hexapla was the product of a reconciliation between the Monophysite patriarchates of Antioch and Alexandria, effected in 612–13. Athanasius of Antioch, in flight from the Arab conquest of Syria, reached Alexandria with five of his bishops, including Paul of Tella and Thomas of Harkel. At his command, a new Syriac version of the Bible was made from the Greek. The NT, the work of Thomas (with some assistance from Paul), is known as the Harclean Syriac. The OT was produced by Paul, helped by Thomas. The work was carried out in Alexandria between 613 and 617. There are dates in some manuscripts, to the effect that 3 Kingdoms was completed in February 616, 4 Kingdoms in the same year, the Minor Prophets and Daniel in January 617.

Paul's translation was made from the fifth column of Origen's Hexapla, the one containing the Septuagint (LXX). It included the diacritical symbols indicating those passages found by Origen in his Greek but not in his Hebrew text, and those added by him from elsewhere when he discovered that the LXX lacked material found in the Hebrew. The presence of variants from other Greek versions are recorded in the margins of one Syro-Hexaplaric manuscript. This has led to conjecture that Paul used the Hexapla itself. There is no other evidence to prove that the Hexapla was ever brought to Alexandria, where Paul certainly produced his version. Moreover, the manuscript used by Andrew Du Maes, the editor of the first printed edition, contained a colophon saying that the translation was made from a copy "made by Eusebius with the help of Pamphilus from Origen's books in the library of Caesarea." There seems no doubt that Paul's sources were good and, probably, annotated copies of Origen's fifth column.

The Syriac of the version is so extremely faithful to the Greek as to be highly unidiomatic. This, along with the quality of his sources and the preservation of many of Origen's critical symbols, renders Paul's translation of great importance in recovering Origen's text of the LXX—a vital task in the reconstruction of the history of the LXX.

There are several important manuscripts of the version. The most valuable is the Codex Ambrosiana, so-called because it is in the Biblioteca Ambrosiana at Milan. Originally in two volumes, the first was lost after its use by Du Maes. The second contains Psalms, Job, Proverbs, Ecclesiastes, Song of Solomon, Wisdom, Ben-Sira, the Minor Prophets, Jeremiah (with Baruch, Lamentations, and the Epistle of Jeremiah), Daniel (with Susanna and Bel and the Dragon), Ezekiel, and Isaiah. The codex was copied in the 8th century. A manuscript in Paris contains 4 Kingdoms. A whole group from the Nitrian desert, now in the British library, include Syro-Hexaplaric texts of Exodus and Ruth complete, and parts of Genesis, Numbers, Deuteronomy, Joshua, Judges, and 3 Kingdoms, as well as two copies of the Psalter (for an illustration of one, see Würthwein [1957:144–45]). There are a number of other fragments. There are also several lectionary fragments (though the Graecized nature of the Syriac cannot have made this version a popular one for reading aloud).

The Syro-Hexapla is also a rare witness to the genuine LXX text of Daniel, which in almost all Greek manuscripts has been supplanted by Theodotion's version.

The first printed edition of the version was by Du Maes, who in 1574 published *Josuae-historia illustrata.* He was followed by, notably, Norberg (1787), Bugati (1788 and 1820), and de Lagarde (1880).

SYRO-PALESTINIAN ARCHAEOLOGY. See ARCHAEOLOGY, SYRO-PALESTINIAN AND BIBLICAL.

SYRO-PHOENICIAN WOMAN (PERSON) [Gk *Syrophoinikissa* (Συροφοινικισσα)]. A Greek woman, born in Syrian Phoenicia, who begged Jesus to drive the demon out of her daughter as recorded in Mark 7:24–30 and Matt 15:21–28. This is the only example in the gospels of Jesus ministering to a woman who was in all likelihood a gentile. Perhaps Luke omitted this story because he found it too offensive to his gentile audience. Mark stresses this woman's political and national identity. She is called

a "Greek" (i.e., a Greek-speaking gentile or pagan) and a Syrian Phoenician by birth. Matthew simply calls her a Canaanite, which probably indicates her religious affiliation.

This story shows that Jesus' reputation as a miracle worker was widespread—even those in the region of Tyre and Sidon, well outside of Galilee, had heard about him. In both the Markan and Matthean versions the woman is depicted as persistent, and as having faith that Jesus can do something to help her daughter who is said to be possessed by an unclean spirit. Despite the fact that this woman has no claim on Jesus as Son of David since she is not a Jew, the story indicates that Jesus was willing to respond to her faith. His apparent initial unwillingness to help her is perhaps a reflection of his conviction that the focus of his ministry and mission was on his fellow Jews (cf. Matt 15:24). Herein we are perhaps meant to see a precedent for the later gentile mission of the Church.

SYRTIS (PLACE) [Gk *Syrtis* (Συρτις)]. The name of two dangerous, shallow gulfs off the coast of North Africa which briefly threatened Paul's ship as it was buffeted by a storm (Acts 27:17). While Paul was being taken under guard to Rome, a fierce storm called the "northeaster" (v 14) drove the ship away from Crete in a southwesterly direction, straight at the Syrtis. Even though these dangerous gulfs still lay hundreds of miles away, the sailors were so afraid of being driven aground in them that they took measures to guide the ship in a more westerly direction, eventually reaching Malta (Acts 28:1).

According the Strabo (2.5.20), the Greater Syrtis covered an area approximately 450–570 miles in circumference, and 170–180 miles in breadth. This is the modern Gulf of Sirte, off the coast of Libya. The Lesser Syrtis is the modern Gulf of Gabes off the coast of Tunisia. The ancient mariners' fears of running aground while still far out at sea are echoed in Dio Chrysostomus' warning: "Those who have once sailed into it find egress impossible; for shoals, cross-currents, and long sand-bars extending a great distance out make the sea utterly impassable or troublesome" (*Or.* 5.8–9).

MARK J. OLSON

T

TAANACH (PLACE) [Heb *taʿnāk* (תַּעְנָךְ)]. A Canaanite royal town founded ca. 2700 B.C., usually identified with Tell Tiʿinnik (M.R. 171214), a pear-shaped mound 320 m N–S, 137 m E–W at its widest. Strategically located in the upper Cenomanian-Turonian foothills ca. 150 m above the Plain of Jezreel. Tell el-Mutesellim (Megiddo) is visible 8 km to the NW and modern Jenin, in which is located Tell Jenin (En-gannim), can be seen 10 km to the SE. Taanach differs from both Jenin and Megiddo in that it is not located at the point where a natural pass enters into the Jezreel, nor does it possess a spring, but survives on systems of water collected into cisterns. The site fronts on the SW edge of the down-faulted alluvial Jezreel Plain which was a seasonal swamp in antiquity, because of the poor drainage of the Kishon. The mean annual temperature is ca. 22°C (72°F) with an average of ca. 510 mm (20 inches) of annual winter rainfall. Despite gaps, the continuity of name and occupation is evident in the presence today of the village of Tiʿinnik on the SE slope of the tell.

A. Written Sources

1. Biblical References. In the currently accepted Massoretic text (Codex Leningradensis) the seven occurrences of the town name are uniformly rendered as *taʿnāk.* The usual transcription, Taanach, drops the *ʿayin* and spirantizes the final consonant. The LXX B text has several variants: *Tanach, Thanak, Thanaach.* Originally a town in Issachar and Asher, Taanach was later assigned to Manasseh (Josh 17:12; 1 Chr 7:29). Though the king of Taanach was one of 31 Canaanite rulers Joshua (12:21) smote, "Manasseh did not drive out the inhabitants of … Taanach and its towns" (Judg 1:27). The victory hymn of Deborah describes that the battle against the Canaanite forces led by Sisera was joined "at Taanach, by the waters of Megiddo" (Judg 5:19). The biblical description of this mid-12th century encounter contains no further information about either the contemporary existence or fate of the two towns mentioned. Later, however, "when Israel was strong" (Judg 1:28), it subjected the local population to forced labor. In the 10th century, Solomon included Taanach in the fifth administrative district governed by Baana, son of Ahilud (1 Kgs 4:12). The town was assigned to the Kohathite Levites of W Manasseh sometime after the 10th century B.C. (Josh 21:25).

2. Non-Biblical References. To date, no written documents refer to Taanach before the 15th century B.C. The Egyptian account of the Battle of Megiddo (ca. 1468 B.C.) locates Taanach at the exit into the Jezreel of one of three possible routes. The reference is most likely to a route from today's Baqaʿ to Yabad, past Kufr Qud and down the Wadi Hassan into the Jezreel W of Kufr Dan. The S wing of the Asiatic army was mustering "in Taanach." The "Palestine List" on Pylon VI of the temple of Amon at Karnak enumerates the towns and princes who found refuge in Megiddo and includes Taanach (No. 42). Elsewhere in the same temple is a mutilated list which includes Taanach (No. 14) among the towns in Palestine conquered in the 5th year of Rehoboam of Judah (ca. 918 B.C.) by Shishak, founder of the 22nd Egyptian Dynasty. An 18th Dynasty hieratic papyrus, Petersburg 1116A, lists Taanach among the eleven towns in *sa-hi* (Palestine) from which representatives of the *maryannu*-warrior class were sent to the

Pharoah's court. If Amarna Letter 248 is from Taanach, following Knudson's restoration of line 14, its prince had an Indo-Aryan name, Yashdata. He was allied with the prince of Megiddo, Biridiya (EA 245:12, 15), against Labayu of Shechem. In the 4th-century-A.D. *Onomasticon* of Euseubius, Taanach was described as a "very large village" either four (98.12) or three (100.7) miles from Legio (el-Lejjun). Crusader documents of the 12th and 13th centuries, recording disputes among ecclesiastics regarding the distribution of produce from villages assigned to either a monastery or church, indicate that "Tannoch" was colonized by and thus indentured to the monastery of St. Mary in the Valley of Jehoshaphat, Jerusalem. The Ottoman census of 1596 revealed that there were only 13 (?) taxable males in the village of Ta'inniq. A visit by S. Wolcott, an American (published in 1843), reported the existence of "a mean hamlet" at Ta'annuk. The only 19th century explorer to visit and record the visible ruins and living architecture of "Ta'annak" is some detail was V. Guerin who noted evidence of extensive former occupation on the tell and its S slope. He was the first to suggest that the foundation of the present mosque was a Byzantine church.

B. Excavation History

In the same year that Macalister began work at Gezer (1902) the first major archaeological excavation in N Palestine was initiated at Taanach by Ernst Sellin, an Old Testament scholar from Vienna. He excavated ca. 16 percent of the tell surface in ca. 20 weeks spanning three seasons between 1902 and 1904 and promptly published two major reports (1904; 1905). Sellin divided the history of the site into four major periods of occupation, each with a sub-phase. He thought the earliest city was Amorite and should be dated between 2000 and 1600 B.C. Period II saw the site gradually taken over by the Israelites until it became a fortress city under Solomon. Period III dated to the time of the N Kingdom until its incorporation as an Assyrian province in 722 B.C. Period IV followed a long gap in occupation until ca. A.D. 1000–1200, the main evidence for which was a cluster of rooms on the crest of the mound Sellin identified as the "Arab Fortress." Sellin's long trenches criss-crossed the N half of the tell in an unsuccessful search for the city walls. Instead he located six large buildings which he designated "fortresses." Notable among a rich collection of artifacts was a cult stand and twelve cuneiform tablets.

The second major excavation was fielded by Paul Lapp in three seasons: 1963, 1966, and 1968. In ca. 22 weeks in the field, this expedition excavated ca. 6 percent of the surface of the tell. In addition to discovering the fortification system and redating the stratification history of the site, this expedition uncovered two cuneiform tablets (one alphabetic) and a second cult stand. Apart from preliminary excavation reports by Lapp (1964, 1967a, 1967b, 1969) studies of the two new cuneiform tablets have been published (Hillers 1964; Glock 1971). A third program of study of the site began in 1982 with an ethnoarchaeology examination of the present village (Ziadeh 1984) and continued in 1985–87 with the excavation of parts of the Mamluke-Ottoman village on the E slope of the tell (Glock and Ziadeh 1986). This work has been directed by A. E. Glock.

C. Results of Excavations

This review of the material culture of Taanach on the tell is largely based on the ASOR excavations which were necessarily limited to the SW quadrant of the mound except for the reexamination of the "NE Outwork." Four of the five areas excavated were, however, adjacent to Sellin trenches, thus making possible the correction of the earlier work.

1. The Early Bronze Town, ca. 2700–2300 B.C. The physical evidence that Taanach was a prestigious center in the middle centuries of the 3d millennium B.C. is the massive fortification system discovered on the S and W sides of the mound. On the S, the earlier of two city walls was an average of 4.20 m thick and preserved ca. 4 m high at the point where it was realigned during rebuilding. The SE corner of the defense system was vulnerable to both natural and military forces, the latter due to the probability of a city gate on the SW. Against the exterior of the first city wall was a complete rectangular tower bounded by walls ca. 2 m wide separated from a fragmentary second tower by a 2.75 m space through which there may have been an entrance. The second-phase city wall was fronted by a deep *huwwar* glacis revetted by a heavy, stepped retaining wall making the defenses on the S in this third phase more than 11 m thick. In the final phase the entire area was covered over with a beaten earth glacis against the foundation of a

massive 20 × 10 m tower surmounting the second-phase and third-phase fortifications. It has been argued that the early glacis at Taanach indicates that this form of "defense" may have been an indigenous Palestinian development (Parr 1968). Limited exposure of the contemporary outer defense system in two places on the W side of the tell showed that a similar massive city wall bounded the site high on the steep slopes. So far only meager evidence of the layout of the interior of the EB city has emerged. Immediately inside the W city wall, a small benched room appeared adjoining a wide courtyard replastered at least six times. Farther E and S, two phases of domestic architecture appeared over bedrock in elements of three (?) living spaces linked by common walls. Unfortunately, both phases were sufficiently pitted by later activity so that walled separations are often conjectural. Nevertheless, several tabuns and hearths, but no cisterns, as well as the range of storage and cooking wares, leave no doubt about the function of the space. More of the city plan will be known once the debris below the MB *insula* to the W has been excavated. Albright (1944: 15) has redated the so-called "Ishtar-washur Fortress" excavated by Sellin to late EB II.

2. Middle Bronze III to Late Bronze IIA, ca. 1700–1350 B.C. A small exposure on the W side of the tell revealed two phases of the earliest casemate defense walls in Palestine. The width of the wall grew from 3.75 m to 4.5 m, the earlier small stones replaced by large stones in phase two. Nowhere else in the areas excavated was this wall preserved. Several phases of a lime plaster surface of a glacis system was evident everywhere against the outer slope of the tell below the walls. The second of three glacis was cut by the foundation trench excavated for the construction of the West Building (Sellin's "Westburg"). This large building (ca. 20 × 20 m) is unique in that it is constructed of an imported hard limestone. The 2d millennium architecture at Taanach is best preserved inside the badly eroded defenses. The most important exposure was in the 16 m wide space between the W casemate wall and the N–S street which led to the West Building. In this space was a dense cluster of 18 small rooms. Child burials were below the floors of these rooms. Assorted jewelers' tools suggest that at least one room had been a workshop. The second-phase reconstruction in the early 16th century B.C. followed the lines of the earlier building but widened the walls from one to two stones. W of the street, an E–W wall ca. 4 m high retained debris along the N side of a stepped (?) approach to a subterranean plastered chamber, 3.5 m wide and high. An arched entrance, 3.5 m high cut into bedrock, led to steps descending 10 m. The function of the room remains obscure though it may have been an aborted effort to reach a spring. Though today there is no spring flowing at the site, the presence of a fault line just N of the tell suggests that in antiquity one may have existed. The first cisterns appear in the MB III houses. It was in the debris that accumulated after the abandonment of the rooms along the N–S street that another cuneiform tablet (TT 950) was found.

In summary, more is known about this period than any other at Taanach. The reoccupation of the site after a gap of 600 years was gradual. The earliest evidence appears to be of transhumants, followed by more permanent settlers (indicated by flimsy walls) until in the early 16th century (to judge from the W defenses) when a substantial strengthening of existing architecture occurred. There seems to have been a partial abandonment following the battle of Megiddo, ca. 1468 B.C. The presence of Mycenaean III A 1 and 2 and early III B pottery implies continuity into the 14th century though the architectural remains are fragmentary at best.

3. Iron Age through the Persian Period, ca. 1200–400 B.C. The evidence for a settlement in this period is scattered, and implies that the site may not have been intensively settled. Only on the W side of the tell was a small portion of a 12th-century city wall (4.25 m wide) exposed. Three 12th-century houses, one on the S end of the tell, a second ca. 140 m NW, and a third ca. 60 m farther NW (the location of the alphabetic cuneiform tablet), though partially visible, were constructed with paved areas, tabuns, and pillared partitions. The courtyard of the so-called Drainpipe Structure in the S contained a stone trough, plastered basin, feeding bins, tabun, hearth, as well as a cistern more than 12 m deep fed by a series of interlocked, vertical, ceramic drain pipes leading from the roof to a channel which emptied into the cistern. Preservation of this building was due to a late 12th-century collapse of the calcined mudbrick superstructure. Adjacent to the long trench in which Sellin found a cult stand in 36 fragments, the ASOR excavation uncovered a 10th-century structure laden with a large cache of pottery, a figurine mold (Hillers 1970), 140 sheep astragali, 58 ceramic loomweights, and stone and metal tools. Lapp's cultic

interpretation of this assemblage has been challenged (Fowler 1984). Nearby in a cistern, a new cult stand with figures in relief on 3 sides of four panels was found in a 10th-century context. See Fig. TAA.01. An addition to the defense system on the N slopes of the tell in the 9th century consisted of a rubble-filled stone platform surrounded with a pavement. This was Sellin's "NE Outwork." Very little evidence has been uncovered for the remainder of the Iron II period. Storage pits and two incomplete rooms belong to the Persian period.

4. Late Roman and Byzantine Periods, A.D. 300–650. This period is abundantly evident from surface surveys in the village and nearby region (Ahlstrom 1978; Glock 1983b). A small portion of the Byzantine town which extends the entire length of the E slope was excavated in 1987. A curbed and paved ramp, an impressive platform, a room destroyed by fire and filled with storejars and bronze objects were excavated.

D. Special Finds

1. Cuneiform Tablets. A small but complete alphabetic cuneiform tablet was found in a 12th-century destruction layer. The preliminary publication (Hillers 1964) interpreted the document as a receipt or invoice for a shipment of grain or flour to a *Kokaba'*. Though some differences of interpretation have emerged (Cross 1968; Dietrich, Loretz, and Sanmartin 1974), Hillers seems to be essentially correct (Weippert 1966; 1967). In 1968, the ASOR excavation recovered one Akkadian tablet (TT 950) and two blanks in an area more than 100 m from where Sellin found seven tablets and five fragments in, and near, a ceramic box. The Taanach archive of thirteen documents consists of four letters (ca. 100 readable lines) and nine name lists containing ca. 80 personal names dating to the mid-15th century B.C. It is not clear what function the name lists may have served. B. Mazar (Maisler 1937: 48) has suggested that it was a list of taxpayers or soldiers. The ethnic diversity reflected in this onomastica consists of ca. 62 percent NW Semitic, ca. 20 percent Indo-Aryan, and ca. 18 percent Hurrian-Anatolian names (Gustavs 1927–28; Glock 1971; Mayrhofer 1972). Recent study of the letters (Glock 1983a) shows that Hrozny's original transcription (in Sellin 1904; 1905) is more reliable than Albright's (1944). The four letters are from three correspondents to the ruler of Taanach, Talwashur. Two letters are from local rulers requesting intercession for an arranged marriage, subsidy (50 silver shekels), and various kinds of equipment (chariots, bows, bowstrings, copper arrows). Two other letters are from one Amanhatpa who may be co-regent with Thutmose III, the later Amenhotep II (Malamat 1961). In any case, the correspondent reprimands the ruler of Taanach for not paying his respects by visiting him in Gaza, the Egyptian base in Palestine. In another letter, he requests that Talwashur supply specialized military personnel together with horses and chariots for the Egyptian army in Megiddo.

2. Taanach Cult Stands. Though fragments of several were found, one large (90 cm high) cult stand was excavated by Sellin. Two side panels of its hollow form were crudely decorated with a series of five superimposed lion and griffin figures in relief with human and animal heads projecting from the facade. Lods (1934) debated the possibility that it was simply a stove decorated with mythological symbols, but ultimately preferred to interpret the structure as serving a religious artifact. In 1968 the ASOR excavation recovered a smaller (60 cm high), but more carefully constructed stand in four panels. See Fig. TAA.01. In the top panel above a bovine form, the winged sun disk has been interpreted as a symbol for Baʿal, while the nude female leading two lions on the bottom panel is read as his consort, Asherah (Hestrin 1987).

The location of the site, and evidence from the excavation, may combine to explain the function of Taanach, which may have been different in each major period of occupation. A hypothesis can be suggested for the 3d–2d millennia B.C. Even though the site is not located at the exit of an easily traveled wadi and is thus less accessible than Megiddo or Jenin, it nevertheless enjoys from its crest a panoramic view of the Jezreel Plain to the N. In the EB the site may have been watered by a spring, although in the 2d–1st millennia B.C., the spring was not functioning; it was necessary to resort to cisterns and water collection systems. From the same period there is an unusual quantity of material evidence for metallurgical activity (Stech-Wheeler et al. 1981). The Taanach Akkadian archive remains the largest in Palestine. The existence of two tablet blanks supports the idea that at least one scribe was resident. Though the site was well defended, it appears that in this period there existed considerable open space

within the walled town. In short, between the 17th and 14th centuries Taanach served as a protected center for professional and technical work supporting the political power located at neighboring Megiddo.

TAANATH-SHILOH (PLACE) [Heb *ta›ănat šīlōh* (תַּאֲנַת שִׁלֹה)]. A town on the NE border of Ephraim (Josh 16:6), SE of Shechem as one may determine from a comparison of the border description in Josh 16:6–7 with that in Josh 17:7. The ancient place name probably survives in the name Khirbet Ta‹na. Consequently, either of the two neighboring sites Khirbet Ta‹na et-Taḥta (M.R. 187173) or Khirbet Ta‹na el-Foqa (M.R. 185175) affords a possible identification for the ancient town (*HGB*, 158). Both sites have yielded material evidence of Israelite occupation during the premonarchic and the monarchic periods. Eusebius identifies *thēnath* of the tribe of Joseph (i.e., Taanath-Shiloh, cf. Josh 16:5–6 LXX A) with *thēna,* a town still existing in his time, located ten miles in an eastward direction from Neapolis apparently on a Roman road leading to the Jordan (*Onomast.* 98:13). This information accords well with the actual location of Khirbet Ta‹na et-Taḥta, but nonetheless it does not offer decisive evidence for identifying this location with ancient Taanath-Shiloh. It may be that Eusebius was not aware of Khirbet Ta‹na el-Foqa because it was unoccupied in the Roman period and because the Roman road ran well to

the S of it with the result that the place name did not appear in the official Roman lists of places along the highways from which Eusebius may have drawn his information.

WESLEY I. TOEWS

TABBAOTH (PERSON) [Heb *ṭabbāʿôt* (טַבָּעוֹת)]. Head of a family of Nethinim (Temple servants) who returned from the Babylonian exile to Jerusalem with Zerubbabel and Jeshua between 538 and 520 B.C.E. (Ezra 2:43; Neh 7:46; 1 Esdr 5:29). The name means "signet rings" (cf. Exod 28:23). It could reflect the clan's role within the guild of Nethinim or be a nickname that had become a family name over time—a likely development if the Nethinim (many of whom possess odd names) were originally foreigners or of low descent. As members of the guild of Nethinim, the family of Tabbaoth would have had a special role in the Temple cult, perhaps assisting the Levites. Whatever their origin, during the postexilic period the Nethinim, as cultic personnel, were considered members of the congregation. Like the Levites, they had been devoted to cultic service the precise nature of which can not longer be identified. The size of Tabbaoth's family, its origins and specific role are no longer discernible. Together with thirty-four more families of Nethinim and ten of families of Solomon's servants, the group included 392 members (Ezra 2:58; Neh 7:60) or 372 (1 Esdr 5:35). See Blenkinsopp *Ezra-Nehemiah* OTL; Williamson *Ezra, Nehemiah* WBC.

TABBATH (PLACE) [Heb *ṭabbāt* (טַבָּת)]. A site related to the Midianite flight after Gideon's surprise attack (Judg 7:22). It has been identified with Ras Abu Tabat on the Wadi Kufrinje, halfway between Jabesh-gilead and Succoth. The name may be derived from the root *ṭbr* (BDB, 371–72), of uncertain meaning, but the noun *ṭabbûr* means "highest part, center."

Gideon's surprise attack routed the Midianites from the Jezreel Valley toward Zererah to the border of Abel-meholah by Tabbath and beyond. Gideon's pursuit took him to Succoth, Penuel, and Jogbehah (Jubeihat, 15 miles SE of Penuel). The Midianites rallied near Karkor (Judg 8:10; Qarqar in the Wadi Sirhan, 150 miles from Jezreel).

Wright (*WHAB*, 65, map IX) shows Tabbath S of Jabesh-gilead and Abel-meholah and N of Zarethan and Succoth in the mountains E of the Jordan River. Cohen (*IDB* 4:497) identifies Tabbath with Ras Abu Tabat, which he postulates was the vicinity of Karkor and Heres. However, the Midianites did not retire and rally their forces near Tabbath, but at Karkor, which was fairly deep in the desert.

The attempt to locate Tabbath largely depends upon the locations of several others sites mentioned in the narrative: Beth-shittah, Zererah, Abel-meholah (Judg 7:22), and Succoth (Judg 8:4–8). Complicating the analysis is the fact that the identifications of these sites are also unclear.

The location of Beth-shittah is unknown, though Smick (1973: 81) and Aharoni (*LBHG*, 294 n. 222) say that both it and Abel-meholah were near fords of the Jordan. In Judg 7:24, Gideon calls on Ephraimites to capture the fords of the Jordan. Boling *(Judges* AB, 48, map 2) suggests Beth-shittah is on the E bank on the Wadi Kufrinje E of Zarethan, several miles from the Jordan River.

Zererah is usually identified with Zeredah and both are equated with Zarethan (though there is a Zeredah in Ephraim; 1 Kgs 11:26). Zarethan is often identified with Tell es-Saʿidiyeh (M.R. 204186) on the Wadi Kufrinje, but an alternate location for Zarethan is to the S at Tell Umm Hamad (M.R. 205172) on the N bank of the Jabbok. Pritchard (1987: 96–97) identifies Zarethan with Saʿidiyeh (however, the first end-paper map shows Zarethan on the S side of the Jabbok). Pritchard (1985: 3) and Tubb (1986) both say that the biblical identity of Tell es-Saʿidiyeh is uncertain.

Abel-meholah has been located either 12 miles S of Beth-shan at Tell el-Hilu (M.R. 197192; Smick 1973: 168; Pritchard 1987: 99, 113; Boling *Judges* AB, 48) or at Tell Maqlub (M.R. 214201) on the Wadi

Yabis E of Jabesh-gilead, 20 miles from Gideon's camp at the spring of Harod. Aharoni (*LBHG*, 284 nn. 222, 313) notes the el-Hilu location for Abel-meholah, but says that it should be identified with Tell Abu Sus (M.R. 203197) where are two fords. Smick (1973: 168) also notes the possible location of the site at Tell el-Meqberah, half way between the Yabis and Kufringe wadis. Soggins (*Judges* ET, OTL, 144) suggests additionally, Tell Abu Sifri, on the W bank of the Jordan, 3.5 miles W of Wadi Yabis.

Succoth is mentioned as one of the towns through which Gideon passed in pursuit of the Midianites, which would imply that Tabbath should be located somewhere along the route from Jezreel to Succoth. Succoth is often identified with Tell Deir ʿAlla (M.R. 208178; Pritchard 1987: 247), N of the Jabbok, though Franken (*EAEHL* 1: 321–24) prefers to identify Succoth with Tell el-Ekhsas, 1.5 miles to the W of Deir ʿAlla (cf. Aharoni *LBHG*, 284 n. 224). Gideon's route of pursuit then passed into the hill country to Penuel and into the desert.

The location of Tabbath is unclear since its identification relies heavily upon the location of these other sites, the location of which are matters of dispute, and the logic of which makes for some confusion in this narrative. If the Midianites fled up the Wadi Yabis (Abel-meholah = Tell Maqlub) or up the Wadi Kufrinje (Zererar = Tell es-Saʿidiyeh and Tabbath = Ras Abu Tabat), one would expect Gideon to pursue them along one of these routes, but he took the Jabbok, which leads E and then turns S toward Amman. It thus gives access to the desert and the Wadi Sirhan. Perhaps in their panic from the surprise in Jezreel, the Midianites fled whichever way they thought was open to get back to the E desert, but Gideon may have known where they were going and took the more direct route by-passing the forests of Gilead. The Midianites, too, however, may have fled through the Jabbok wadi system, in which case Gideon's route would have followed them.

HENRY O. THOMPSON

TABEEL (PERSON) [Heb *ṭābĕʾal/ṭābĕʾēl* (טָבְאַל/טָבְאֵל)]. **1.** Father of the unnamed person whom the kings of Syria and Israel planned to make king of Judah in place of Ahaz at the time of the Syro-Ephraimite war, ca. 735–734 B.C.E. (Isa 7:6). Several possibilities have been put forth for his identity. All theories assume that Tabeel is the name of this would-be ruler's father or tribal ancestor. The most important options stem from the interpretation of two Assyrian cuneiform documents. In an 8th-century-B.C.E. letter discovered at Nimrud, an Assyrian official named Qurdi-Aššûr writes about "the messenger of Ayanûr, the Tabeelite [KUR *Ṭa-ab-i-la-aya*], Ezazu by name" (Saggs 1955: 132; Albright 1955: 34). Albright applied this text to Isa 7:6 and assumed that Tabeel was the name of a tribe and its land which was located in NE Palestine or SE Syria. Hence, "the son of Tabeel" was the son of a Judean king and a Tabeelite princess (Albright 1955: 35). Mazar located the land farther to the S in S Gilead and assumed that it referred to the large estate of a Judean noble family whose ancestor was Tabeel. This family eventually became the important Tobiad family in postexilic Judah, since during the reforms of Josiah the divine element of many names was changed from "El" to "Yah." Hence, Tabeel became Tobiyahu (Mazar 1957: 236–38). Both Albright and Mazar accepted Alt's theory that the "son of Tabeel" referred to the holder of a hereditary state office, following traditional models in Israel and Ugarit (*KlSchr* 3: 212). However, Alt's theory does little to clarify either of their positions. Furthermore, Albright's interpretation of the Assyrian letter is controversial. A second Assyrian document, a vassal list of Tiglath-pileser III on a stele found in Iran and dated to 737 B.C.E., is the source for an entirely different theory. This list names Tubail *(Tu-ba-ìl)* as the king of Tyre in Phoenicia, immediately following Rezin of Damascus and Menahem of Samaria (Levine 1972: 40–41). Vanel argued that there was an alliance between Damascus, Samaria, and Tyre and that the ruler of Tyre (the son of Tabeel) was offered the throne in Jerusalem in exchange for his support in the anti-Assyrian coalition (Vanel 1974: 17–24). The Heb form *ṭābĕʾal* was

no doubt originally *ṭābĕ‹ēl* (“God is good”; cf. LXX *tabeēl* and #2 below). The name as given in the present text is intended by the MT as a form of ridicule (“not good”).

2. A Samaritan official in the Persian period (Ezr 4:7 [Heb *ṭābĕ‹ēl*] = 1 Esdr 2:12—Eng2:16 [Gk *tabellios*]). Along with his colleagues Bishlam and Mithredath, he sent a letter to the Persian king Artaxerxes I (465–425 B.C.E.) requesting the king to halt the rebuilding of Jerusalem by those who had returned from exile. The request, which suggested that these Jewish inhabitants of Jerusalem would incite rebellion and the withholding of taxes, was successful.

TABERAH (PLACE) [Heb *tab‹ērâ* (תַּבְעֵרָה)]. A place on the wilderness itinerary of the Israelite,

three days N of Mount Sinai (Num 10:30; 11:3; cf. Deut 9:22). The inhospitable locale led the people to complain, angering Yahweh. This leads Yahweh to send down fire to burn *(b‹r)* part of the camp. This action provides the Hebrew verbal root from which the name “Taberah” (“burning”) is constructed.

An itinerary of Israel’s campsites in the wilderness is included in Numbers 33, but it omits Taberah, skipping from Sinai to Kibroth Hattaavah (v 16). The latter site is mentioned in 11:34–35 as a location where Yahweh again punished his people for complaining. Since no record is made in Numbers 11 of a move from Taberah to Kibroth Hattaavah, these could be alternative names for the same location. However, Deut 9:22 seems to list them as separate sites (*GTTOT*, 255). Possibly one of the names designates an area and the other a specific site within the area (Wenham *Numbers* TOTC, 106). No compelling identification of the geographical location of Taberah has been proposed.

DAVID W. BAKER

TABERNACLE [Heb *miškān* (מִשְׁכָּן)]. The Israelite tent sanctuary frequently referred to in the

Hebrew Bible. It is also known as the tent of meeting (Heb *›ōhel mô‹ēd*) and, occasionally, as the Tabernacle (or tent) of testimony (*miškan ha‹ēdût*). It is the central place of worship, the shrine that houses the ark of the covenant, and frequently it is the location of revelation. It is presented in biblical narrative as the visible sign of Yahweh’s presence among the people of Israel. More verses of the Pentateuch are devoted to it than to any other object. It contains the ark, an incense altar, a table, a seven-light candelabra, an eternal light, Aaron’s staff that miraculously blossomed (Num 17:23–26), the vessels that are used by the priests, possibly a container of manna (Exod 16: 33–34), and a scroll written by Moses (*sēper hattôrâ*).

———

A. In Biblical Narrative

The Tabernacle’s history, as recounted in the biblical text, covers between six and seven centuries. The construction of the Tabernacle is commanded in a revelation to Moses at Mt. Sinai (Exodus 26). The materials are then donated by the people, the component structures and fabrics are fashioned (Exodus 36), and the Tabernacle is erected and consecrated (Exodus 40). In an apparent contradiction or confusion of

sequence, it is reported that the Tabernacle is moved outside the camp in the wake of the golden calf episode (Exod 33:7–8), but this relocation comes before the report of the Tabernacle's actually being built (see below). In any case, once the Tabernacle is completed, it becomes the place of communication between the deity and Moses for the remainder of Moses' life. The law requires that all sacrifice and the execution of several other practices must take place at its entrance (Lev 1:3, 5; 3:2, 8, 13; 4:5–7, 14–18; etc.).

During the journey from Mt. Sinai to the promised land, the Tabernacle is disassembled and transported whenever the people travel, and it is erected again whenever they stop to camp. Joshua stands guard inside it. Major events occur in it or in its precincts: the inauguration of the priesthood (Leviticus 8–9), the deaths of Aaron's sons Nadab and Abihu (Leviticus 10), the reprimand of Aaron and Miriam concerning Moses' Cushite wife (Numbers 12), the divine decision that the generation of the Exodus is to die in the wake of the spies episode (Num 14:10–35), the confrontation in the Korah episode (Num 16:18–19), the plague in the wake of the Korah episode (16:6–15), the miraculous flowering of Aaron's staff (16:16–25), the divine command in the Meribah episode (20:6–8), the sexual offense and Phinehas' zealous act at Peor (25:6–8), the transfer of leadership from Moses to Joshua (Deut 31:14–23), and, at the conclusion of the Pentateuch, the placement of the scroll of the *tôrâ* there beside the ark (31:24–26).

Following the arrival in the land and the conquest under Joshua, the Tabernacle is erected at SHILOH (Josh 18:1; 19:51). It is recognized as the only permissible place of sacrifice (22:19, 29). Shiloh and the Tabernacle then retain the status of being Israel's religious center through the age of Eli and Samuel (1 Sam 2:22). In the course of a defeat of the Israelites by the Philistines, the ark is separated from the Tabernacle; the ark is located at the house of Abinadab at Gibeah (7:1) while the Tabernacle remains at Shiloh. Following the destruction of Shiloh (not reported in the narrative books but referred to in Jer 7:12, 14; 26: 6, 9), the fate of the Tabernacle is partly unclear. According to the book of Chronicles, the Tabernacle somehow comes to be located at the high place of Gibeon. When King David brings the ark to Jerusalem he houses it in a new tent (1 Chr 16:1 = 2 Sam 6:17), but he still sends the chief priest Zadok and his retinue to Gibeon to perform the nation's sacrifices (as commanded in Leviticus 17) at the Tabernacle (1 Chr 16:39–40; cf. 21:29). The Chronicler's account of David's sacrifice at the threshingfloor of Ornan explains that David performs the sacrifice at this location only because he is unable to get to the Tabernacle at Gibeon at the time (21:28–30). The Chronicler's history also reports that this division of locations is the case at the beginning of King Solomon's reign, stating that the ark is in Jerusalem in David's tent but that Solomon and the people go to sacrifice at the Tabernacle at Gibeon (2 Chr 1:3–6). The books of Samuel and Kings are silent as to the location of the Tabernacle at this point. They give a report that Adonijah is killed at the "tent of Yahweh" (1 Kgs 2:28–30), but it is not clear whether this means the Tabernacle or the tent of David. However, both Chronicles and Kings report that when Solomon dedicated the Jerusalem Temple, he not only brought the ark to the Temple but also the tent of meeting as well (2 Chr 5:5 = 1 Kgs 8:4).

In the book of Kings, the Tabernacle is never mentioned again after this. The book of Chronicles, though, consistently pictures the Tabernacle as located somewhere inside Solomon's Temple. The Chronicler reports that David appoints Levites who serve at "the Tabernacle of the tent of meeting" until Solomon builds the Temple (1 Chr 6:16–17, MT). There follows a list of these persons whom David appoints, and the list concludes with the notation that "their brothers the Levites were appointed to all the service of the Tabernacle of the house of God" (*miškān bêt haʾĕlōhîm*; 16:33, MT). The Levites' appointment to keep the charge of the tent of meeting is again explicitly identified as part of the service of the house of Yahweh (1 Chr 23:32). Later, in the Chronicler's report of King Joash's efforts to repair the Temple, Joash demands of the priests that they acquire funds for the support of "the tent of the testimony (*ʾōhel haʿēdût*, 2 Chr 24:6). Likewise in the Chronicler's account of King Hezekiah's repairs and renewal of worship at the Temple (2 Chr 29: 5–7), Hezekiah speaks of the Tabernacle as present in the Temple:

> Now sanctify yourselves and sanctify the house of Yahweh, God of your fathers, and take the impurity out of the holy place, for our fathers trespassed and did what was bad in the eyes of Yahweh our God, and they left him, and they turned their faces from Yahweh's Tabernacle and turned their backs. They

also closed the doors of the hall and put out the lights and did not burn incense and did not offer burnt offerings in the holy place *(qodeš)* of the God of Israel.

The reference to the Tabernacle *(miškān)* in this verse is frequently taken as figurative or as meaning God's "habitation" generally, but all of the other items mentioned in the passage (the house, the holy place, the hall, lights, incense, and offerings) are concrete and literal. The context therefore indicates that this account is part and parcel of the Chronicler's record of the Tabernacle's presence in the Temple in Jerusalem. The references to the Tabernacle in Chronicles end here at the account of the reign of Hezekiah, and none of the narrative books of the Hebrew Bible gives any indication of the fate of the Tabernacle beyond this point. However, a Psalm (74:7) speaks of the Tabernacle as having been destroyed along with the burning of the Temple: "They cast your Temple into the fire,/ To the ground they profaned your name's Tabernacle."

The book of Lamentations (2:6–7) also speaks of the destruction of the Tabernacle along with the Temple:

> And he has dealt violently with his pavilion as with a garden,
> He has destroyed his [tent of] meeting.
> Yahweh has caused holiday and sabbath to be forgotten in Zion,
> And he has spurned in his angry indignation king and priest.
> The Lord has cast off his altar,
> He has abhorred his Temple.
> He has closed up the walls of her palaces in the enemy's hand,
> They have made a noise in Yahweh's house as on a holiday.

The reference to a pavilion *(sukkâ)* in the first line is consistent with other references to a *sukkâ* as a structure in the interior of the Tabernacle (see below). The parallel line refers to "his meeting" *(mō‹ădô),* which has regularly been taken to mean "his tent of meeting" *(›ōhel mō‹ădô),* as the context, the parallel with the "pavilion," and the use of *mô‹ēd* in the sense of "holiday" in the following line all indicate. The context also indicates that the references to the tent are not to be taken as figurative here, for the other items in this poetic reckoning of things that are lost with the Temple are all actual objects, institutions, and persons: altar, walls, holiday, sabbath, king, priest. The books that recount the postexilic period do not refer to the Tabernacle or indicate any attempt to replace it actually or symbolically in the Second Temple. Like the ark, it ceases to play any part in the religious life of the community.

The Hebrew Bible thus presents a picture of the Tabernacle's place in history from its construction in the wilderness to its erection at Shiloh and then at Gibeon to its placement inside the First Temple until its destruction in the burning of the Temple ca. 587 B.C.

B. Historicity

1. Archeology and the Biblical Sources. A central component of the Graf-Wellhausen model of the history of ancient Israel was the view that the Tabernacle never really existed, that it was a pious fraud conceived by the authors of the priestly (P) sections of the five books of Moses to represent the Second Temple. Evidence collected by scholars since the beginning of the 20th century, however, has undermined the view that the Tabernacle was a fiction. Parallel institutions of tent shrines in the Semitic world from ancient Phoenician to modern Islamic examples have been described (see Cross 1961: 217–19, and references; *CMHE,* 72). Most notable among the parallels probably is the pre-Islamic *qubbah,* a small, portable red-leather tent. The biblical tent of meeting, too, is protected by a red-leather covering (Exod 26:14). It has been claimed that the Tabernacle as described in the Torah is too massive to be portable as required. Admittedly, the Tabernacle is set on silver bases that would be quite heavy, but historically the bases may have been permanent mounts that were added precisely when the Tabernacle ceased to be portable. The Pentateuchal text, in that case, would subsequently have included them because, by the time of the composition of this text, they would have been in place for a long time. The actual mass of the Tabernacle itself, meanwhile, is unknowable since it is made of wooden frames, and only the frames' length and width are given in the biblical text, but not their thickness. The thickness has occasionally been assumed to be one cubit (18 inches), which would indeed produce a massively heavy structure, but this is

a groundless assumption in the absence of any report in the text. Indeed, this view assumes a frame that is many times the thickness of the siding of a house. The frames were formerly assumed to be solid boards, but the language of the text itself and especially the use of the term *qerasîm* for these boards (with parallels in the dwelling of El in an Ugaritic text) suggest rather that they were formed like a trellis (Cross 1961: 220).

Furthermore, the elaborate details of the fabrics, wood, and precious metals of the Tabernacle do not have the appearance of sheer fiction. Embedded in the priestly (P) Pentateuchal narrative, the description of the Tabernacle's materials looks like the other documents that are embedded in the P narrative, for example the book of generations *(tôlĕdōt)* that is now cut and distributed through Genesis, the list of stations of Israel's journey (Numbers 33), and the Israelite census list (Numbers 1–2). These lists appear to be older documents that were used to add detailed facts to the narrative, and the Tabernacle text is of the same character. There is no need or justification for going into these details of fabrics, rings, rods, poles, embroidery, and silver bases in a work of pure fiction; and indeed there is no comparably detailed description of anything in the priestly work (cf., for example, the description of Noah's ark in Gen 6:14–16).

Cross (1961) and Haran (1965) have sought to identify the referent of the priestly description of the Tabernacle. Cross has argued that it is the tent that David erected. The description of that tent has now been made part of the priestly work and called the Tabernacle of Moses. Haran has argued that it is the Tabernacle of Shiloh, which the priestly writers believed to have been carried there from Sinai. Haran takes the elaborate detail and precious components of the description to be priestly embellishments in picturing the ancient tent structure. If we regard these details as unlikely to be fictional, as suggested above, then Cross' view is more likely. If we doubt that the details have any veracity, then either view seems possible (see below).

Two textual considerations figure in this matter of historicity. The first concerns the passages that picture the place of worship at Shiloh as a tent. The structure is called a house *(byt)* in Judg 18:31; 1 Sam 1:24 and a temple *(hykl)* in 1 Sam 1:9; 3:3. It is called the tent of meeting in 1 Sam 2:22b, but this half verse has been regarded with suspicion because (1) its language is so similar to the priestly (P) passage Exod 38:8, yet it is embedded in a context that otherwise is not priestly, and (2) it does not appear in the Greek or 4QSam [a]. Still, the half verse may possibly be native to its text and not a "gloss"; and, in any case, Ps 78:60 agrees with its identification of the Shiloh structure as a tent: "And he forsook the Tabernacle of Shiloh,/ The tent that he placed among humans." A. R. S. Kennedy (*HDB* 4: 654) dismissed this explicit reference to the Shiloh Tabernacle in the Psalm as "of too uncertain a date to be placed against the testimony of the earlier historian"; but Eissfeldt, Albright, and Cross have dated the Psalm as certainly preexilic and possibly as early as the united monarchy (*CMHE* 73n., 134, 242–43). That is, it is no less reliable than the prose source in the book of Samuel that refers to the structure as a house or temple. The Psalm, the reference in 1 Sam 2:22, and the P source in Josh 18:1; 19:51 all speak of a tent at Shiloh. The question is how to adjudicate between these passages and those that speak of the Shiloh sanctuary as a building (see below).

The second textual consideration concerns the depiction of the Tabernacle in the book of Chronicles as located in the Temple of Solomon. This depiction has been doubted on the grounds that (1) Chronicles is a late source and (2) Chronicles simply follows the P conception of the Tabernacle. The claim that the Chronicler is simply following P on this point is questionable. The law according to P declares repeatedly that sacrifice and various other practices can be performed nowhere on earth but at the Tabernacle (see citations above) and that this is the law forever. Since the Chronicler wrote in the period of the Second Temple, which did not contain the Tabernacle, the Chronicler would hardly be expected to go out of his way to develop this P perspective. Moreover, there is evidence that the references to the Tabernacle in the books of Chronicles were not the Chronicler's insertions but rather were part of the Chronicler's preexilic source. Halpern (1981) has assembled evidence that the Chronicler made use of a source text that recounted the history of the Judean monarchy down to the time of Hezekiah. A substantial number of terms, phrases, and concerns in the Chronicler's history run consistently through the accounts of the kings

of Judah down to the reign of Hezekiah, and they cease thereafter. In addition to the many items that Halpern lists, we must add the matter of the Tabernacle, which, as we have seen, is treated frequently and with importance down to the time of Hezekiah and then is not mentioned thereafter.

In sum, there is reason to believe that the Tabernacle was historical, and the biblical depiction of it as located in the Solomonic Temple cannot simply be dismissed as late and tendentious.

2. Architecture. The architecture of the Tabernacle is both interesting in itself and significant for the light it sheds on the history of the Tabernacle. The architecture has presented a classic problem in amateur and professional biblical scholarship for centuries. The biblical account of the command to build the Tabernacle includes descriptions of the components of the structure but no directions as to how to put them together. The assembly of the tent must therefore be derived from the character and dimensions of the components.

The Tabernacle is a series of enclosures, with diminishing sanctity as one progresses from its interior through the various layers to the outside:

a. The *pārōket.* Inside is a small pavilion that contains the ark. This pavilion is composed of four columns with a fabric canopy spread over them. The pavilion is called the *pārōket.* It has generally been taken to be a veil hanging vertically in front of the ark, but the text says quite explicitly that one is to cover over the ark with it. The divine instruction to Moses at the time of the erection of the Tabernacle is, "And you shall make the *pārōket* cover over the ark" (*wesakkōtā ʿal hāʿārōn*; Exod 40:3). It is called the *pārōket hammāsāk* (40:21; Num 4:5). There is a reference to the *sukkâ* in the passage from Lamentations quoted above and in a passage picturing the deity's tent in Ps 27:5. The LXX uses the term *katapetasma,* meaning something that one stretches, a covering; its verbal form means to spread over, to cover with fabric. The term *pārōket* came to mean a veil by the rabbinic period, and so apparently the Tabernacle *pārōket* was assumed from that time to the present to have been a veil hanging as a partition in the interior of the Tabernacle. This assumption already led to some confusion in rabbinic times. A Talmudic passage (*b. Sukk.* 76) dealing with Exod 40:3 states: "And you shall make the *pārōket* cover over the ark." The *pārōket* was a partition, yet the Scriptures call it a covering *(skkh).* Consequently, a partition is meant in the sense of a covering. And the rabbis (explain it thus): It means that it is bent a little (at the top) so that it looks like a covering." (See also *b. Soṭa* 37a; *b. Menah.* 62a, 98a; since the verse in Exodus explicitly says to make the *pārōket* "cover *over*" [Heb *ʿal*] the ark, the *Gemara* concludes that in this case the word *ʿal* means "near to.") This confusion and these strained explanations of words that made no sense with reference to a veil underscore the difficulty of this view of the *pārōket.* It is rather a *sukkâ* that is pictured in Exodus as the innermost enclosure. This inner pavilion is made of the finest fabric: linen embroidered with cherubs, with blue, purple, and scarlet; and the columns over which this fabric is spread are made of acacia *(šittîm)* wood (Exod 26:31–32). See also VEIL; SCREEN.

b. The *miškan.* The *pārōket* is set up inside a second enclosure, called the Tabernacle, Heb *miškān.* (The biblical narrative uses the term *miškān* both for this second enclosure and for the entire Tabernacle.) The structure of this *miškān* in particular must be deduced from the information given about its components. The *miškān* is a great cloth composed of sheets of material (*yĕrîʿôt,* generally translated as "curtains"). The curtains that make up the *miškān* are made of the same fabric with the same embroidery as the *pārōket.* The *miškān* is constructed by arranging wooden frames *(qĕrāšîm)* as a rectangular box and then spreading the curtains over them.

(1) The Frames. The frames are made of acacia wood. Each frame is a trellis, with two vertical "arms," joined to one another (Exod 26:17). See Fig. TAB.01 (a). See also TENONS. There are 48 frames: 20 for each of the 2 sides of the *miškān,* 6 for the rear wall, plus 2 that are somehow arranged at the rear presumably for support at the corners. The frames are 10 cubits tall and 1.5 cubits wide. Metal rings are attached to the frames, and long rods (five on each side) are slid through the rings to hold the framework together. See also RING. The text does not say whether the frames are to be set up flush alongside one another (Fig. TAB.01 (b)) or whether they are to overlap one another (Fig. TAB.01 (c)).

The most common view in scholarly depictions of the *miškān* has been to assume that the frames stand flush against one another. Since the frames are 1.5 cubits wide, the framework has thus been understood

to be 30 cubits long by 10 cubits wide. In favor of this reckoning it has been observed that the Temple of Solomon is reported in 1 Kings 6 to have been 60 cubits long by 20 cubits wide: the Tabernacle is thus seen as a 1:2 scale model of the Temple. A problem with this comparison is that the six frames of 1.5 cubits width each in the back of the Tabernacle add up to only 9 cubits, not 10. The two special corner frames may make up the difference, or perhaps it is made up by the thickness of the side frames. The fact remains, though, that the 10-cubit width was not determined by what the dimensions in the text require; it was simply a guess that was proposed precisely to make the Tabernacle dimensions analogous to those of the Temple. The 1:2 analogy of the Tabernacle to the Temple is questionable in any case because the Temple's height is 30 cubits while that of the Tabernacle is only 10 (1:3).

A second question with regard to this flush arrangement concerns the 1.5 cubit width of the frames. Why the unusual size rather than a 1.0- or 2.0-cubit width? In the case of the overlapping arrangement of the frames the extra half cubit would be for the overlap. In that case, the 20 frames of each of the *miškān's* sides would mean a wall of 20 cubits. The rear wall, of 6 frames, would be 6–8 cubits wide depending on the arrangement of the corner frames and the thickness of the frames. The description of the rings and rods that connect the frames seems to fit better with this overlapping arrangement; the middle rod is said to reach from one end of the wall to the other "in the midst of" (Heb *btwk*) the frames.

(2) The Fabric. The measurements of the cloth *miskan* that is to be spread over the frames are given, and this information further helps to choose between these alternative arrangements of the frames. The *miškān* is composed of ten curtains, each of which is 4 × 28 cubits. Five of the curtains are sewn together into one large piece that is 20 × 28 cubits, as are the other five, resulting in two larger pieces of fabric, each 20 × 28 cubits. Loops are then sewn into the 28-cubit side of each, and the two larger pieces of fabric are then connected to each other by putting gold rings through the loops, yielding a double cloth that, if stretched flat, would measure 40 × 28 cubits. See Fig. TAB.02 (a). See also LOOPS; TWINED LINEN. This double cloth is then spread over the standing frames. On the view that the frames are standing flush, forming a rectangular box that is 30 cubits long, 10 cubits wide, and 10 cubits high, the double cloth would be spread full length from the opening. The cloth is 40 cubits long altogether, and so it covers the 30-cubit length of the frames, and its remaining 10 cubits fall as a flap to cover the back frames. The length of the cloth thus matches the structure satisfactorily; the width of 28 cubits, however, does not match. The frames are 10 cubits high on each side, and it is another 10 cubits across the top. That requires that the *miškān* be 30 cubits wide altogether; but, since it is only 28 the cloth is a full cubit above the base on each side. Those who hold this view of the Tabernacle suggest that the shortfall may be to protect the precious cloth from touching the ground; but if this were the case the rear flap of the cloth should be one cubit shorter as well, but it goes all the way to the base. Also, a gap of an entire cubit (about 18 inches) between the end of the fabric and the base seems excessive and awkward looking in any case.

Another problem with this view of the design is that it leaves precious gold rings virtually invisible, for in this view the frames stand between the rings and the interior of the Tabernacle so that one who is inside cannot see them. They cannot be seen from the outside either because the entire structure is wrapped in a red-leather cover. That leaves them unseen. In this view, their purpose is to divide the Tabernacle into two parts, the "holy place" and the "holiest place" (or "holy of holies"). The text says that the *pārōket* is to be hung "under the rings" (Exod 26:33), and so in this view the *pārōket* is pictured as a veil hanging directly below the rings. This is attractive to the extent that it makes the "holy of holies" a perfect cube, 10 cubits long, wide, and high. (The "holy of holies" in Solomon's Temple is a 20-cubit cube.) As we have seen, however, the *pārōket* is more probably a canopy, not a veil; and so it does not make sense to speak of it as standing under a single line of rings.

In the case of the overlapping arrangement of the frames, the two pieces of fabric that make up the *miškān* would not be laid side by side but rather on top of one another as a double layer of the fabric. The rings would thus all be at one end. The measurements of this cloth would be 20 × 28 cubits. The frames would be 20 cubits long, 6–8 cubits wide, and 10 cubits high. The cloth of the *miškān* would fit this perfectly. Its 20-cubit width would match the 20-cubit length of the framework. Its 28-cubit length would

go up the 10-cubit high side, across an 8-cubit width, and down the other 10-cubit high side. The rings would form a pattern of gold around the entrance. See Fig. TAB.02 (b).

The question may be raised against this view that the instruction that the *pārōket* be placed "under the rings" makes little sense if the rings are encircling the entrance. The problem, however, appears to be a textual one. The LXX of this verse does not say "under the rings" but rather "under the frames." The Heb term for "frames," as mentioned above, is *qĕrāšîm*. The Heb term for "rings" is *qĕrāsîm*. The Greek translator is reading the former, while the MT gives the latter. In the light of the clumsiness of the MT text for either of the two views of the *miškān,* and the obvious vulnerability of these two terms to scribal confusion, the LXX is preferable. The command to place the *pārōket* "under the frames" would then mean that the *pārōket* must be lower than the height of the frames.

c. The *ʾōhel.* The *miškān* is covered by a third enclosure, called the "tent" (Heb *ʾōhel*). It is made of a less-valuable fabric, goat wool, and it is not dyed or embroidered. Like the *miškān,* it is made of two pieces of fabric joined together by loops and rings, but its rings are of brass instead of gold. Its measurements shed further light on the construction of the Tabernacle. Instead of having a 28-cubit width, it has 30. In the flush arrangement of the frames, this leaves a cubit of this less-attractive fabric showing on each side (but not on the back) of the structure, which, again, seems questionable. In the overlapping arrangement of the frames, however, the extra cubit would be spread back along the edges of the *miškān* on both sides to cover it and thus protect the finer fabric from touching the ground. This is stated explicitly in Exod 26:13: "And the cubit on one side and the cubit on the other side, of the extra in the length of the curtains of the *ʾōhel,* shall be spread on the sides of the *miškān* on the one side and on the other side to cover it." This favors the overlapping arrangement of the frames. It is difficult to reconcile it with the flush arrangement. There is one more aspect of the *ʾohel* that further confirms the overlapping arrangement of the frames. Instead of being made of two groups of five curtains like the *miškān,* the *ʾōhel* rather has one group of five and one of six curtains. The sixth curtain, which like the others is 4 cubits wide and 30 cubits long, falls along the rear wall of the frames. When folded double, each half of it is spread back to cover 4 cubits of the rear wall. See Fig. TAB.02 (c). This, too, matches and confirms the 8-cubit width of the overlapping arrangement of the frames. It does not fit the 10-cubit width of the flush arrangement. Those who have held this view of the Tabernacle, i.e. the flush arrangement, have understood the sixth curtain to be folded back around the entrance of the structure, i.e. as a flap folded back along the roof and sides of the front, rather than on the rear wall. The text says, "And you shall double the sixth curtain opposite the front of the tent (*ʾel mûl pĕnê hāʾōhel*)" (Exod 26:9b). The words "opposite the front" do not easily fit with this understanding. The location that is "opposite the front" is the rear; and the verse that refers to the spreading back of the half curtain (v 12) says explicitly, "The half of the extra curtain shall be spread on the rear of the *miškān."* Again, it is the overlapping arrangement that conforms to the description of the materials in Exodus 26.

d. The Outer Enclosures. The *ʾōhel* is covered by two more enclosures: the covering of ram leather dyed red and a covering of *tĕḥāšîm* skins. The meaning of *tĕḥāšîm* is uncertain. It has been translated as "badger" or "dolphin" among other things. It has been connected to an Assyrian word meaning "sheepskin" and an Egyptian word meaning "to stretch or treat leather" see Cross 1961: 220.) The entire structure with all its layers is then surrounded by one more enclosure, a great open court.

3. The Tabernacle and the Temple. The matter of the dimensions of the Tabernacle has implications for the recovery of its history. The view of the flush arrangement of the frames resulted in a Tabernacle that was analogous to the dimensions of the Temple of Solomon. This has been judged here to be questionable since only one of the three Tabernacle measurements (the length) can be ascertained to be one half the size of the corresponding Temple measurement; the height is one third, and the width is uncertain. This raises questions concerning the view in the Graf-Wellhausen hypothesis that the Tabernacle was merely a literary fiction, conceived to stand for the Temple. The evidence that the Tabernacle was historical in any case, discussed above, coalesces with this matter of the dimensions to place serious doubt on this point.

In the view of the overlapping arrangement of the frames, the Tabernacle is 10 cubits high, 20 cubits long, and 8 cubits wide. The 8-cubit width, it should be noted, is the size of its *exterior* dimensions. Since the frames themselves have some thickness, the interior of the Tabernacle would be somewhat smaller, but not less than 6 cubits wide since there are 6 frames in the rear. These dimensions correspond to the dimensions of structures known to us from the Hebrew Bible and from archeology. In the Hebrew Bible, these dimensions correspond to the size of the space under the wings of the cherubs in the holy of holies in the Temple of Solomon. The Holy of Holies is a perfect cube, 20 cubits on each side (1 Kgs 6:20; 2 Chr 3:8). Inside stand the two cherubim, carved of olive wood and plated with gold. These two statues are each 10 cubits tall. Unlike the usual cherubs known to us from the ANE, which have their wings folded back against their bodies, the Temple cherubs have their wings spread wide, touching the wall on either side and touching each other in the center. The space under their outspread wings is 20 cubits deep, 10 cubits high, and less than 10 cubits wide (because their bodies take up some of the center space).

The discovery of a temple at Arad by Y. Aharoni led to further confirmation of these measurements. The Arad temple was found to have features strikingly in common with the Tabernacle (Aharoni 1973). The height of the Arad temple is unknown, but its length is 20 cubits, and its width is 6 cubits. As discussed above, the Tabernacle and the space under the wings of the cherubs both match this 20-cubit length. The width of the Tabernacle is calculated here to be 8 cubits wide at the exterior and at least 6 cubits wide in the interior, which also matches the Arad sanctuary's width and fits within the less-than-ten-cubits limit of the place under the cherubs' wings.

The correspondence of the dimensions of the Tabernacle to the dimensions of the space under the wings of the cherubs in the Temple sheds light on the question of the historicity of the biblical report. The Tabernacle may have actually stood under the wings of the cherubs in the Solomonic Temple, or it may have been stored inside the Temple while the corresponding space under the cherubs' wings symbolized and reflected its presence. The Babylonian Talmud in fact reports that the tent of meeting was stored away beneath the crypts of the Temple of Solomon (*b. Soṭa* 9a). Josephus reports that the Tabernacle was brought to the Temple as well (*Ant* 8.101; see also 106), and he comments that the outspread wings of the cherubs had the effect of looking like a tent (8.103). A number of Psalms (26:8; 27:4) present this same picture of the Tabernacle in the Temple. Remarkably, Ps 61:5, says:

> I shall abide in your tent forever,
> I shall trust in the covert of your wings.

The parallel here of the deity's tent and the hidden place of the deity's wings is notable in the light of the evidence associating the tent of meeting with the wings of the cherubim. It has long been recognized that the referent of the wings in this Psalm is the winged cherubs (Rabe 1963: 35; Dahood, *Psalms I* AB, 107–8; Briggs, *Psalms* ICC, 64; Kraus, *Psalms I* BKAT, 433; Weiser, *Psalms* ATD, 302). The report of the destruction of the Tabernacle along with the Temple in Ps 74:7 belongs with this group of Psalmic references to the Tabernacle in the Temple as well (see also Pss 27:6; 76:2–3; and more general references in Psalms 15; 43; 46; 84).

The report in 1 Kgs 8:4 (= 2 Chr 5:5) that the Tabernacle was brought to the Temple at the time of the Temple dedication thus cannot simply be dismissed as a "gloss"; nor can the references to the Tabernacle's presence in the Temple in the books of Chronicles, Psalms, and Lamentations be lightly discarded as late, idealizing, or figurative. Indeed the rejection of the report of the Tabernacle's arrival in 1 Kgs 8:4 was a product precisely of the Graf-Wellhausen rejection of the historicity of the Tabernacle. Wellhausen argued that "Some mention of the Tabernacle, had it existed, would have been inevitable when the Temple took its place" (*WPHI*, 43). But here in fact was the mention of the Tabernacle that Wellhausen insisted upon, and Wellhausen eschewed it, saying that it "has no connection with its context, and does not hang together with the premises which that furnishes …" and he concluded, "it is the interpolation of a later hand" (*WPHI*, 43–44). These claims are simply unfounded. The report of the transfer of the Tabernacle is perfectly consistent with its context, following as it does immediately upon the report of the transfer of the ark. It is true that the Tabernacle is not mentioned for quite some time prior to this point, but this particular source of the Deuteronomistic historian only begins a few chapters

earlier (1 Kings 3; the lengthy narrative preceding this is a different source, the Court History of David). The verse in Kings has also been suspected of not being native to this passage because it refers to "the priests *and* the Levites," according to the MT. This is atypical in Deuteronomistic terminology and more characteristic of priestly (P) terminology. These words do not appear in some of the OG texts, however; and the MT (but not OG) of the equivalent verse in Chronicles reads "the Levitical priests," which is in turn atypical in the Chronicler's terminology. The textual situation is therefore too unclear for this wording to be evidential on either side. In any case, whatever the stage at which the report of the transfer of the Tabernacle to the Temple came to be in the text, it is in agreement with the archeological evidence, the architectural evidence, and the reports in Chronicles, Psalms, Lamentations, Josephus, and the Talmud that the Tabernacle was housed inside the Temple of Solomon.

This may also explain the confusion, noted above, over the passages that refer to the sanctuary at Shiloh both as a house/temple and as a tent/tabernacle. The Shiloh sanctuary may have been, like the Jerusalem Temple, a building in which the Tabernacle was stored or erected. If so, then this arrangement would have been made because the Tabernacle already had some prehistory and special status prior to the construction of the building at Shiloh. The report of the Pentateuchal sources E and P that the Tabernacle was the portable sanctuary of the followers of Moses before entering the land must be taken seriously in this regard. At the same time it must be recognized that the Tabernacle as described in the priestly (P) portions of the Torah and discussed above is not likely to correspond to this original tent structure. It is possibly too heavy and certainly too elaborate and costly to have been produced in the Sinai wilderness. As noted above, Haran (1962; 1965) takes the priestly description as an elaboration upon the more modest actual Tabernacle that had been at Shiloh, while Cross (1961) takes the priestly description to reflect the tent that David erected at Jerusalem. On the argument that the elaborate details do not appear to be sheer fabrication, the tent of David is the likely referent of these details. Also historically, if the tent of Shiloh was lost with the destruction of the Shilonite temple, then the tent that was brought to the Temple at Jerusalem and housed there may have been the tent of David, thereafter referred to as the Tabernacle or tent of meeting, whose successor it was.

The association of the Tabernacle with the Temple, whether at Shiloh or Jerusalem, whether the tent of David or the older tent of meeting, had an important symbolic meaning as well. It merged the stability of an established nation in its land with an ancient heritage of a people newly freed from slavery who experience a period of incubation in closeness to God. The Tabernacle in the Temple was a link to a history that played a defining part in the formation of biblical Israel's character.

C. The Tabernacle and the Sources

The Tabernacle is not mentioned in the Pentateuchal sources J and D. Its role is significant in E, but it is mentioned only a few times. There is no indication there of its size or materials. Its importance derives from the fact that it is the place where the deity communicates with Moses. It is pictured sufficiently simply and so connected to Moses personally that some have argued that it is Moses' own tent, though there is no textual support for this claim. There are contradictions of fact between the E picture of the tent of meeting and that of P. In E the tent is moved outside of the camp following the golden calf incident (Exod 33:7–11), and it remains outside the camp, as indicated by the wording of the episode of Miriam's leprosy (Num 12:4). The E report of the tent's being moved, however, comes before the report of the Tabernacle's being made and erected in P (Exodus 40), resulting in this contradiction, as noted above. According to E, further, Joshua stays inside the tent. This is in contradiction to the view of P, according to which no one who is not a priest is permitted inside the tent of meeting.

Most importantly, though, in P the Tabernacle is the center of religious worship, the only locus of sacrifice. It is thus inextricably bound to the crucial priestly law of centralization of worship (Leviticus 17). One cannot sacrifice anywhere but at the entrance to the tent of meeting. This in turn has important implications for the date of the source P. If the Tabernacle was historically located in the Temple of Solomon until its destruction in 587 B.C., as the evidence discussed here indicates, then the priestly narrative and much of the priestly law must have been composed in the period prior to the destruction. Otherwise one must assume that in the years following the destruction of the Tabernacle a priestly author

wrote the law requiring that one sacrifice nowhere but at the Tabernacle that no longer existed. Other recent evidence coalesces with this matter of the Tabernacle's historical place to support a preexilic date for P. See also TORAH.

Centralization of religious worship at the Tabernacle also played a critical role in the development of the priesthood in Israel. It meant the concentration of legitimacy, authority, and income in the priestly establishment at the central sanctuary. At Shiloh this meant the priesthood that is associated with Eli and Samuel. The background of this priesthood is debated and has been identified in recent scholarship as being Levitical, non-Aaronid, and possibly Mushite (*CMHE,* 195–215; Friedman 1987: 40–42, 72–79, 117–49). At Jerusalem, apparently from the beginning of the establishment of the Temple, the Aaronid priesthood was in authority. With the policy of centralization, which begins with the reign of Hezekiah according to the report of the books of Kings and Chronicles, the command to sacrifice only at "the entrance of the tent of meeting" comes to be manifestly in the service of the Aaronid priesthood. This, too, belongs among the evidence that P was composed in the preexilic period and quite possibly in the reign of Hezekiah.

The place of the Tabernacle in centralization also means that the Tabernacle plays a substantive role in the priestly conception of monotheism and thus in the biblical presentation of monotheism overall. Though monotheism need not require that there be only one legitimate place of sacrificial worship, such centralization does seem to be particularly compatible with and serviceable to monotheism: one God, one altar, one central shrine.

RICHARD ELLIOTT FRIEDMAN

TABERNACLES, FESTIVAL OF. See BOOTHS, FEAST OF.

TABGHA (M.R. 200251). A solitary area with no settlements from NT times, on the NW shore of the Sea of Galilee at the foot of the Mt. of Beatitudes and S of the ancient highway from Tiberias to Capernaum. From Roman times onwards, the spring water was used for irrigation and water mills. In Christian tradition, three events are commemorated in this area: the Sermon on the Mount (Matt 5:1–11), the miracle of the multiplication of the loaves and fishes (Matt 14:15–21; Mark 6:35–44), and Christ's apparition to his disciples, his preparing a breakfast for them, and the conferring of the primacy on Peter (John 21). Byzantine writers add other events. Theodosius (ca. A.D. 530) speaks of the baptism of the Apostles; the Anonymous *"Life of Constantine"* (written during the period of A.D. 715–1009) mentions the *"Dodecathronon,"* the "place of the twelve seats" where Christ taught. St. Jerome (A.D. 404) refers to the site mistakenly as a desert, thus taking Mark 6:31 *erēmos topos* (Lat *desertus locus*) literally and not in the intended sense of a remote spot. The primary source is a section preserved in Peter the Deacon's *"Book on the Holy Places,"* a 12th century monk and librarian at Monte Cassino, who attributed his information to Egeria, thus referring to the late 4th century. The author describes a pilgrimage center, a church with an altar above the place where the miracle of the five loaves and two fishes was performed and from where pilgrims took away small pieces of the rock. During the visit by Bishop Arculf (ca. A.D. 670–80) the church lay in ruins, while the approximately contemporary source of Epiphanius the Monk

speaks of a village with a large church. (On the various sources consult Loffreda 1970a: 21–36; Wilkinson 1971: 196–200; 1977: 81, 108, 120, 169–70, 203).

Six of the seven springs, an earlier chapel beneath the main pilgrimage church to the S of the highway, the Sanctuary of the Sermon on the Mount on the N side of the route, and a chapel close to a small anchorage on the shore of the Sea of Galilee, as well as Arabic and Crusader remains, have been located and brought to light at Tabgha. (See the maps in Loffreda 1970a: 2; and Wilkinson 1971: 195.)

The lakeshore chapel with four steps leading up to it from the S is traditionally connected with the spot where Jesus stood, when he received his disciples and prepared a meal for them (John 21:4, 8–9); Loffreda (1970a: 104–5) calls it the Sanctuary of the Primacy. In this building, a rock-hewn table on the E was the focal point, and, being the only one among the excavated structures to have been in use until A.D. 1263, the medieval sources referring to a "table" *(Mensa Domini)* must relate to it. These sources include the *"Commemoratirium de casis Dei,"* a list of churches and monasteries from A.D. 808, mentioning at the same time the monastery of Heptapegon with ten monks; the report *"De situ Urbis Ierusalem"* from A.D. 1130; Thetmarus' account of A.D. 1217; and a Florentine map of the 13th century, where the site is named Tabula (for an illustration see Loffreda 1970a: 26).

The pilgrimage church was excavated by A. E. Mader and A. M. Schneider in 1932 on behalf of the Görresgesellschaft. The earliest sanctuary was discovered by B. Gauer in 1936 during restoration work on the mosaics and it was subsequently excavated by Schneider. In the same year, a basilica was erected over the ancient remains and a new one was consecrated. In 1970, when the mosaics of the N transept had to be repaired, the missing walls of the earliest sanctuary could be traced by S. Loffreda. In 1976, 1979, and 1980 soundings were made by the author in the *bema* area and the N section of the atrium. B. Bagatti unearthed the Sanctuary of the Sermon on the Mount in 1935, and S. Loffreda excavated the Sanctuary of the Primacy and systematically explored the ancient remains on the Franciscan property at Tabgha in 1969.

The Church of the Multiplication of the Loaves and Fishes (56 m long and 24.30 m wide in the E and 33 m in the W), comprises a basilica with atrium and narthex as well as side rooms all round except for the E third of the diagonally set N wall, where the builders had to take into account the direction of the highway. The church (22.60 × 15–20 m) combines the basilical and cruciform floorplans and consists of two units: in the W, the church hall is divided by two rows of five columns into a nave (7.90 m wide) and two aisles (3.58 m wide); in the E, is the transept (20 × 11.30 m) and the sanctuary of a shallow apse (3.50 m deep) and two lateral rooms, an unusual feature and possibly of liturgical significance.

The 6 × 6.9 m presbytery *(bema)* was raised by one step above the floor of the transept and hall. Its focal point was the altar with its E end in line with the chord of the apse. The preserved base (1.70 × 0.95 m) contains four sockets for the legs of the altar slab and within these an unworked block of limestone, placed there intentionally and showing signs of chipping. The presbytery with its central entrance from the W underwent two phases. In an early phase, the chancel screen was T-shaped, covering most of the transept across the width of the nave and extending narrowly along the lateral rooms. In a later phase the chancel screen was removed in front of these rooms. This development does not conform with that of other churches of the region (cf. Gerasa in Kraeling 1938: 181–83).

The W division of the transept was achieved by a row of two columns in the middle and two columns on pedestals on both sides. The center, set in line with the presbytery opening, was marked by a triumphal entrance, which in a first phase consisted of a wide arch rising from the two innermost of the pedestal columns. In a later phase, following the destruction by an earthquake, a portal with three openings formed by the two central columns with architraves was built. Architectural fragments include bases, column drums and capitals of both marble and limestone, fragmentary small marble columns, slabs of the chancel screens, and the altar.

The atrium (ca. 23 × 13 m) has an open space with remains of a fountain *(cantharos)* in the center, three porticos on the S, N, and W, and lateral rooms which continue along the S of the basilica. The atrium and basilica are separated by a corridor *(narthex?)* which appears to have taken the place of the usual E portico.

The basilica and atrium were decorated with mosaic floors. Glass cubes of several colors, found in the apse area, indicate that there once was an apse mosaic. Nave, aisles, presbytery, the lateral rooms and the W corridor had floors in geometrical patterns, the one in the S aisle was completely destroyed, while the others have patches missing. Of the basically white, coarse atrium mosaic little was preserved.

The transept area which flanked the presbytery was embellished with intricate figure carpets of Nilotic landscapes with fauna and flora. There are representations of swan, geese, doves, ducks, herons, cranes, cormorants, and flamingos; lotus, papyrus, reeds, and oleanders. Though there is a definite lack of realism, the birds are shown in their natural activities like nesting, feeding, or hunting for food. The better preserved N carpet shows birds which are bigger than the plants and the three buildings: a tower, a pavilion, and a city gate. The damaged S carpet displays the same setting with a Nilometer.

These mosaics belong to the so-called figure carpets, which emerged during the 5th century A.D. in the E Mediterranean. Essentially representing landscapes filled with various iconographical subjects such as hunting scenes, animal pursuits, or paradise visions, there are two main groups: one with human figures and the other with animals, plants, and buildings (Kitzinger 1976; 1977: 50–52). The Tabgha floor has several characteristics. The two carpets lack an inner division and the subjects are all to be viewed from the front, i.e., the W. The birds are bigger than plants and buildings, and the composition is neither realistic nor naturalistic: one has waterfowl perching on branches and flowers which could not possibly have carried their weight, and the other has incorrect details of the plants and their never growing out of water marshes. Overlapping and shadowing have been avoided. The absence of movement implies tranquility and serenity, thus the theological concept expressed by the artist and the church commissioners could have been peace in nature as part of the savior paradigma (Nauerth 1987) as well as the equation of the Nile with the river of paradise Gihon-Geon in early Christian ideology and iconography (Herrmann 1959: 38–43).

The dating of the church remains problematic, since no dated inscriptions have come to light. The Nilotic landscape mosaics are dated on stylistic grounds to after A.D. 450 (Kitzinger 1976: 72); the subject has a close parallel on the silver trulla in the Hermitage Museum with four stamps from the time of the emperor Anastasius I, A.D. 491–518 (Herrmann 1959: 61–63; Effenberger 1978: 93–96). Soundings in the atrium revealed sealed material which points to a construction date in the second half of the 5th century (Rosenthal and Hershkovitz 1980: 207). Accepting that the architectural structures and the mosaic floors were constructed together, it follows that this church cannot have been seen by Egeria, who then could have visited the earlier, much smaller chapel with a single nave (Schneider 1937: 20–23), dated by Loffreda (1970b: 378–80) to the late 4th or early 5th century on the evidence of a coin minted under the emperor Honorius during A.D. 395 and 408. This evidence does not conform to the now accepted date of Egeria's visit to the E between A.D. 381 and 384 (Wilkinson 1971: 3, 237–39).

Finally, we have to consider the question whether the sacred rock on which bread and fish had been placed and from which pilgrims broke off fragments was venerated in this road church or in the lakeshore chapel (compare the different interpretations of Schneider 1934: 40–41 and Loffreda 1070a: 27–30, 99–105). To the E right behind the altar a fragmentary mosaic piece depicts a basket with two complete breads and two halves, flanked by a fish on either side, the *Tilapia Galileae*—St. Peter's fish. Together with a donor inscription (the last line with the date has unfortunately been damaged) on the N side of the altar, this mosaic belongs to a repair of the 6th century; it shows that until the church's destruction, probably already in the Sassanid invasion of A.D. 614, the miracle of the loaves and fishes was commemorated in this major pilgrimage church.

TABLE FELLOWSHIP. Ancient meal customs placed a higher premium on the symbolic value of table fellowship than is common in the modern Western world. To the ancients, sharing a meal was embued with ritual meaning and often signified the most solemn and intimate of social relationships. Such conventions were utilized in various social and religious associations and contributed to the development of early Christian communal meals.

2. Sharing Food
3. Exclusion and Inclusion
B. The Social Function of Communal Meals
C. Table Fellowship as a Literary Motif

———

A. Conventions of Table Fellowship Symbolism

1. Dining Together. The formal meal or banquet was the primary social event for the ancients and one which carried a great deal of meaning. Dining together created a tie or bond among the diners which in turn created an ethical obligation toward them. For example, in the ANE eating together was often utilized to symbolize the ratification of a covenant between two parties (Gen 26:26–31). In the Greek tradition, table etiquette was a part of ethical instruction and was especially based in the ethics of friendship. That is to say, rules of etiquette at the table were defined in terms of behavior that enhanced the enjoyment of the occasion for all present or contributed to the "friend-making character of the table" (Plut. *Quaest. conv.* 614A–B; see also Plato's "symposium laws," *Leg.* 2.671C–72A). The statutes of Greek clubs and associations express similar concerns, prohibiting individuals from speaking out of turn and engaging in other divisive behavior at their communal banquets (*IG* II^2 1368.107–10; *ILS* 7212.2.25–28; Roberts, Skeat, and Nock 1936: 41–42). In the extended section on meal ethics in Sirach (31:12–32:13) the ethical basis for table etiquette is: "Judge your neighbor's feelings by your own, and in every matter be thoughtful" (31:15). Similarly, in the NT, when Paul defines the rules of conversation or speaking at the Christian gatherings, gatherings which include meals (1 Cor 11:17, 20, 33) and whose theological definition is developed at least partially out of meal symbolism ("This is my body … all the members are one body" [1 Cor 11:24, 12:12]; Bornkamm 1969), he does so in terms of that which "edifies" the whole church rather than the individual (14:4–5, 26–33; Smith 1980 and 1981).

2. Sharing Food. The idea of social bonding at the meal was especially symbolized by the specific action of sharing food together. Such symbolism was then used in discussions of ethics at the table as in this example from Plutarch: "Indeed, just as the wine must be common to all, so too the conversation must be one in which all will share" (*Quaes. conv.* 614E). Paul draws on similar imagery in defining how the Christian communal meal, the Lord's Supper, creates bonds among the diners: "Because there is one

bread, we who are many are one body, for we all partake of the one bread" (1 Cor 10:17). This motif lends added poignancy to the scene where Jesus' betrayer shares from the same dish (Matt 26:23 = Mark 14:20 = John 13:26).

3. Exclusion and Inclusion. Meals as social institutions are characterized by the ways in which they define social boundaries in terms of who is excluded and who is included (Douglas 1972: 61; Goody 1982: 191). The same was true in the ancient world as expressed, for example, by the way in which the custom of reclining was practiced and understood. Reclining represented the posture of wealth and privilege; thus only a free citizen could recline at table, while women, children, and slaves, if present at the meal, must sit (Dentzer 1971: 240–55; Smith 1980: 33–38). During the Roman period, however, women began to recline along with men, but the original meaning of the custom was not forgotten (Philo *Vita Cont* 68; Lucian *Symp.* 13). This interpretation of reclining is also reflected in the Jewish Passover liturgy where it is specified that the poor are to recline at the meal along with everyone else, thus apparently symbolizing their full inclusion in the community on the occasion of the festival meal (*m. Pesaḥ* 10.1).

In Judaism, the food laws (kashruth) functioned as a means to define boundaries between the Jewish community and the rest of the world (Douglas 1972: 78–80). When Paul opposed this practice in the Christian church at Antioch, he did so precisely because it defined boundaries so effectively, boundaries which in this case worked against his vision of the social solidarity of the larger Christian community (Gal 2:11–21, 3:28).

B. The Social Function of Communal Meals

The effectiveness of a meal in symbolizing exclusion from outside society and inclusion in a special social group helps to explain its popularity as a social institution in the ancient world. Indeed, the banquet functioned as the primary way in which various social groups exemplified and solidified their group identity. Various kinds of clubs and associations are known to have existed in the Greek and Roman world, such as religious, funerary, and trade associations, but in virtually every case in which we are able to reconstruct their structure, we find that they most commonly met together for meals out of a common purse (Smith 1980: 101–77; Klauck 1982: 68–71).

Like the Greek and Roman clubs and associations, other distinct social groups in the Greco-Roman world met together at table. For example, various Jewish groups, most notably the Therapeutae, Essenes, and Pharisees, also shared communal meals together as a major component of their group identity (Philo *Vita Cont* 40–89; 1QSa 2.11–22; Neusner 1979: 67–96). Similarly, the descriptions that we have of the assemblies of early Christian groups tend to emphasize the communal meal as a central activity that helped to define their community identity (1 Cor 11:18–20, 33; Gal 2:12; Acts 2:46; 20:7; Pliny *Ep.* 10.96.7).

The symbolism of social bonding or "communion" was also extended to include the deity at certain kinds of religious meals (see MEAL CUSTOMS; Hauck *TDNT* 3:799–800). Paul expressed a similar idea when he spoke of the Lord's Supper as providing "communion" *(koinonia)* with the blood and body of Christ (1 Cor 10:16).

C. Table Fellowship as a Literary Motif

When meals were described in literature, they tended to follow the idealized literary model of the formal meal as represented especially by the symposium tradition. This literary tradition was made up of standard themes and motifs that were very influential both in the repetition of the symposium form and in other genres as well (Martin 1931). The classic *Symposia* are those of Plato and Xenophon, in which they idealize a banquet at which Socrates was present. Their models became especially influential in subsequent centuries so that later philosophers as well as satirists mimicked them (Plut. *Quaes. conv.;* Lucian *Symp.*). Indeed, the symposium genre was widely utilized in various types of Greco-Roman literature. In the Jewish tradition, for example, it is utilized in the *Letter of Aristeas* and even contributes to the literary form of the Passover liturgy (Stein 1957). In the NT, it is reflected in the Gospels, especially Luke (de Meeûs 1961; Delobel 1966; Steele 1984; Smith 1987), as well as in 1 Corinthians 11–14 (Smith 1980 and 1981).

Other related literary motifs connected with meal traditions are especially connected with the Jesus tradition and the idealization of Jesus at table. For example, Jesus' ministry is effectively symbolized by the theme: "He eats with tax collectors and sinners," a theme that draws on the symbolism of exclusion and inclusion to define the nature of the kingdom that Jesus preached (Matt 11:18–19 = Luke 7:33–35; Matt 9:10–13 = Mark 2:15–17 = Luke 5:29–32). This became a prominent motif in the parables (Matt 22:1–10 = Luke 14:15–24) as well as in various other table fellowship texts in the gospels (Smith 1987).

TABLET. See WRITING AND WRITING MATERIALS.

TABLETS OF THE LAW. The phrase designates the two stone tablets inscribed with a set of laws and given by God to Moses on Mt. Horeb/Sinai. References to the tablets are concentrated in the parallel texts of Exodus (24:12; 31:18; 32:15, 16, 19; 34:1, 28) and Deuteronomy (4:13; 5:22; 9:9, 10, 15, 17; 10:1, 2, 4, 5); they are mentioned elsewhere in the OT only in 1 Kgs 8:9. The Bible itself does not use the above phrase as such, employing rather the equivalent expressions "tablets of the covenant" (Deut 9:9, 15) and "tablets of the testimony" (Exod 31:18; 32:15). According to both Exodus (31:18; 32:16) and Deuteronomy (5:22; 9:15), the writing on the tablets was done by God himself; as such the tablets' content has an authority even greater than that accorded the human written word in the ANE. On the other hand, the biblical record is ambiguous as to just which body of laws stood on the tablets. In Exod 24:12 Yahweh tells Moses "… I will give you the tablets of stone with the law and the commandment which I have written for their instruction." Here, it seems the tablets are to bear the whole body of laws previously communicated to Moses in Exodus 20–23, i.e., the "ten words" or Decalogue of Exod 20:1–17 as well as the prescriptions of the "Book of the Covenant" in Exod 20:23–23:19 (20–33). Deut 5:22 (cf. 4:13; 9:10), on the contrary, clearly and emphatically limits the inscribed text to the "ten words" of Deut 5:6–21 (= Exod 20:1–17). Finally, Exod 34:27–28 suggests that the "ten words" set down on the tablets comprised rather the cultic laws recorded in Exod 34:11–26, the so-called Ritual Decalogue. The uncertainty on the point left by the biblical documentation likely reflects divergent traditions as to which body of Israelite laws could claim preeminent authority in virtue of its having been written by God himself.

In any event, according to the parallel accounts of Exod 32:19 and Deut 9:17, Moses smashed the original set of tablets upon seeing the golden calf the people had made during his absence on the mountain to receive the tablets. Against the background of ANE practice, his gesture, destructive of the covenant document, signifies the abrogation of the covenantal relationship between God and Israel. Subsequently, God initiates the making of a new set, thereby intimating his readiness to reactivate the disrupted relationship (Exod 34:1; Deut 10:1–2). This second set of tablets receives permanent shelter in a wooden "ark" which Moses, on Yahweh's orders, prepares for them. As a container of the "tablets of the covenant/testimony," this object is designated as "the ark of the covenant" (Deut 10:8), or alternatively, as "the ark of the testimony" (Exod 25:16) (1 Kgs 8:9 affirms that the tablets were the sole content of the

ark; contrast Heb 9:4 according to which it also contained a sample of the manna and the rod of Aaron). The ark with its tablets eventually was installed in the "holy of holies" of Solomon's Temple, 1 Kgs 8:6. The Bible does not record what finally happened to either the ark or the tablets. Presumably, they were carried off in one of the successive despoilations of the Temple—either that of 587 or an earlier one. See ARK OF THE COVENANT.

In Deut 31:9, 26 one finds a new feature not recorded in the parallel material of Exodus, i.e … "the book of the law" (= some form of our book of Deuteronomy) written by Moses is placed "beside" the ark bearing the tablets of the covenant. This notice signifies that the former—while clearly subordinate to the Decalogue recorded on the tablets since written by Moses rather than God himself—nevertheless belongs closely together with it as its authoritative interpretation and application.

CHRISTOPHER T. BEGG

TABOR (PLACE) [Heb *tābôr* (תָּבוֹר)]. A Levitical city in the territory of the tribe of Zebulun listed in 1 Chr 6:62 (—Eng 6:77) but missing in the parallel list of Josh 21:34–35. If the town is associated with Mount Tabor, then the latter presumably would also have been included in the tribal territory of Zebulun (*HGB*, 184–85). This, however, seems unlikely. See TABOR, MOUNT. Some scholars have suggested that this Levitical city is actually CHISLOTH-TABOR (*LBHG*, 271; Naʿaman 1986: 224). Recent studies show that the lists of the Levitical cities of the N tribes are not derived from an independent geographical source but rather presuppose the descriptions of the tribal territories in Joshua 13–19, thus their value as historical sources is undermined (Auld 1979; Naʿaman 1986: 203–36).

RAFAEL FRANKEL

TABOR, MOUNT (PLACE) [Heb *har tābôr* (הַר תָּבוֹר)]. A mountain of very unusual shape and striking appearance located in the NE corner of the valley of Jezreel (M.R. 187232). The most explicit references to this "mountain" (Heb *har*) are found in Judg 4:6, 12, and 14, but Jer 46:18 and Ps 89:13 (—Eng 89:12) also mention "Tabor" in connection with other lofty peaks. The reference to "Tabor" in Josh 19:22 is also presumably to this hill. However, the existence of a place in Judah named Alon-Tabor (RSV "oak of Tabor," 1 Sam 10:3) indicates that more than one place was called Tabor, and some scholars have suggested that the references to "Tabor" in Judg 8:18 and Hos 5:1 also may possibly refer to other places.

The summit of Mt. Tabor is a plateau, 1,000 × 400 m in area, sloping down steeply in all directions and connected to the hills to the NW by a low saddle. In the past its slopes were thickly forested. It overlooks the Jezreel valley and controls one of the most important crossroads of the region where the main N–S routes meet and cross the valley. It is a landmark that can be seen from great distances, and from its summit Mt. Carmel, Mt. Gilboa, and Mt. Hermon can all be seen, a feature reflected in Jer 46:18 and Ps 89:13. Recently a small Iron Age site has been discovered close to the summit of the mountain, also containing remains of later periods (Gal 1982: 17).

Two biblical references suggest that the mountain was a place of worship. The first, while not explicitly naming Tabor, refers to the mountain where Zebulun and Issachar "shall offer right sacrifices" (Deut 33:18–19). The second reference mentions "a net spread upon Tabor" and clearly suggests some sort of cult practices (Hos 5:1). Krauss (1966: 165–172) suggested that Psalm 68 was directly connected to the cult on Mt. Tabor. Also, the god Zeus Atabyrios was worshipped at Rhodes on a holy mountain named Atabyrion (or Atabyrios), as well as at other places such as Sicily and Crete. Eissfeldt (1934) suggested that this E Mediterranean cult was Phoenician, and that it derived from the cult of the Galilean Mt. Tabor.

Lewy (1950–51), however, suggested that both names—Tabor and Atabyrios—stem from the name "Tibira," an epithet of the god Tammuz that he suggested was derived from Akk *tibira*, "metal worker."

The territories of Zebulun, Issachar, and Naphtali meet at Mt. Tabor, and the name Tabor itself is preserved in the names of two towns, CHISLOTH-TABOR (or "Chesulloth") on the border between Zebulun and Issachar, and AZNOTH-TABOR on the border between Zebulun and Naphtali. Some scholars place Mt. Tabor within the territory of Zebulun (e.g., *HGN*, 184), primarily because Tabor is named as one of the Levitical cities of this tribe (1 Chr 6:62—Eng6:77). However, it has been shown that the lists of Levitical cities of the N tribes is not an authentic geographical list, and apparently derives largely from the description of the tribal territories in Joshua. The occurrence of Tabor in the list probably derived from CHISLOTH-TABOR, thus its appearance is not relevant to Mt. Tabor's tribal affiliation. Other scholars place the mountain itself within the territory of Issachar (Noth 1953: 119), but the phrase "touches on Tabor" (Josh 19:22) suggests that the mountain itself was not part of the territory of this tribe. Thus, Mt. Tabor was apparently not an integral part of any one of the tribal territories (see *GP*, II: map 3; and map 72 in *MBA*). This and the gathering of the tribes on the mountain in the battle of Deborah (Judg 4:6, 12, 14) makes it probable that the mountain was a shared cultic center for all the N tribes.

In the Second Temple Period Tabor was one of the mountains on which signal flares were lit to announce the new moon (*t. Roš. Haš.* 2[1]:1, p. 210). Antiochus III captured the mountain in 218 B.C.E. (Polybius, *The Histories* 70:6), and it was one of the places held by Alexander Jannaeus (*Ant* 13.15.4). Alexander the son of Aristobulus was defeated near Mt. Tabor by Gabinius in 55 B.C.E. (*JW* 1.18.7; *Ant* 14.6.3). Josephus himself fortified the mountain (*JW* 2.20.6; *Life* 37) and described its capture by Placidus in 67 C.E. (*JW* 4.1.8). According to Christian tradition it was on Mt. Tabor that the Transfiguration of Jesus took place, although the mountain is not named in the NT references (Matt 17:1–8 = Mark 9:2–8 = Luke 9:28–36). The tradition, however, is clearly attested by the 4th century C.E. (Conder and Kitchener 1881: 367).

RAFAEL FRANKEL

TABOR, OAK OF (PLACE) [Heb *ʾēlôn tābôr* (אֵלוֹן תָּבוֹר)]. A tree in the territory of Benjamin used by Samuel (1 Sam 10:3) to denote the location of Saul's second sign of kingship. The phrase "Oak of Tabor" is found only in one location in the Bible (1 Sam 10:3), yet attempts have been made to associate it with the oak mentioned in Gen 35:8 and the palm in Judg 4:5. Strong reasons do not exist, however, for such an association. A further suggestion has been made that the Oak of Tabor is located near Bethel, since the three men meeting Saul in 1 Sam 10:3 were traveling toward Bethel. This idea is also uncertain. With the lack of archeological evidence concerning the Oak of Tabor, and the vague description of it in the Bible, determination of an exact site is impossible.

As far as the interpretation of the *ʾēlôn*, the word can be understood as either "oak" or "terebinth." Tabor, mentioned in the context of 1 Sam 10:3, appears to be different from the Tabor mentioned elsewhere in the Bible. Again, the lack of detail in the narrative of 1 Samuel 10 produces an unclear picture of the Oak of Tabor. The only conclusive remark of this location is that it must have been a prominent contemporary landmark.

TOM F. WEI

TABRIMMON (PERSON) [Heb *ṭabrimmōn* (טַבְרִמֹּן)]. The son of Hezion and father of Ben-hadad I who was king of Damascus during the reigns of Baasha, king of Israel, and Asa, king of Judah (1 Kgs 15:18). Nothing is known of Tabrimmon, but he may have reigned as king of Damascus prior to Ben-

hadad I. His name means "Rimmon is good" (or bountiful), Rimmon being a god worshipped by the Syrians (cf. 2 Kgs 5:18). In Assyria this deity was called Rammanu (Thunderer), a title given to Hadad, the god of storm, rain, and thunder. The compound name, Hadad-rimmon of Zech 12:11, suggests that these gods are identical.

PAULINE A. VIVIANO

TACITUS (PERSON). Roman historian, born ca. 56 C.E., probably of a Gallic or N Italian family. He received his rhetorical education under Marcus Aper and Julius Secundus, the most distinguished orators of his time. In 77 C.E., Tacitus married the daughter of Agricola, the consul, shortly before the latter's departure for Britain.

Tacitus began his political career as quaestor in 81/2 C.E., and praetor in 88 C.E. during the reign of Domitian (*Agr.* 9.6; *Hist.* 1.1; and *Ann.* 11.11). He left Rome on an official commission in 90 C.E. and returned in 93 C.E. shortly after his father-in-law's death. In Rome, Tacitus witnessed the final years of Domitian's criminal atrocities (*Agr.* 1ff. 3.2, and 44ff. and *Hist.* 1.1). In 97 C.E., Tacitus was made *consul suffectus* under Nerva and as Rome's leading orator, gave the eulogy for Verginius Rufus. In 100 C.E. with his friend Pliny (the future governor of Bithynia), he prosecuted Marius Priscus for extortion (Pliny *Ep.* 2.12.2). He may have governed a military province and later served as proconsul of Asia in 112/13 C.E. If a sentence in *Ann.* 2.61 was written after 115 C.E., Tacitus may have survived to the accession of Hadrian in 117 C.E.

Concerning Tacitus' writings, the Dialogus, once considered his earliest work, was dedicated to a consul of 102 C.E. and was likely published then or shortly thereafter. On the basis of style, some scholars reject its Tacitean authorship. Dialogus is a nonhistorical work which discusses the decline of Roman oratory. In the Dialogus, two lawyers and two literary men discuss the claims of oratory against those of literature and why eloquence had declined since the days of Cicero. Most notable, great oratory had declined because it was dependent on the free life and institutions fostered under the Republic.

In 98 C.E., Tacitus published *De vita Iulii Agricolae,* describing the life of his father-in-law, particularly his achievements in Britain. The work is at the same time a *laudatio* of the dead man and an *apologia* for Agricola's passive toleration of the tyranny of Domitian. This work is similar to earlier Greek semi-biographical moral eulogies. Although historical and descriptive material about Britain is included in this monograph, a more thorough narrative of Roman activity in Britain can be found in his *Histories.*

In the same year, Tacitus published *De origine et situ Germanorum,* an ethnographic study of the tribes N of the Rhine and Danube. While its purpose is somewhat uncertain, the work contains recurrent moral contrasts between the "noble savage" and the decadence of Rome and warns about the threat of the Germanic tribes on the N frontier.

Tacitus also wrote two longer monographs which survey Roman imperial history from 14–96 C.E. The first of the two historical works is usually called the *Histories* and covers the period from the death of Nero (68 C.E.) to the assassination of Domitian (96 C.E.). The *Histories* probably consisted of 14 books (see Jerome *Comm. in Zach.* 3.14 and below on the *Annales*). Only books 1–4 and the first half of book 5 are extant, describing the turbulent years of civil war that begin the era (from 69–70 C.E.).

Tacitus' last and greatest work was the so-called *Annales,* recording the history of the Julio-Claudian emperors, from the death of Augustus (14 C.E.) to the death of Nero (68 C.E.). The *Annales* consists of sixteen books, which have also not survived in their entirety. Existing mss lack two years from the reign of Tiberius, the entire reign of Gaius (Caligula), half of the reign of Claudius, and the last two years of Nero's rule.

Although tainted by his strong anti-Imperial bias, the works of Tacitus are the earliest extant account of Roman history in the 1st century C.E. SUETONIUS, the Imperial biographer and Tacitus' contemporary, as a court secretary, amassed invaluable material but often without a critical discretion. Likewise, Dio Cassius, a later historian of this period, lived close to the court but was unable to grasp the affairs of the early empire. Supplemented by archaeological, numismatic, papyrological, and artistic evidence, Tacitus is by far the chief witness for this significant historical period.

Tacitus is also the most significant Roman historical source on the Jews in the 1st century C.E. In his *Histories,* Tacitus describes the early stages of the Roman siege of Jerusalem, the end of which unfortunately has not survived. In this context, Tacitus records traditions about the origin of the Jewish nation, the nature of their religion, and a description of their land and history until the outbreak of the Great Revolt (*Hist.* 5.1–13).

Among the versions of the origins of the Jews found in Tacitus, some are neutral, one is favorable, and one is derogatory. One version is derived from the etymological association of Iudaei with Mt. Ida on Crete. Tacitus writes that the Jews, according to some, were refugees from Crete, leaving the island when Jupiter expelled Saturn. Other versions, recorded by Tacitus, assert that the Jews came from an overspill of the Egyptian population, some maintaining that the Egyptian Jews had originated in Assyria (suspiciously similar to the biblical tradition), and others that they came first out of Ethiopia (certainly not the region of modern-day Ethiopia). Tacitus also reports that some assign a very distinguished origin to the Jews, associating them with the Solymi (from which was derived Jerusalem) celebrated in Homer.

Finally Tacitus records the version which reflects what he calls the majority opinion (identical with the Greco-Egyptian tradition about the Jews). The Jews, hated by the gods and disease-striken, were led by Moses through the wilderness with the help of wild asses, which directed them to water. Moses taught the people profane religious notions and established a sabbatical for idleness. Tacitus criticizes Jewish proselytism, misanthropy, separatism, and their refusal to worship the emperor. Because of Tacitus' fame, his account had a tremendous influence from the Renaissance onwards.

Other interesting points about Jewish history are scattered throughout both historical works (see esp. *Hist.* 2.81; *Ann.* 2.42, 85; and 12.54). There is some uncertainty about what sources Tacitus relied on for his information but suggestions include Apion, Pliny the elder, and Antonius Julianus, Mucianus for geography, and, though unlikely, Josephus for the siege.

Tacitus also referred to Christians in his account of the burning of Rome under Nero (*Ann.* 15.44). The passage was intended to illustrate the magnitude of Nero's crimes and not to provide an in-depth description of a religious "superstition" that otherwise is of no interest to Tacitus. He relates that the movement was named after a certain Christus, who was crucified under Pontius Pilate during the reign of Tiberius. Tacitus also states that Christianity had spread to Rome, where it was growing in popularity (compare Suet. *Claud.* 25). Nero made the Christians scapegoats for the burning of Rome and used the occasion to cruelly execute Roman Christians, not so much for the crime of incendiarism, however, as for their antisocial tendencies (compare Suet. *Ner.* 16). Tacitus' account became a springboard for a later Christian tradition which painted a fantastic picture of persecution under Nero. Tacitus' account reveals Roman attitudes toward Christians in the early 2d century C.E. and is of particular interest when compared with the near contemporary letters exchanged between Pliny the Younger and Trajan.

SCOTT T. CARROLL

TADMOR (PLACE) [Heb *tadmōr* (תַּדְמֹר)]. An oasis in the N part of the area controlled by the united kingdom of Israel, which was fortified by Solomon (1 Kgs 9:18; 2 Chr 8:4). The Ketib in the MT of 1 Kgs 9:18 reads Tamar (Heb *tāmār*); the Qere corrects it to Tadmor (Heb *tadmōr*). For a further discussion of this point, see below.

Tadmor (34°36´N; 38°15´E) was an important desert oasis on the route to Mesopotamia, located halfway between Mari and Damascus. It is mentioned in the Assyrian records of Tiglath-pileser I (1115–1100 B.C.E.) as "*tadmar ša mât amurri,*" "Tadmor of the Amurru country" (*ANET*, 275). Amurru, or Aram, was located in what is now modern-day Syria. During the reign of Solomon, Amurru was one of the areas dominated by vassal treaty, and it appears that Solomon fortified it as part of his control of the trade routes, and also as a defense against the encroachments of the Arameans of the kingdom of Damascus. Tadmor later became known as Palmyra to the Greeks; it was a large and important trading center until its destruction by the Roman emperor Aurelian in 273 C.E.

There is some debate concerning the correct reading of 1 Kgs 9:18. As mentioned above, the Ketib reads Tamar, a word meaning "palm," which suits an oasis as a descriptive term. Therefore, it is possible

that the *dalet* of Tadmor was lost by haplography, and that Tamar remained in the text because the error was not at first noticed. The Qere reads Tadmor, as does the LXX of Lucian. The question is, are Tamar and Tadmor identical sites, or are they separate cities, both fortified by Solomon? The identity of Tadmor in 2 Chr 8:4 as the N oasis on the trade route connecting Mesopotamia and Palestine is certain. The city is mentioned as part of Solomon's building program immediately after the recounting of his conquest of Hammath-zobah in Syria. Therefore the identification of Tadmor as the city mentioned in the Assyrian records, later known as Palmyra, is clear.

However, in 1 Kgs 9:18, the name Tamar/Tadmor occurs in a list of cities that begins in the N and ends in the S, with Tamar/Tadmor at the end. If Tamar/Tadmor is to be identified with the site in Syria, it is out of geographical order (being in the N). Therefore, some scholars suggest that the correct reading is Tamar, and identify Tamar with a site in the SE part of Judah, also mentioned in Gen 14:7, Ezek 47:19; 48:28. Tamar was a fortified town on the border of Israel and Edom which functioned as a supply depot for mines in the Arabah. The location of Tamar is uncertain; two locations, Qasr ej-Jeheiniyah (M.R. 173048; W of the Arabah), or el-Qeriya (S of the Dead Sea), have been suggested.

TAHAN (PERSON) [Heb *taḥan* (תַּחַן)]. TAHANITES. Tahan is a descendant of Ephraim (1 Chr 7:25) and therefore a descendant of Joshua, the hero of the conquest (v 26). Tahan is the son of Telah and father of Ladan. The Ephraimite list in 1 Chronicles 7 is a unit that is interrupted in v 21b and resumed in vv 25–27. Since the antecedent of "his son" before Rephah (v 25) is unclear, the relation of Tahan to the earlier listing is also uncertain. Braun (*1 Chronicles* WBC, 114) suggests there is a repetition of names in vv 20–21 and 25–27 and some variations in spelling. Hogg (1900–1: 149–50) argues that the names in vv 25–27 beginning with Rephah (and therefore including Tahan) are variations or misreadings of the three sons of Ephraim found in Num 26:35–36. This Numbers passage is the only other listing of the Ephraimite clan in the OT and it names three sons of Ephraim: Shuthelah, Becher, and Tahan.

TAHASH (PERSON) [Heb *taḥaš* (תַּחַשׁ)]. The third of four sons borne by Reumah, the concubine of Abraham's brother Nahor (Gen 22:24). While Westermann (1985: 368) insists that Tahash is a personal name here, it could rather reflect the name of a land known in Egyptian texts from Thutmosis III to Ramesses II as *tḫs* and in the Amarna letters as *taḫši* (Simons 1937: 220). Although the region may have been located just beyond the NE border of Palestine, it more probably was situated N of Damascus, if not even N of Kadesh on the Orontes River. The suggestion that the name of Tahash derives from a place gains some strength by the pairing of him with Maacah. The Aramean Maacah tribe can be geographically fixed to the S foot of Mount Hermon, NW of Bashan (Josh 13:11, 13; 2 Sam 10:6, 8). Heb *taḥaš* is often treated as the same as the Ar term *tuḫas* (cf. *duḫas*) for "dolphin," but this interpretation is not certain. (See Haran [1965: 204 n. 28] for several attempts at identification.)

EDWIN C. HOSTETTER

TAHATH (PERSON) [Heb *taḥat* (תַּחַת)]. **1.** A descendant of Kohath (1 Chr 6:9—Eng6:24), one of the three sons of Levi (Gen 46:11). Tahath is the son of Assir and the father of Uriel (1 Chr 6:8–9—Eng6:

23–24). Tahath also appears in 6:22—Eng6:37 in a listing of the descendants of Heman, the singer, a Kohathite. The Kohathites were the most important of the Levitical families because Kohath was the grandfather of Aaron, Moses, and Miriam (Exod 6:18–20). In the wilderness the Kohathites, along with the Gershonites and Merarites, were charged with the care and transportation of the tabernacle. Later, King David gathered 120 Kohathites, with Uriel as their leader, to bring the ark to Jerusalem (1 Chr 15:5–15). Heman was the leader of those "appointed over the service of song in the house of the Lord" (1 Chr 6:16–18—Eng6:31–33).

2. A descendant of Ephraim and son of Bered (1 Chr 7:20). The name appears twice in the listing of the sons of Ephraim, first as the son of Bered, and second as the son of Eleadah. This genealogy of Ephraim lists many other descendants including two Shuthelahs, Bered, Zabad and others (vv 20–27). The significance of this passage is to point towards Joshua (v 27), an Ephraimite, the hero of the conquest. Braun (*1 Chronicles* WBC, 114) speculates that this genealogy is a combination of two earlier lists due to the repetition of various names (Shuthelah, Tahath), similarity of others (Bered, v 20 and Zabad, v 21; Eleadah, v 20 and Ladan, v 26; Tahath, v 20 and Tahan, v 25) and length of the genealogy. Hogg (1900–1:147–49) argues that the 1 Chronicles 7 text is corrupt and suggests that Ephraim's descendants should be reduced to Shuthelah, Tahath (or equivalents), and Eleadah (or equivalents). Num 26:35–36 is the only other OT listing of the Ephraimite clan (except Genesis 46 in the LXX). Based on the Numbers passage, Ephraim had three sons: Shuthelah, Becher, and Tahan (Tahath). They are described as the heads of clans.

3. Son of Eleadah (1 Chr 7:20). See #2.

M. STEPHEN DAVIS

TAHATH (PLACE) [Heb *tāḥat* (תָּחַת)]. A camping site for the Israelites during their journey through the wilderness (Num 33:26–27). The location of Tahath is unknown. It is part of an original list of place names used by the Priestly writer, the majority of which cannot be identified. This list was possibly the itinerary of a pilgrim route to and from Sinai (Noth *Numbers* OTL). The name Tahath occurs elsewhere in the Hebrew Bible as a personal name (1 Chr 6:9, 22—Eng w 24, 37; 7:20)

SIDNIE ANN WHITE

TAHCHEMONITE [Heb *taḥkĕmōnî* (תַּחְכְּמֹנִי)]. Gentilic identification of Josheb-basshebeth, chief of "the Three," (2 Sam 23:8). In the parallel passage of 1 Chronicles (11:11; cf. 1 Chr 27:32), the text reads "Jashobeam, a Hachmonite, was chief of the three; …" The textual difficulties surrounding this name are extensively discussed by McCarter (*2 Samuel* AB, 489). These difficulties preclude any certainty about the personal name, the gentilic designation, and the group title. The most likely reading for the personal name is "Yeshbaal." See JOSHEB-BASSHEBETH. The gentilic designation is most likely "Hachmonite." See HACHMONI. However, neither Tahchemon nor Hachmon, the presumed clan or place names, are identified elsewhere. McCarter states that the MT *ṯḥkmny* is a corruption of *bn ḥkmny* (MT 1 Chr 11:11). This has support from the LXX^{L} reading: *huios thekemanei.* Context supports "the Three" as the group name, apparently, but not certainly, a special force among "the Thirty" (cf. 2 Sam 23:18–39), David's corps of military elite *(haggibbōrim).* See DAVID'S CHAMPIONS.

DAVID L. THOMPSON

TAHPANHES (PLACE) [Heb *taḥpanhēs* (תַּחְפַּנְהֵס)]. An Egyptian outpost in the E Delta of Egypt bordering Sinai, and one of several outposts along the route through Sinai into Palestine and N Arabia. The Hebrew consonantal spelling reflects the Egyptian *T€ -ḥ (t)- (n.t)-p€ -nḥsy* meaning "the Fortress of Penhase." The Heb *taḥpanhēs,* rendered in Gk as *Taphanais,* through popular etymology was associated

by the Greeks with *Daphnai*, as the location was later known (and late also as *Daphne* and *Daphno*), and is probably still reflected in the contemporary Arabic name of the site, Tell ed-Defenna/Dafna (Lambdin, *IDB* 4: 510).

Modern Tell ed-Defenna, the ancient Tahpanhes (30°52´N; 32°10´E), is situated about 8 km W of el-Qantara and about 24 km SW of Pelusium/Farmea/Tell el-Farama (Timm 1985: 551–55). Excavations by Petrie in 1887 produced some earlier Pharaonic objects, but the earliest substantial occupation of the site dates to Psammetichos I (ca. 663 B.C.), founder of the Saite dynasty, who located a garrison of Greek mercenaries there, who were employed in his war against the Ethiopians (Ball 1942: 8). Excavations uncovered Greek pottery, weaponry, and various other objects. Some artifacts were also dated to the reigns of Neco (609–593), Psammetichos II (593–588), and Apries (588–566). There is no clear evidence of occupation of this site by Persians, although Herodotus suggests it, and early excavations of the site yielded pottery of "Persian design" (Fontaine 1948). With the establishment of the colony of Naucratis at the end of the 7th or early 6th century B.C. on the Canopic branch of the Nile, the commercial importance of Daphne must have slowly dwindled (Fontaine 1948). Dwellings of the Ptolemaic period and Roman period tombs were also found, but no Byzantine period remains (Petrie 1886; Fontaine 1948; Ball 1942: 8). The site is dominated by the ruins of a large rectangular building known to the *fellāḥīn* of Petrie's day as *qasr bint el-yahūdīya*, "The Fortress of the Jewish Woman." The *qasr* appears to be a fortified residence of a governor of Daphne from the Saïte period, although the traditional association with the Jews is curious. Also, the famous statue of the god Baal-zaphon located in the Cairo Museum was taken from Tell ed-Defenna/Daphne although details of its discovery are vague.

Herodotus mentions Daphne, along with Elephantine and Marea, as one of three outposts set up against intrusions by Assyrians and Arabs from the E during the Persian occupation (2.30.107). Judith 1:9 (here *Taphnas*) and a Greek geographical papyrus (*T[.]aphnaiein,* damaged) both mention the site as one of several settlements along routes into Egypt (Noordegraaf 1938). A new Nabatean inscription from Tell esh-Shuqafiya dated to the last half of the 1st century B.C. mentions the site (Aram *Dpn*›) as the location of the shrine of the Nabatean god Dushares, suggesting a significant Nabatean commercial presence in Daphne at that late date (Jones et al. 1988). The *Antonine Itinerary* (late 3d century A.D.) mentions *Daphno* as being 16 Roman miles inland from Pelusium. Some manuscripts of the Latin account of the Christian pilgrim Egeria in the late 4th century A.D. mention *Tathnis/Tatnis* in the land of Goshen along the route of the city of Arabia to Pelusium, which has been identified by some as Daphne (where it reports that Moses was born), but this may be a scribal error for Tanis (Gingras 1970: 63–64, 186–88). A certain bishop Eulogius at the time of the great Athanasius (4th century) is mentioned in a Coptic source as being from *Taphnas* (Timm 1985). In the 6th century A.D., Stephanus of Byzantium mentions the site as *Daphno* which derived its name from the laurels (Gk *daphne*) which grew there (Ball 1942: 171). *Daphne/Taphnas* is also mentioned briefly in connection with Jeremiah in a few patristic writers (Timm 1985: 552 and references). There is also mention of a St. Isidore from *Dafnās* in a late Copto-Arabic source (Timm 1985).

In the Bible, most references to Tahpanhes are found in the book of Jeremiah, especially chapter 43. Jerusalem was about to be besieged. The governor Gedaliah had been assassinated, and those in the circle of Gedaliah feared for their lives and fled to Egypt, taking the aged Jeremiah and Baruch his scribe with them, as both were suspected of having pro-Babylonian sympathies. These Jewish refugees found asylum in Tahpanhes, just within the Egyptian frontier, where Jeremiah lived and uttered his last prophecies of which we have any knowledge (Jer. 43:8–13, and chapter 44), words which again condemned his people for their apostasy. Jeremiah, now presumably in his sixties, is heard of no more, and it seems probable that at Tahpanhes he spent his last days (Bright *Jeremiah* AB, CXI).

TAHPENES (PERSON) [Heb *taḥpĕnês* (תַּחְפְּנֵיס)]. An Egyptian queen whose sister married Hadad of Edom after he found refuge in Egypt when he fled from David (1 Kgs 11:19–20). Tahpenes is treated as a personal name, but it is probably a corruption of an Egyptian title, "wife of the king" *(t.hmt.nsw).* This reading is confirmed by the LXX which has a *mu* instead of the Hebrew letter, *pe,* in this name. She is called the "great lady" *(gĕbîrâ),* possibly indicating her position as "chief lady" of the harem and mother of the heir-apparent. The title, *gĕbîrâ,* is given to the queen-mother in Judah. Hadad's son, Genubath, is weaned by this queen and raised with the sons of Pharaoh. See Gray *Kings* OTL; Noth *Könige* BKAT.

TAHREA (PERSON) [Heb *taḥrē‹a* (תַּחְרֵעַ)]. See TAREA.

TALENT [Gk *talanton* (ταλαντον)]. "Talent" is also the RSV rendering of the Heb terms *kīkar* and *kīkār.* See WEIGHTS AND MEASURES.

TALIONIS. See LEX TALIONIS.

TALITHA CUMI. The Aramaic phrase, transliterated into Greek *(talitha koumi),* used by Jesus when he healed Jairus' daughter. This provides evidence for an Aramaic basis to the language of Jesus, because (1) it is a full sentence, and (2) *talitha* is from the Aramaic form of *ṭalyâ* ("lamb," "youth") and *koumi* reflects the feminine singular imperative form *qûmî* from the verb *qwm.* It occurs only in Mark's gospel, furnished with an explanation in Greek, *to korasion, soi legō, egeire* ("Girl, I say to you, get up!"). Here, however, the words *soi legō* ("I say to you") have no equivalent in the presumed Aramaic. There is a parallel of substance in Luke 8:54 which lacks those words, but which uses *hē pais* ("child") instead of *to korasion.* Both could easily reflect the same Aramaic original. However, Mark and Luke alike express the vocative here by using the definite article, and in this coincide with the use of the Aramaic emphatic state in the word *talitha* (Aram *ṭlyt›*), whereas in the similar cases in Luke 7:14b and John 11:43b the vocative itself is used.

It seems strange that anyone should have addressed an unconscious (or dead) person as "girl" and not by her own name. The context is thoroughly Jewish, the girl's father has a Jewish name (Jairus = *Ya›ir*), and he is a synagogue ruler. If his name is given, why not that of his daughter? Further, the Greek mss and the versions have problems in Mark 5:41. The best attested reading is *Talitha koum,* but at first sight that seems to make the verb masculine *(qwm)* instead of feminine *(qwmy).* The other three sets of readings all look like attempts to make sense of the matter by seeing in *talitha* (or in their equivalents for it) a proper name. Thus all make both subject and verb explicitly feminine. The problems could be solved if (1) *talitha* could be documented as a proper name and not just an Aram word meaning "girl," and (2) if in the spoken language the final *yod* in feminine form *qwmy* were silent as in the corresponding Syriac. In Acts 9:40 and John 11:43b the person being "raised from the dead" is addressed by name: since *Thaleththi* (= *Talitha*) has been attested in an epitaph of the 1st century A.D. from Tiberias in Galilee, *Talitha cum (i)* should possibly be read as "Talitha, stand up!"

The view that *talitha cumi* is a foreign word, part of the magician's mystique, is ingenious but fails to take account of the Jewish and indeed Aramaic nature of the whole setting of the story.
MAX WILCOX

TALLIT [Heb *ṭallît* (טַלִּית); *ṭallêt* (טַלֵּית)]. Ceremonial tassels worn in Judaism and ancient Israel. See DRESS AND ORNAMENTATION.

TALMAI (PERSON) [Heb *talmay* (תַּלְמַי)]. **1.** A descendant of Anak. Talmai, together with Ahiman and Sheshai, lived in Hebron when the spies were sent by Moses (Num 13:22). They were driven out by Caleb (Josh 15:14) and Judah (Judg 1:10). According to Num 13:33, they had descended from the Nephilim and were considered giants. In Judg 1:10 they are called "Canaanites."

2. The king of Geshur, the son of Ammihud. Talmai's daughter Maacah bore David's third son, Absalom, during David's rule in Hebron (2 Sam 3:3; 1 Chr 3:2). After the assassination of Amnon, Absalom fled for refuge to Talmai in Geshur and remained there three years (2 Sam 13:37–38).

PAUL R. RAABE

TALMON (PERSON) [Heb *ṭalmōn* (טַלְמֹן); *ṭalmôn* (טַלְמוֹן)]. A levitical gatekeeper, and head of one of the major families of postexilic gatekeepers; the name is found in five of the Chronicler's lists of temple personnel (1 Chr 9:17 = Neh 11:19; Ezra 2:42 = Neh 7:45 = 1 Esdr 5:28; Neh 12:25). Some scholars have questioned whether some of these lists (e.g., Ezra 2:42 and parallels) indicate the originally non-levitic status of the gatekeepers (cf. Williamson 1979: 253–54 n. 11; *Ezra, Nehemiah* WBC, 35, 347), but D. J. A. Clines (*Ezra, Nehemiah, Esther* NCBC, 55–56) is probably right to affirm the likelihood of the levitical status of the gatekeepers from the beginning, with only "terminological differences" being reflected in the various lists (also cf. Myers, *1 Chronicles* AB 120–21). The LXX lacks any reference to Talmon in Neh 12:25 (all six names are lacking in the earliest Greek mss); such omissions are quite common in Nehemiah 12, and they remain problematic. See AMOK. Although the MT does list six names in v 25, probably only the last three (Meshullam, Talmon, and Akkub) are meant to be understood as gatekeepers (*contra* the RSV); the first three names continue the list of singers found in the previous verse (Williamson *Ezra, Nehemiah* WBC, 356, 358 nn. 24.d., 25.a.; Clines *Ezra, Nehemiah, Esther* NCBC, 227; cf. Myers *Ezra-Nehemiah* AB, 194–95).

In regard to the meaning of the name "Talmon," Noth (*IPN,* 223) compared the Arabic word *ẓalmun,* "brightness, splendor," or the like (*Ḏ > *ṭ,* assuming Aramaic influence); he categorized this name as a "pet name," expressing the delight of the parents for their child.

Finally, some have pointed to the reference in Ezra 10:24 (cf. 1 Esdr 9:25) to the postexilic gatekeeper (clan?) of Telem (Heb *ṭelem*) as possibly an alternate form of the name "Talmon" (Clines *Ezra, Nehemiah, Esther* NCBC, 56). In support of such an identification, one might note the analogous appearance in the same verse of the name "Shallum" (= Meshelemiah = Shelemiah; see MESHELEMIAH), another prominent clan of levitical gatekeepers.

A. Definitions

The word "Talmud" means "study" or "learning." In *M. ʾAbot* 4:13—"Be heedful in *talmûd,* for an unwitting error in *talmûd* is accounted a willful transgression"—"Talmud" refers to the opinions and

teachings students acquire from their teachers. In *b. B. Meṣ.* 33a, it indicates the totality of one's acquired knowledge: "He from whom one has acquired the greater part of his *talmûd* is to be regarded as one's teacher" (Berkovits *EncJud* 15: 750). However, talmud most frequently denotes the two collections of materials, one from Palestine and one from ancient Babylonia (modern Iraq), which are organized as commentaries to the Mishnah, which tradition assigns to the leader of the Palestinian Jewish community at the beginning of the 3d century C.E., Judah the Patriarch. Because the Babylonian Talmud became for European Jewry the more important of the two, "the Talmud" usually refers to that document. This collection is also known as the *ŠaS,* an abbreviation for *Šiššâ Sidrê mišnâ,* "the six orders of the Mishnah," the *Gemara* (Aram *gĕmārā›*), from the Heb root, *gmr,* which means "completion," or the *Bablî* (pronounced bavli), the Hebrew adjective "Babylonian."

The Talmud compiled in Palestine is called in the traditional texts "the Gemara of the land of Israel," "the Talmud of the land of Israel," "the Talmud of the West," and "the Gemara of the people of the West." At times the North African Rabbi Nissim (ca. 900–1062 C.E.), names a tractate to which he appends the phrase "of the children of the West." The term *Yĕrûšalmî,* a Hebrew adjectival form of Jerusalem, is used commonly by the North African sage Hananel ben Hushi'el (d. 1055/56 C.E.), occasionally by R. Nissim, by Isaac ben Jacob Alfasi (1013–1103 C.E.), and by many medieval European sages. The earliest printed edition of this text, published in Venice, and the only complete ms of the document, the Leiden Manuscript, both employ the term "Talmud Yerushalmi." The Meiri, Rabbi Menahem ben Solomon (1249–1316 C.E.), a Provencal sage, refers to the document as the Western Talmud (Bokser 1979: 150–51).

If the Jews are "a people of the Book," that book is the Talmud, especially the Babylonian Talmud. The Babli sets forth the outline of a system of Judaism which is adhered to today. The modes of religiosity in the Hebrew Bible focus on the priests offering sacrifices to YHWH, usually at the altar/Temple in Jerusalem. The leaders of the community, whose ideal place of residence was within the land of Israel, were the kings, anointed by YHWH's representatives, the priests, eventually an inherited office, and the prophets, called by YHWH. With the end of the monarchy in 586 B.C.E., the end of prophecy before the Maccabean period, the destruction of the Temple in 70 C.E., and the decline of the Palestinian centers of Judaism after 220 C.E., the Jews had to discover new ways of approaching YHWH. The outlines of the new system were set forth in the two Talmuds (Heb *talmûdîm,* plural of *talmûd*). The Babylonian Gemara became the foundation-document of Central European and American Judaism, while the Yerushalmi served the Jews of the Mediterranean world. YHWH's representatives were now the rabbis, who achieved their status by mastering both the Written Torah, the Hebrew Bible, and the Oral Torah, the rabbinic traditions which "originated" with Moses, our rabbi. Sacrifices were replaced by prayer, study, and good deeds, and the community outside of the land of Israel waited for its return to the holy land at the time of the Messiah (Neusner 1965–70). The Talmuds are our major sources of information about the Jews of late antiquity. While we have other written materials by Palestinian Jews—such as the *targûmîn* (Aramaic translations of the Hebrew Bible), *midrāšîm* (collections of biblical exegeses), and some liturgical and magical texts—and some archaeological artifacts—such as tombs, synagogues, and inscriptions—the Yerushalmi remains our primary source of information about Palestinian Judaism in late antiquity (*HJP²* 3/1; Meyers and Strange 1981; Smallwood 1976; Avi-Yonah 1976). For the Jews of Babylonia, with the exception of a very few archaeological finds—such as the Dura synagogue and the magical bowls of Nisibis—the Babli is our sole source of information about their way of life, their system of beliefs, their modes of thought, and their interpretations of the Hebrew Bible (Neusner 1965–70). Therefore, in order to gain information about the Jews of Late Antiquity, one must delve into the two Talmuds.

The sages cited in the Talmuds are known as Amoraim (Aram *›ămôr›āyim*), the sayers, for their statements are usually introduced in the Gemara (commentary section) by the Heb root *›mr,* "says." The masters who appear in the Mishnah and related documents are known as Tannaim (Heb *tannā›îm*), from the Heb root *tnh,* to teach or repeat, because their sayings are introduced in the Gemaras (Aram *gĕmārôt,* plural of *gĕmārā›*) by some form of the root *tnh.* The Amoraim are followed by the Seboraim (Heb *sĕbbôrāyim*), a plural noun from *sbr,* to reason, who are in turn followed by the Geonim (Heb *gĕ›ônîm*) (a

plural noun meaning learned), which is usually applied to the heads of the Babylonian academies at the time of origins of Islam.

The text of the Babylonian Talmud consists of some 2.5 million words, on 5,894 folio pages. About one-third is Halakah (Heb *hălākâ*), legal material or statements of law, while two-thirds is Aggadah (Heb *ʾaggâdâ*), that is, stories, anecdotes, legends, and the like. Interestingly, much of the Aggadah in the Babylonian Talmud seems to have been of Palestinian origin. Only one-sixth of the Palestinian Talmud consists of Aggadah. Some argue that because only the Palestinian sages produced a distinct genre of biblical exegetical texts, the *midrâšîm,* which contains a good deal of Aggadah, they were able to include much less Aggadah in their talmud than did the Babylonian Amoraim (Goldberg 1987a: 336).

B. Content

The two Talmuds differ in scope, language, style, and content. The Palestinian Talmud contains a Gemara to 39 of Mishnah's 63 tractates, occurring in 4 of the base document's 6 major Orders: *Zeraʿim,* Seeds; *Moʿed,* Festival; *Našim,* Women; and *Neziqin,* Torts. It also includes a Gemara to the first 3 chapters of the tractate *Niddah,* Menstruant Woman, which appears in the Order *Ṭoharot,* Purities. However, not all of the tractates are complete: There is no Gemara to the third chapter of tractate *Makkot,* Lashes, in *Neziqin;* to the 21st through the 24th chapters of *Šabbat* in the Order *Moʿed;* or to the 4th through the 10th chapters of *Niddah.* The Palestinian Talmud does contain a Gemara to all of the tractates of *Zeraʿim* and to tractate *Šeqalim* of the Order *Moʿed.* A version of the missing chapter of *Makkot* has been found in the Cairo Geniza. Although some medieval authorities refer to the existence of a Palestinian Gemara to *Qodašim,* Holy Things, and *Ṭoharot,* most scholars agree that none actually existed, and no fragments of these have yet appeared (Rabinowitz *EncJud* 15: 772–74, Bokser 1979: 167–68).

Only 37 of the 63 tractates of the Mishnah receive a connected commentary in the Babylonian Talmud. Materials from the remaining 26 are scattered throughout the text. With the exception of *Berakot,* Blessings, there is no Babylonian Gemara to the tractates in *Zeraʿim.* The Order *Moʿed* is complete in the Babylonian Talmud, with the exception of *Sheqalim,* which does appear in the Palestinian Talmud. Furthermore, the Babylonian Talmud, like the Palestinian Talmud, does not contain a Gemara, to *Eduyyot,* Testimonies, or *Abot,* Fathers. The *Gemara* to *Qodashim* is almost complete in the Babylonian Talmud, with the exception of *Middot,* Measurements, *Qinnim,* Bird-offerings, and part of *Tamid,* Daily Whole-offering. Similar to the situation in the Palestinian Gemara, *Niddah* is the only tractate of *Ṭoharot* which has a Gemara in the Babylonian Talmud (Berkovits *EncJud* 15: 757, Goodblatt 1979: 259). Steinsaltz (1976: 279–83) and Berkovits *EncJud* 15: 751) contain a convenient chart which compares the content of the two Talmuds to the chapters of Mishnah. Krupp summarizes the contents of the various manuscripts of the Palestinian Talmud (1987b) and provides a chart of the contents of the major manuscripts of the Babylonian Gemara, tractate by tractate (1987a).

Both Talmuds are composed in Aramaic as well as Hebrew. The Aramaic of the Babylonian Talmud is classified as Eastern Aramaic, while that of the Palestinian Talmud is known as Western Aramaic. The Babylonian text contains some Persian loan-words, and the Palestinian document contains a considerable amount of Greek in a Syrian-Palestinian dialect. The Hebrew in the Talmuds represents several types: Biblical Hebrew, in quotations from the Hebrew Bible, early Middle Hebrew, especially in the quotations from the Mishnah, and late Middle Hebrew, a post-Mishnaic form of Hebrew. However, because the copyists and printers who transmitted the Talmudic texts often "corrected" the orthography, morphology, syntax, and lexica of the documents to conform to more widely known forms of Hebrew, it is extremely difficult to recapture the traits of the original languages of these documents (Goodblatt 1979: 273–80, Goldberg 1987b: 305, Rabinowitz *EncJud* 15: 774, Bokser 1979: 201–8, Ginzberg 1970: 8).

Many who have compared the Palestinian Gemara to its Babylonian counterpart have observed that the comments in the former are briefer and more focused (Halivni 1986: 82). Its discussions are frequently shorter, more elliptical, less clear, and often enigmatic (Bokser 1979: 170), when compared to those in the Babylonian Talmud. The Palestinian pericopae frequently lack editorial introductions and connections. A passage may consist of nothing more than the juxtaposition of a Tannaitic text which seems to be at variance with the relevant section of Mishnah and a reconciliation of the two. Or, the section may open by

quoting an Amoraic statement to which Tannaitic sources or other Amoraic statements are found to support or to contradict it. If the quoted texts disagree, the Amoraim frequently seek to smooth out the differences (Goldberg 1987b: 307). On the other hand, the Babylonian Gemara contains elaborate pericopae which have been described as "colorful, pulsating, outreaching, often presenting an interwoven and continuous discourse …" (Halivni 1986: 82). Although scholars disagree concerning the number of layers one can discern in the Babylonian Gemara, they all point to the elaborate ways in which the units have been constructed.

The differences in style between the two documents is no doubt partly the result of the fact that of the two Talmuds, only the Babylonian went through a protracted period of compilation and editing. Depending upon which scholarly theory one accepts, the Seboraim, and even the Geonim, worked at completing, compiling, editing, and polishing the Babylonian text before it found its way into the communities of medieval Europe. Even if one accepts the traditional dates for the completion of the two Talmuds, the Babylonian Gemara had at least a century more of development than did its Palestinian counterpart (Goldberg 1987b: 305–6).

In addition to differing in style, in general terms the content of the two Talmuds is dissimilar. Scholars have long noted that angelology, demonology, sorcery, magic, astrology, and other folk beliefs are much more prominent in the Babylonian Talmud than they are in the Palestinian Gemara (Ginzberg 1970: 20–24, Goldberg 1987b: 306), even occurring in Babylonian retellings of Palestinian materials (Goldberg 1987a: 336). However, the difference between the content of the two Amoraic collections is much more fundamental and relates to the differing ways in which the two Amoraic texts approach their base document, Mishnah. Goldberg suggests that the Palestinian Talmud does for the Tosefta (additional tannaitic materials) what that document does for Mishnah; that is, it expands upon Tosefta in the same way that Tosefta, in Goldberg's view, expands upon Mishnah (Goldberg 1987b: 311)." However, the Palestinian Gemara may "correct" or interpret Mishnah, limiting or expanding its applications, totally without recourse to Tosefta (Goldberg 1987b: 312). Rabinowitz (*EncJud* 15: 772) writes that while the sages in the Babylonian Talmud go "to the most extreme lengths to justify the original text of the Mishnah, explaining differences and difficulties by stating that there are lacunae or that the author of one section is not the same as that of others, the Amoraim of the Palestinian Talmud freely and explicitly amend the text of the Mishnah, sometimes without any ostensible reason." Neusner writes that the Palestinian Gemara "appears in the main to provide mere commentary and amplification for the Mishnah" by doing one of four things to it: " (1) text criticism; (2) exegesis of the meaning of the Mishnah, including glosses and amplifications; (3) addition of scriptural proof texts of the Mishnah's central propositions; and (4) harmonization of one Mishnah passage with another such passage or with a statement of Tosefta" (1986: 18). He estimates that 90 percent of the Palestinian Gemara focuses on Mishnah. The other 10 percent of the *Yerushalmi* contains (1) theoretical questions of law not associated with a particular passage of the Mishnah, (2) exegesis of Scripture separate from Mishnah, (3) historical statements—stories about things which happened, and (4) stories about and rules for sages and disciples, separate from discussions of a passage of the Mishnah (Neusner 1986: 19–21). In brief, most scholars agree that the Palestinian Gemara is much more focused on Mishnah than is the Babylonian Talmud.

Like the Palestinian Talmud, the Babylonian text devotes substantial efforts to explaining, interpreting and amplifying Mishnah. Both Talmuds seek to discover how the Hebrew Bible serves as a basis for Mishnah's statements, and they both employ Tosefta as an aid to comprehending Mishnah. However, Neusner finds "a greater tendency in the Babylonian Talmud to speculate on law beyond the framework of a Mishnah paragraph" (1986: 92–93). For Neusner, the major difference between the content of the two Talmuds is in regard to their use of, and reference to, the Hebrew Bible. He estimates that the Babylonian text contains four to five times more scriptural units than the Palestinian Gemara (1986: 100). Further, only the Babli uses scriptural units independently of its interpretation of Mishnah, for the framers of the Babylonian Talmud "were prepared to organize their larger composition around more than the single focus of a context of discourse dictated by the Mishnah or by points of law or theology deemed pertinent to the Mishnah" (Neusner 1986: 104). To summarize: The Babylonian Talmud contains a good deal more

material which is unrelated to Mishnah than does its Palestinian counterpart. And, the Babylonian Gemara includes many more scriptural units than does the Palestinian Talmud.

C. Editorial History

The Palestinian Talmud does not provide us with any information concerning its editing (Rabinowitz *EncJud* 15: 772); however, we can deduce from the events included and omitted from the text as well as from the names of the sages quoted in the document that the Gemara was edited sometime shortly after the end of the 4th century C.E. (Bokser 1979: 192). Rabbi Moses ben Maimon (Maimonides, 1135–1204 C.E.) claimed that Rabbi Yohanan (died last quarter of the 3d century C.E.) edited the Palestinian Talmud. Moses ben Jacob of Coucy (13th century) emended Maimonides' text to read "Yohanan and his disciples" (Rabinowitz *EncJud* 15: 772). Given Yohanan's central place among the Palestinian rabbis, this statement is probably true; however, it is so general as to be meaningless. The Palestinian text seems to come from the three major Palestinian amoraic academies—Tiberias, Caesarea, and Sepphoris. The sages from the fourth center of Palestinian *amoraim,* Lydda, did not leave much material (Rabinowitz *EncJud* 15: 772). The consensus of modern scholarship is that the bulk of the Palestinian Gemara was compiled finally at Tiberias (Bokser 1979: 193). Lewy had argued that the Gemara to *Neziqin* was different from the rest of the Palestinian Gemara, and Lieberman argued that *Neziqin*'s distinctive traits derive from its being composed in Caesarea earlier than the other portions of the Talmud. Most scholars believe that the anonymous parts of *Neziqin* derive from Caesarea, while those elsewhere in Palestinian Talmud ostensibly derive from Tiberias (in Bokser 1979: 193). The material in *Neziqin* consists of short comments, of almost exclusively halakhic (legal) content. It differs in brevity, style, and terminology from the rest of the Talmud. The first three Orders, the remaining tractates of *Neziqin,* and the tractate *Niddah* were edited at Tiberias. Although, the Yerushalmi is not the work of one school (Rabinowitz *EncJud* 15: 313–14). Many scholars have argued that the Palestinian Talmud was committed to writing during the 4th and 5th centuries because of the oppression experienced by the Palestinian Jewish community at that time. Recently these arguments have been demonstrated to be flawed, and they can now be dismissed (Bokser 1979: 197–79).

The editing of the Babylonian Talmud has received a good deal of scholarly attention, most of which Neusner (1970) and Goodblatt (1979: 291–318) have summarized. The traditional view, based on a few ambiguous passages from the Babylonian Gemara, a letter of Sherira ben Hanina Gaon of Pumbedita (ca. 906–1006 C.E.), and a comment by Rabbi Solomon ben Isaac of Provance (Rashi, 1040–1105), attributes the final editing of the Babylonian Talmud to Rav Ashi (died 427/28) and Ravina II (ca. 500). The traditional view does recognize the fact that traditions were produced after Ashi and Ravina, for even Sherira mentions R. Yose, one of the Seboraim, during whose days the Babylonian Talmud reached its ultimate conclusion (Berkovits *EncJud* 15: 761).

Goodblatt (1979) suggests that most modern scholars adhere to some form of a "two-source" theory of the editing of the Babylonian Talmud. Weiss argued that each generation and center of Amoraim produced its own talmud, some of which are still identifiable. He attributed the earliest stratum to Yehudah b. Yehezqel, head of Pumbedita, in the late 3d century, and claimed that it was based on material formulated by Rav and Samuel (middle 3d century), statements of other great Babylonian Amoraim, and some tannaitic material. However, this "talmud was limited and did not cover early tractate." The second recognizable stratum originated in the early 4th century, in Pumbedita under Abayye, and it covered all of the tractates we have in our present Gemara. Rava took this edition with him to Mehoza where it was further supplemented. Later generations continued to add to this edition as it was adopted by the Naresh school under R. Papa and by the school of Sura under R. Ashi (in Goodblatt 1979: 292). Kaplan claims that the Seboraim were the final editors of the Talmud. The Gemara, brief summaries, was produced by the Amoraic academies. The Seboraim took the Gemara collected by Ashi, rearranged it, and added to it Gemaras from other Amoraic academies and other uncollected oral material, so that "the gemara of R. Ashi, accompanied by the Saboraic exposition, make up the bulk of the present Talmud" (in Goodblatt 1979: 314–15). Similarly, Klein writes "the compilation of the Gemara was in fact the work of R. Ashi and Rabina … Sebara [was] added during the 6th and 7th centuries" (in Goodblatt 1979: 315).

Halivni has produced the most recent variation on the "two-source" theory. He argues that the Amoraim followed an apodictic form; they merely stated the law, without preserving the "give-and-take" that stood behind their legal conclusions, a style which closely follows the Mishnah (1986: 76, 52–70). It was the anonymous authorities, the Stammaim (Heb *sĕtāmmayim*) who flourished between 427 and 501 or 520 C.E., who recovered or invented the discursive material which now makes up the bulk of the Babylonian Gemara (1986: 76). The Stammaim created a "flowing discourse" by completing what was missing in the Amoraic text through conjecture and restoration, and by adding introductions, conclusions, and interpolations to the Amoraic material they had received. The Stammaim believed that opinions rejected by the Amoraim were not false; they were rejected for only practical reasons, so that from the point of view of religiosity "even the rejected view was acceptable" (1986: 77). Halivni concludes, citing Occam's razor, "that the redaction of the Talmud was done at one time …, after R. Ashi's death, reaching its greatest intensity in the last quapter of the 5th century" (1986: 81).

Looking at the broader picture, however, all of the above versions of the two-source theory, as well as the traditional view, are questionable. Masters who flourished in the early 6th century appear in the Gemara. It seems probable that major redactional activity, which included substantive additions to the text, continued through the 6th and 7th centuries. Also, extensive materials attributable to authorities of the 8th and 9th centuries found their way into the Babli. Furthermore, the text as we have it today contains glosses and comments from the middle ages. Additionally, copyists and printers freely emended the text, "on the basis of conjecture or variants in mss, until modern times." Also, the printed editions of the 19th century, on which all modern printings are based, contain emendations suggested by the commentaries of the 16th through the 18th centuries. And, both Jewish and non-Jewish censors deleted potentially offensive passages and replaced sensitive terms with more neutral ones. Goodblatt writes:

> Through the 7th century, there seems to have been no hesitation to add freely to the text. Beginning in the 8th century conscious substantive changes were no longer made. From then on additions were mainly the result of marginal notes finding their way into the text. Moreover, in the 8th century independent compositions by rabbinic masters begin to appear. All of this suggests that by the latter date BT was considered a finished work. A 10th century Talmudist claims that a deposed Babylonian exilarch who arrived in Spain ca. 770 wrote out from memory the complete text of the Talmud. (1979: 264–65)

D. Textual History

There is only one complete ms of the Palestinian Talmud: the Leiden Manuscript, Codex Scaliger 3, written in 1289 (Krupp 1987b: 320, Rabinowitz *EncJud* 15: 776, Bokser 1979: 153) by Jehiel ben Jekuthiel ben Benjamin ha-Rofe. Jehiel indicates that he relied on a corrupt text which was full of errors (Rabinowitz *EncJud* 15: 776); however, Krupp (1987b: 320) writes that "the prototype was better than the copyist judged it, whose emendations were unimportant and did no damage elsewhere." The earliest printed edition of the Palestinian Talmud was produced in 1523–24 in Venice by Daniel Bomberg. Krupp (1987b: 320) states that "the real damage" to the Talmud's text "was done by the 'improvements' and arbitrary changes, additions and omissions of the compositor of the Bomberg edition." The Venice Edition serves as the basis for subsequent printed editions of the Palestinian Talmud. There is a Vatican ms, Talmud Yerushalmi Codex Vatican 133 (Vat. Ebr. 133), perhaps from the 13th century, which contains the tractate *Soṭah,* and the whole order of *Zeraʿim,* except for *Bikkurim.* (Rabinowitz *EncJud* 15: 776–77, Bokser 1979: 155). The tractates in the Palestinian Gemara are divided into chapters and Halakot, following the divisions in its Mishnah, and the text is cited in that manner. Therefore, *Ber.* 3:1 refers to the first Halakah of the third chapter of tractate *Berakot.* The Venice edition was printed in two columns on each side of the page. Citations of the text are based on columns a and b appearing on the obverse, and c and d on the reverse. Therefore, *Ber.* Venice 3a refers to the inside column on the obverse side of the third page of tractate *Berakhot. Ber.* 3d indicates the inside column on the reverse side of the same page. For a discussion of the other available mss and editions of the Palestinian Talmud see Bokser (1979: 151–63) and Krupp (1987b). Schwab produced a generally unreliable French translation of the Palestinian

Talmud in eleven volumes in 1871, and Wunsche translated the aggadic portions into German in 1880. Recently Neusner (1982–89) has undertaken the only English translation of the Palestinian Talmud.

A Bodleian Library ms covering half of the tractate *Keritot,* dated to 1123, is the oldest ms of the Babylonian Talmud listed by Krupp (1987a: 366); however, Berkovits (*EncJud* 15: 765) notes that there is a ms of *Pesaḥim* at Cambridge that "may date" to the 9th century. The Codex Florence, dated to 1177, contains about one-third of the Babylonian Gemara, and the Codex Hamburg, dated to 1184, contains the first three tractates of *Neziqin.* Codex Munich 95 written in Paris in 1343 is the oldest complete ms of the Babylonian Talmud (Goodblatt 1979: 265). The first complete edition of the Babylonian Talmud was produced in 1520–23 in Venice by Daniel Bomberg. Because there is no Babylonian Gemara to *Šeqalim,* Bomberg appended the Gemara from the Palestinian Talmud. This edition also includes the Palestinian version of *Horayot* (Bokser 1979: 151). Bomberg's pagination has become standard. He printed the Gemara on numbered folio pages, with one column of the text on each side of the page. The column on the obverse side is designated a, that on the reverse b. Because Bomberg used the first page as his title page, each tractate of all present-day editions of the Babylonian Talmud begin on page two. Sections of the Gemara are cited according to Bomberg's pagination; therefore, *Ber.* 12a refers to the obverse side of the twelfth folio page of tractate *Berakot.* In addition Bomberg's placement of Rashi's commentary on the side of the page closest the binding and the comments of the Tosafot (Rashi's grandsons) on the outside of the page is followed in all modern editions of the text. Most 20th century editions reproduce the Romm edition published in Vilna between 1880–86 (Goodblatt 1979: 268). Goldschmidt produced a German translation of the complete Babylonian Talmud. The standard English translation was published under the editorship of I. Epstein (1935–52). Recently, Neusner (1984–85) has undertaken a new English translation of the Babylonian Talmud.

GARY G. PORTON

TAMAR (PERSON) [Heb *tāmār* (תָּמָר)]. The name of three women in the OT. The name may mean "palm (tree)" (*IPN* 230).

1. In Genesis 38, the Canaanite woman who was married to Er, Judah's first son by the Canaanite daughter of Shua. After Er was slain for his wickedness by God, Judah asked his next son Onan to perform the task of levirite marriage with Tamar. Onan, however, attempted to avoid issue with her by

practicing coitus interruptus, and for this he too was killed by God. When Judah tried to save his last son Shelah by delaying giving Tamar to him, she took matters into her own hands. Disguising herself as a prostitute, she had relations with Judah. When he discovered her pregnancy and his own role in it, Judah declared her to be more righteous than he since he had withheld Shelah from her. She bore twin sons, Perez and Zerah and through Perez was an ancestress of David (Ruth 4:12, 18–22; 1 Chr 2–4) and Jesus (Matt 1:3).

The story has been the focus of much recent research dealing with such questions as its origins (Emerton 1979), its function within the Joseph story, especially through a literary analytical approach (Alter 1975), and the reasons for Tamar's actions (Coats 1972; Niditch 1979).

2. The daughter of David and Maacah and the full sister of Absalom, with whom Amnon, her half-brother, fell violently in love (2 Sam 13:1–22). On the advice of his friend Jonadab, Amnon feigned illness and asked that Tamar be sent to feed him. When she arrived, he raped her; and then, his love having turned to hate, threw her out. Tamar fled to Absalom who ultimately avenged her violation by having Amnon killed.

The story has recently been the subject of much literary and structural analysis (Conroy 1978; Fokkelman 1981) underscoring its role within the larger treatment of Absalom's revolt (2 Sam 15–20).

3. The only daughter of Absalom, undoubtedly named after his sister, and described as a beautiful woman (2 Sam 14:27). Some scholars have equated her with Maacah, the wife of Rehoboam, son of Solomon, and the mother of Abijah (1 Kgs 15:2; 2 Chr 11:20–22). This is because some manuscripts of the LXX and the OL have in 2 Sam 14:27 "Maacah" instead of "Tamar", and a further statement in the LXX adds that she was the wife of Rehoboam and the mother of Abijah. McCarter (*II Samuel* AB, 342) notes that it is possible that the original reading for the name in the passage of Samuel was "Maacah" and that Tamar's name replaced it in the MT by confusion with Absalom's sister, prominent in the preceding chapter. However, he prefers to assume that the name Maacah along with the statement about her marriage arose in the LXX through an unfounded scribal equation of the daughter of Absalom, son of David, with the daughter of an otherwise unknown Absalom mentioned in 1 Kgs 15:2. Other scholars have seen Tamar as the mother of Maacah (Dahlberg *IDB* 3: 196).

GARY H. OLLER

TAMAR (PLACE) [Heb *tāmār* (תָּמָר)]. A perplexing site located in the Judean Arabah region, SSW of the Dead Sea. Establishing the precise location has been difficult because of the lack of existing toponyms commonly used for identification. One possible location is found in the area of Qasr el-Juheiniya (M.R. 173048) 21 km WSW of the Dead Sea, where the Roman fortress of Thamara is speculated to be. Another possible location is believed to be Ain Hoseb (M.R. 173024) 40 km SW of the Dead Sea. The biblical Tamar is included in the traditional border with the SE nation of Edom and is distinguished as the future E boundary of Israel in Ezek 47:13–48:29. In Ezek 47:18, the LXX and Syr both support the reading of "as far as Tamar" *(tāmārā),* instead of the MT version "you shall measure" *(tāmôddû);* placing the city in the area of the extreme SW boundary.

Problems have arisen in Ezek 47:19; 48:28 with the Semitic name of Tamar confused with the city of "Teman" mentioned in the LXX. In these verses the translators of the LXX use the name Teman (Gk *thaiman kai phoinikōnos* [Teman and palm-tree] and *thaiman*) for the location. Teman was an Edomite locale situated in the same geographical area Tamar was thought to occupy. See TEMAN. The misconception may be attributed to the similarities in the consonantal form of both words and the

previous boundary lists found in Josh 15:1–4 and Num 34:3–5. Both use Edom as the marker for the S boundary. Also note that Teman may be understood to mean "south," adding to the difficulty of the text.

Another disputed identification is found among Solomon's building sites in 1 Kgs 9:18. Here the Ketib reads "Tamar," while other mss and the Qere vocalization supports "Tadmor" as in 2 Chr 8:3. This N Syrian city is situated about 190 km NE of Damascus. See TADMOR. Though problems inherently arise by taking one reading over the other, it is generally thought to be important to maintain that the original reading was Tamar, not only because scholars prefer the more difficult reading, but also because it seems more plausible historically due to its strategic location with respect to the S trade route. The inconspicuousness of the distant Tamar could have contributed to the confusion with Tadmor. Again Tamar and Tadmor are similar orthographically and have same denotation, contributing to the misidentification. The mistake could have been in the simple replacing the more obscure name of Tamar with the more known and prosperous Syrian city Tadmor.

Other references to Tamar may be associated with this site are found in Gen 14:7 and 2 Chr 20:2, where Tamar is identified as Hazazon-tamar (in the 2 Chronicles passage the author places a note connecting it with En-gedi). Since the name Tamar signifies "palm," it is also thought to be referred to in Judg 1:16, the "city of palms," which is mentioned as the departure point from which the Kenites moved into the wilderness of Judah; however, this reference is probably about Jericho, which is often described as the city of palms (Judg 3:13; Deut 34:3; 2 Chr 28:15).

JEFFREY K. LOTT

TAMARA (M.R. 173048). A Cisjordanian Roman *Limes castellum* mentioned in the *Notitia Dignitatum* (36, p. 47, 46), and until now, the only one that has been excavated. The identification proposed by A. Alt (1935) has been sustained by the excavators, based now on archaeological and literary evidence (Gichon 1976a: 80–81).

Tamara (Qasr el Juheinije) was built by the Nabateans in the 1st century C.E. to protect the highway from Moab through Zoar to Mampsis. It seems to have been taken over by the Romans immediately on their acquisition of Nabatea in 105/6 C.E. until the reign of Hadrian.

After its refurbishing under the Illyrian emperors (Propbus?, 276–281 C.E.), the *castellum* stood until the Arab conquest (634/35). About 279 C.E., the inner portions were completely rebuilt. This and subsequent repairs are attributed to damage caused either by hostile attacks or earthquake, for which archaeological and literary evidence exists (Gichon 1976a: 82).

According to the *Notitia*, the cohors I Palaestinorum, an indigenous infantry regiment, was stationed at Tamara. During the 4th or 5th century this unit was converted to the status of farming militia and the soldiers and their families began farming the surrounding scattered arable plots, doing service in the *castellum* in turns. On the eve of the Moslem invasion of 634 C.E., some of the families found refuge in the *castellum* for a lengthy period and arrangements for their accommodation were made. The final conquest brought much internal destruction, and the site was never permanently resettled.

To ensure the collection of the water from the few winter rains, the *castellum* was built on the lowest spot of a natural trough where the drainage from the surrounding slopes converged. It was then easily channeled into intramural cisterns and more extramural reservoirs, which served the passing caravans. Since the highway was forced to pass through the valley, the site was positioned to ensure maximum control of passage. To compensate for the loss of visibility, a ring of observation posts crowned the surrounding crests.

Excavations were carried out from 1973 to 1976. The *castellum* is a well preserved square building, built of ashlars of varying quality, which are arranged in two faces with a rubble fill. The joints apparently were later repaired and straightened. The building measures 38 × 38 m, with four protruding towers which measure 6 × 6 m each—a typical *tetrapyrgos.* Of the four barrack blocks leaning against the walls, which are preserved 3.5 m above the floor, two obviously served as living quarters and the other two were devoted to other various purposes. See Fig. TAM.01. The following arrangement was preserved through all four construction phases: Phase I: Nabatean construction and occupation; Phase II: Roman takeover

and evacuation in about 135 C.E.; Phase III: Probus' reoccupation until the Persian invasion in 614; and Phase IV: Heraclius reoccupation in 628 and final destruction in about 634.

The Nabatean structure lacked the corner towers and had deeper barrack blocks. The towers, not less than 6 m high, were added in phase II and in phase III, the SW and SE barracks were diminished in size. The 6 section rooms *(contubernia)* measured 3.10 × 4 m, but a shaded portico with a roof resting on square pilasters was added. The NW and SW corners housed the higher charges, while the commander occupied a flight of rooms adorned with wall frescos in geometrical patterns (rank obviously carrying its privileges). The other barracks included the regimental shrine *(sacellum),* stores, armory *(armamentarium),* office *(officium),* and a large bakery. The single, 7 m deep gate, had a barrel vault and was divided into three compartments. A guard room led into the gate passage, which could be closed with doors and beams on both sides. In phase IV, the entrance was narrowed from 1.50 m to 0.80 m, emphasizing the largely static character of the garrison. Access to the battlements was gained by three flights of stairs, while the towers apparently had wooden ladders, which could be removed to enhance their defensive capabilities in the event of hostile penetration.

The large cistern, dug into the center of the courtyard, measured roughly 10 × 10 × 3.80 m. Its roof of heavy stone slabs was supported by ten stone pillars.

Obviously, Tamara could not house a complete unit, part of which must have been spread out to man the surrounding outworks and minor fortifications. Tamara and its support facilities was a fortification typical to the *limes* Palestine.

MORDECHAI GICHON

TAMARISK. See FLORA.

TAMMUZ [Heb *tammûz* (תַּמּוּז)]. The fourth month of the Hebrew calendar, roughly corresponding to June and July. See CALENDAR (ANCIENT ISRAELITE AND EARLY JEWISH).

TAMMUZ (DEITY) [Heb *tammûz* (תַּמּוּז)]. The Mesopotamian god Tammuz (SumDumuzi) is well attested from the 3d through the 1st millenniums B.C.E. The origins of the cult of the deity precede our written records, but it has been suggested that, like Gilgamesh, Dumuzi was once a Sumerian ruler who became revered as a god (Falkenstein 1954: 63; Gurney 1962: 150; Alster 1972: 15). Whether or not a human stands behind the divine figure, it does appear certain that Mesopotamian traditions concerning the god adapted various earlier religious themes into his character (Jacobsen 1970: 73–74). The figure which emerges as the deity is that of a shepherd. Various textual traditions survive regarding the god, but they reflect a plurality of traditions, making a consistent representation of the god difficult (Alster 1972: 13).

Early in the 20th century Tammuz was taken to be the classic example of the "dying-and-rising" god. Based on the work of Frazer (1935: 6), this position saw Tammuz as the divine representation of the life cycle of crops and therefore a vegetation deity (Langdon 1914: 114). It was held that the god died with the plants and rose again when they reappeared the next season; the cult, it was maintained, spread from Mesopotamia throughout the ancient world and was found with assorted names given for the Tammuz deity from Egypt (Osiris) through Palestine (Eshmun) into Greece (Adonis). Even the Christian Christ story was related to the myth (Frazer 1935: 6; Langdon 1914: 1; Moortgat 1949: 142–43; Kramer 1969: 133, 160 n. 48; Burkert 1979: 105–11). With the recognition that Tammuz was a shepherd, the death and rising of the god became less obvious (Falkenstein 1954: 65; Kramer 1951: 1–17). A fragmentary end of a

myth has been suggested as evidence for Tammuz' return from the dead (Falkenstein 1965: 281; Kramer 1966: 31), but this material is open to more than one interpretation.

Most of the material which has been preserved concerning the god relates him to the cult of Inanna/Ishtar. The courtship and marriage of these two deities have been recorded in numerous poems for her cult and have been taken at times to be examples of fertility rite liturgies. It is the myth of Inanna's Descent which supplies the best known rendition of the death of the god; she sends her husband to her sister Ereshkigal since someone must take her place among the dead. It would seem to be this story which is alluded to in the Gilgamesh Epic (VI: 46–47). Here Inanna/Ishtar assigns annual weeping in the cult for Tammuz, while the context suggests duplicity on her part toward him; this is no doubt what the women are observing at the Jerusalem temple when Ezekiel describes their apostasy (Ezek 8:14). Yet there are other mythological sources for Tammuz which do not include the goddess, perhaps the most intriguing being "Dumuzi's Dream" as it presents a totally different version of the death of the god, one related to his being a shepherd (Gurney 1962: 153; Miller 1980: 50). Other minor works also dwell upon the fact that Tammuz is dead (Gurney 1962: 154), so this aspect of the cult of the god appears to be consistent, while a return to the living is, at best, conjectural. Aside from Ishtar/Inanna, Tammuz' sister Geshtinanna is the most commonly reappearing figure in the texts dealing with Tammuz; his mother's name is given as Turtur.

The reason for Tammuz worship appearing in Jerusalem has been debated for some time. Both the Babylonians and the Assyrian revered Tammuz in their pantheons (Moortgat 1949: 93, 122) but neither would have been apt to require worship of this rather minor deity as a political acknowledgment of their rule (McKay 1973: 68–69). It is possible that the cult arrived in Judah without political sanction and it has been suggested that "Tammuz" is used in the text to refer to an indigenous deity (Ringgren 1966: 97), though the latter is unlikely.

LOWELL K. HANDY

TANAKH. The Hebrew name for the entire Hebrew Bible (Old Testament). It is an acronym formed from the initial letters of the titles of each of its three major divisions: TORAH ("Law"), NEBIIM ("Prophets"), and KETUBIM ("Writings").

TANHUMETH (PERSON) [Heb *tanḥumet* (תַּנְחֻמֶת)]. A Netophathite, the father of Seraiah who was one of the captains of the Judean forces who join Gedaliah at Mizpeh following the fall of Jerusalem.

Tanhumeth is mentioned in biblical texts only in Jer 40:8 and 2 Kgs 25:23 in connection with the association of his son, Seraiah, with Gedaliah. In contrast to 2 Kgs 25:23 where Tanhumeth is definitely identified as a Netophathite ("Seraiah son of Tanhumeth the Netophathite"), Jer 40:8 reads "Seraiah the son of Tanhumeth, the sons of Ephai the Netophathite." This identifies Ephai, and not Tanhumeth, as a Netophathite. The location of Netophah is not certain, though it is usually thought to be in the vicinity of Bethlehem. Khirbet Bedd Faluh (M.R. 171119), three miles S of Bethlehem, has been proposed (Gray *Kings* OTL, 771).

JOHN M. BRACKE

TANIS (PLACE) [Gk *Tanis* (Τανις)]. See ZOAN.

TANNA, TANNAIM. Rabbinic sages and scriptural reciters. The name comes from Aram *tannā᾽*, pl. *tănnā᾽îm* from the root *tny*. This term has, by derivation, two basic meanings in the rabbinic tradition. First, it refers to sages of the Mishnaic period. On that account, this period and its texts are termed "tannaitic." Tannaim flourished somewhat before but especially in the century and a half following the destruction of the Jerusalem temple in 70 C.E. Tannaitic rabbanism was a Palestinian movement, but some tannaim were active also in Babylonia (Neusner 1962). The period is customarily divided into five or six generations, with the most prominent tannaim including Akiba, Eliezer ben Hyrcanus, Meir, and Judah Hanasi. Tannaitic traditions are recorded in the Mishnah, the Tosefta, the midrashei halakha, and talmudic baraitot.

Second, the term can refer to the professional repeaters or reciters of the rabbinic schools. Publication during the tannaitic and amoraic periods was oral and depended, therefore, on tannaim who were, for all practical purposes, "living books" (Lieberman 1950: 83–99). Though some written records were kept, these bore no official status. Instead, when the version of a teaching needed to be checked it was the tannaim who were consulted. Accordingly, they were valued for their capacity to memorize, not for their intelligence. Nevertheless, some of the greatest talmudic sages also acted as tannaim for their teachers.

The form of rabbinic traditions reflects the centrality of the oral tannaitic system. Neusner (1985) has shown that the Mishnah employs a very limited number of mnemonic patterns in its composition. The same is true, to a significant extent, of amoraic traditions (Kraemer 1984: 47–148).

DAVID KRAEMER

TAPHATH (PERSON) [Heb *ṭāpat* (טָפַת)]. Daughter of Solomon, wife of Ben-abinadab (1 Kgs 4:11). Taphath is one of two wives mentioned in the list of Solomon's officers (1 Kgs 4:7–19). Her husband, Ben-abinadab, was in charge of Naphath-dor, the fourth district in the list. Only two daughters of Solomon are mentioned in the OT—Taphath and Basemath (1 Kgs 4:15). Both are wives of officials responsible for monthly provisions for the royal table. The inclusion of their names (along with the epithet, "daughter of Solomon") distinguishes their husbands from the other officials in the list and is usually interpreted as indicating their husbands' importance.

LINDA S. SCHEARING

TAPPUAH (PERSON) [Heb *tappūaḥ* (תַּפֻּחַ)]. A son of Hebron and a descendant of Caleb (1 Chr 2:43). Some (e.g., Noth *IPN*, 260) see in Tappuah a tribal or family name. The name is presumably to be connected either with Beth-Tappuah (Josh 15:53), modern Taffûḥ (M.R. 154105)—a town over 4 miles W of Hebron in the Judahite hill country—or with Tappuah (v 34), possibly modern Beit Natif (M.R. 149122)—a town in the lowlands of Judah, 12 miles W of Bethlehem. The term *tappûaḥ* means basically "apple, apple tree," but may also have a broader sense. The formula, "x the father of y," in which y is a place name, occurs first in 1 Chr 2:42 and appears often in the subsequent context. The feature looks

striking in its frequency here and its absence from the rest of the OT (Williamson *1 and 2 Chronicles* NCBC, 54). If, as has been suggested, *wbny ḥbrwn* ought to be deleted at the beginning of v 43, then Tappuah and his brothers would have been sons of Mareshah (known otherwise from Josh 15:44 as a chief city in the Shephelah, modern Tell Ṣandaḥannah [M.R. 140111], some 12 miles NW of Hebron). In spite of the textual problems, however, this seems quite unnecessary. The reader may consult the NIV, the NJB, and the RSV to discover other ways of handling these verses. See also TAPPUAH (PLACE).
EDWIN C. HOSTETTER

TAPPUAH (PLACE) [Heb *tappûaḥ* (תַּפּוּחַ)]. **1.** A town situated in the N Shephelah, or lowlands, of Judah (Josh 15:34), in the same district as Eshtaol, Socoh, and Azekah. This settlement is listed among the towns within the tribal allotment of Judah (Josh 15:21–62). The theory that this list is derived from an administrative roster compiled under the Judean monarchy (Alt 1925) has been widely accepted, although controversy continues over the precise makeup of the districts, the proper context of the town lists of Benjamin and Dan, and the period of the monarchy to which the original roster belongs (Boling and Wright *Joshua* AB, 64–72). Beit Natif (M.R. 149122), a modern village in the Shephelah S of the Nahal Sorek, has sometimes been suggested as a possible candidate (*IDB* 4: 517). See also TAPPUAH (PERSON). While this suggestion fits the geographical requirements, it lacks the necessary archaeological support.

2. A town in the hill country of Samaria on the N border of the territory assigned to the tribe of Ephraim (Josh 16:8). In the delineation of the S border of Manasseh we are informed that, although the city of Tappuah belonged to Ephraim, both the land of Tappuah as well as the inhabitants of En-Tappuah belonged to Manasseh (Josh 17:7–8). Alt (*KlSchr* 1: 193–202) has persuasively argued that the border lists of Joshua 15–19 are derived from ancient documents delineating the territorial claims of the tribes during the period of the Judges. This N Tappuah is probably the same as the Canaanite city whose king is said to have been defeated by Joshua and the people of Israel (Josh 12:17). Although the identification is not certain, Sheikh Abu Zarad, located high on a ridge approximately 12 km S of Nablus (M.R. 172168), is a popular and very attractive candidate for Ephraimite Tappuah (*LBHG,* 384).

3. According to the RSV, a town in Samaria near Tirzah which was destroyed by Menahem after its people refused to open to him (2 Kgs 2:16). Although the MT reads *tipsah,* the editors of the RSV chose to follow the LXX reading *taphoe,* suggesting that the MT is in error. If this emendation is accepted, then an equation with Ephraimite Tappuah may be possible. However, if we accept the common identification of Tirzah with Tell el-Fara, which lies approximately 22 km NE of Sheikh Abu Zarad, it is difficult to see how Tappuah of Ephraim can be considered to be within the territory of Tirzah (2 Kgs 2:16). Perhaps the MT reading is to be preferred in this case.

WADE R. KOTTER

TARALAH (PLACE) [Heb *tar·ălâ* (תַּרְאֲלָה)]. A town in the tribal allotment of Benjamin (Josh 18:27) which was in the hill country NW of Jerusalem. According to Alt (1925), the S town list, of which Taralah is a part, is an older document incorporated by the Deuteronomist into his history, i.e., the province list of the kingdom of Judah from the time of Josiah. Abel (*GP* 2: 92, 480) gives a possible identification for Taralah as Khirbet Erha, which is below er-Ram to the S, and contained a small village inhabited during the Iron Age (the Israelite period). Press (1948–55) has suggested Khirbet Tililiya, which is to the E of Bet Iksa. The exact location of Taralah, however, remains a mystery.

TAREA (PERSON) [Heb *taʿrēaʿ* (תַּאְרֵעַ)]. Var. TAHREA. A Benjaminite, son of Micah, great-great-grandson of King Saul according to 1 Chr 8:35. In the parallel genealogy in 9:41, his name appears as Tahrea *(taḥrēaʿ).* An etymology for either form of the name from Hebrew is unknown, and none of the etymologies proposed from other languages (e.g. Marquart 1902: 350, n. 17 or Rudolph *Chronikbücher* 80) is compelling. The variation between the two forms of the names reflects variation between the gutturals *ʾalep* and *ḥet,* which is attested to elsewhere in Hebrew, especially in the early postbiblical period (Kutscher 1959: 399). The section that lists Micah's children is segmented, listing four children; it is unclear why this segmented note appears in what is generally a linear genealogy. Tarea's line is not the main line, which derives instead from his brother Ahaz. The name appears in the two nearly identical genealogies of Saul's family in 1 Chr 8:33–40 and 1 Chr 9:39–44. This list is from the end of the First Temple period (Demsky 1971: 20), and was preserved by Benjaminite families that survived the Babylonian exile (Williamson 1979: 356). The existence and preservation of the Saulide genealogy probably reflects the continued prominence of Saul's family, and perhaps even their hope that they would return to power (Ackroyd *Chronicles, Ezra, Nehemiah* TBC, 42; Flanagan 1982: 25). See MELECH. On the repetition of the genealogy in 1 Chr 8 and 9, and its structure within the genealogies in Chronicles, see AHAZ.

D. Origin and Context

———

A. Terminology

In biblical studies a "Targum" is an early Jewish translation of the Bible into Aramaic. The noun *targûm* derives from the quadriliteral root *trgm* which appears early in the Semitic languages (cf. Akkadian *targummanu,* "translator"), and which may have entered Semitic from Indo-European, possibly via Hittite (Rabin 1963: 134–36). The root was primarily used in situations of trade, diplomacy, or administration which called for translation from one language into another, and it is to this context that its one biblical occurrence, Ezra 4:7, relates. The passage is difficult, but the correct interpretation probably is: "the document was written in Aramaic and was to be translated *(ûmĕturgām),"* that is into Persian when it was presented to the king at court; cf. Ezra 4:18, "the document which you sent us has been read in translation (Aram *mĕpāraš*) before me" (Lewy 1954: 175–77).

In rabbinic Hebrew the verb *tirgēm* is used in a restricted sense for translating the Bible from Hebrew into another language, usually Aramaic, but sometimes also Greek (see *y. Qidd.* 59a and *y.Meg.* 71c, where the reference is to Aquila's Greek version). So too, while the noun *targûm* could designate a Bible

translation into any language (*m. Meg.* 2:1; *b. Šabb.* 115a), it normally denotes the Aramaic version used to render orally the Bible lections in synagogue. The synagogue Bible translator was known as the *mĕtûrgĕmān, tûrgĕmān,* or simply as *hammĕtûrgēm* ("he who translates").

Besides its basic sense of "translate," the verb *tirgēm* in rabbinic Hebrew can also mean "to explain" a biblical verse or a mishnah, where the language of the explanation is the same as the language of the original text (Bacher 1905: Pt. II, 242). These two meanings may be illustrated from the Targumim themselves: Neofiti and Pseudo-Jonathan to Gen 42:23 both state that when Joseph feigned ignorance of Hebrew he spoke to his brothers through a *mĕtûrgĕmān* ("translator"); whereas Neofiti to Exod 7:1 calls Aaron the *mĕtûrgĕmān* of Moses when he acted as Moses' spokesman to Pharaoh and the Israelites (cf. *Exod. R.* 8:3). The root *trgm,* then, like Gk *hermēneuō,* Lat *interpretor,* and English "interpret," covered both "translation" and "explanation."

B. Texts

Targumim are extant for all the books of the Hebrew Bible except Ezra, Nehemiah, and Daniel.

1. The Pentateuch. a. Onqelos. At least since the Middle Ages, *Targum Onqelos* (= *Onq.*) has been widely accepted by Jews as the most authoritative Targum to the Pentateuch. The name derives from *b. Meg.* 3a: "R. Jeremiah (or some say R. Ḥiyya b. Abba) said: The Targum of the Pentateuch was composed by Onqelos the proselyte from the mouth of R. Eliezer and R. Joshua." This tradition is problematic since the parallel in *y. Meg.* 71c speaks of "Aqilas" rather than "Onqelos," and clearly envisages not an *Aramaic* but a *Greek* version of the Pentateuch (the well-known translation of Aquila). Given that "Onqelos" as a corruption of the Latin name "Aquila" is attested elsewhere in rabbinic texts (cf. *t. Dem.* 6:13 with *y. Dem.* 25d), two proposals can be made to resolve the conflict between these two passages. (1) Silverstone (1931) argued that both are correct and that the same man, Aquila, produced both a Greek *and* an Aramaic version of the Pentateuch. To support this argument he suggested that there are significant similarities between the Greek translation of Aquila and *Targum Onqelos.* (2) Alternatively, and more plausibly, Barthélemy (1963: 148–56) argued that the Babylonian tradition is mistaken: the Babylonians simply misunderstood a logion they received from the West and applied it erroneously to an anonymous Aramaic version which was circulating among them.

There is no doubt that *Onq.* was known in Babylonia in the Talmudic era and was held in high esteem there. The Babylonian Talmud refers to it as "our Targum" (*b. Qidd.* 49a), and quotes it some 17 times, usually under the rubric, "as we translate" (e.g. *b. Sanh.* 106b). It cites *Onq.* from time to time as an authority on halakah (legal ruling), and in general *Onq.*'s halakah agrees with the Mishnah, as the Mishnah was understood in the Babylonian schools. Though *Onq.* is in a different dialect from the Babylonian Talmud, its language at certain points (notably in vocalization) shows the influence of eastern Aramaic. The Masorah to *Onq.* was apparently produced in Babylon and includes a list of cases where the readings of the school of Nehardea differs from those of the school of Sura. All of this, coupled with the fact that no clear quotations from *Onq.* have yet been identified in the Jerusalem Talmud or the early midrashim, would seem to point to Babylonia as *Onq.*'s place of origin (Kahle 1959; Díez Macho 1973).

However, there are good grounds for believing that *Onq.* in fact originated in Palestine. (1) Although the most literal of the Pentateuchal Targumim, *Onq.* still contains considerable quantities of aggada (homily), often in an abbreviated and allusive form (Vermes 1975: 127–38; Bowker 1967; Melamed 1978, Vol. 1: 150–280). This aggada is usually attested in Palestinian sources, and, indeed, can often be found more fully and clearly expressed in the corresponding passages of the Palestinian Targumim. *Onq.,* for the most part, represents a distinctively Palestinian tradition of exegesis similar to that found in the Palestinian Targumim. (2) The western elements in the dialect of *Onq.* are much stronger than the eastern, and extend beyond the vocalization deep into the grammar and vocabulary. *Onq.*'s Aramaic is very similar to that of the *Genesis Apocryphon* from Qumran (Kutscher 1965: 9–11). Basically *Onq.* is written in a literary *koinē,* for which the name "Standard Literary Aramaic" has been proposed (Greenfield 1974), which was in use among Jews in the late Second Temple period. Though, as the name implies, Standard Literary Aramaic was not a localized vernacular, *Onq.*'s use of the dialect is strongly colored by *western* features. The fact that Standard Literary Aramaic was increasingly supplanted for literary purposes after the Bar

Kokhba war by the local western spoken Aramaic dialects (found in the Palestinian Targumim and in the Palestinian Talmud) strongly suggests that *Onq.* originated in Palestine in the 1st or early 2d centuries C.E.

This early Palestinian version of *Onq.* (= proto-*Onq.*) was taken to Babylonia, where it became the official Targum. It is probable the Babylonians did more than simply transmit the text they had received from the West: they subjected it to thorough revision. This revision was aimed at shortening the more expansive proto-*Onq.* into closer conformity to the underlying Hebrew (hence *Onq.*'s truncated, allusive aggadot), and at producing a standard text. The Babylonians created a Masorah for the Targum (Faur 1966) and imposed upon it their own tradition of vocalization. The Babylonian redaction of *Onq.* probably took place in the 4th or 5th centuries C.E. The argument that it must be dated before 259 C.E. because the Masorah to *Onq.* contains readings of the school of Nehardea which was destroyed in that year, is unsafe: the name "Nehardea" was applied to the successor school of Pumbeditha down to the Middle Ages. Though the text of *Onq.* is very stable, compared to that of the Palestinian Targumim, it is by no means uniform. Sperber (1973: 3–5) drew attention to doublets within the textual tradition of *Onq.* (and *Tg. Jonathan* to the Prophets) and argued that they pointed to the existence of two "schools of translators." The Babylonian recension of *Onq.* appears to be best represented by certain Yemenite mss with supralinear pointing, e.g. mss 131 (EMC 952), 133a (ENA 1705), 152 (ENA 80), and 153 (EMC 48) of the Jewish Theological Seminary of America, and Ms. Ebr. 448 of the Vatican Library.

As the Babylonian Gaonate increased in influence in the early Middle Ages the Babylonian *Onq.* was carried back to the West. Possibly the earliest reference to it in Western literature is *Pirqê dĕRabbî Eliezer* 38 (8th/9th cent. C.E.). Its return to its place of origin had a profound effect on the development of the indigenous Palestinian Targumim. It is premature to assume that *Onq.* had entirely disappeared from Palestine between, say, the 2d and the 8th cent. C.E., despite the lack of clear references to it in Tannaitic and Amoraic literature. There are certain mss and early printed editions of *Onq.* with Tiberian vocalization which have a much more Palestinian character than the standard Babylonian recension (note, e.g., the aberrant text partially published by Jahn in 1800). These texts may simply represent late contamination of the Babylonian *Onq.* resulting from its being copied in the West by scribes who knew the Palestinian Targumim. However, the possibility cannot at this stage be ruled out that some may be forms of *Onq.* predating the arrival of the Babylonian recension in the West, and are direct Palestinian descendants of proto-*Onq.* It is also possible that the *Onq.* element in Pseudo-Jonathan preserves traces of a Palestinian form of *Onq.*

b. Pseudo-Jonathan. By publishing it as "Targum Jonathan ben Uzziel to the Torah," the *editio princeps* attributed this work to the supposed author of the "official" Targum to the Prophets. However, since Zunz (1892: 71) it has generally been accepted that the title is a misnomer which arose from the false resolution of the abbreviation T"Y as *Targûm Yĕhônātān* instead of *Targûm Yĕrûšalmî.* References to a "Targum Jonathan to the Torah" can be traced back no earlier that the 14th-century Italian Qabbalist Menaḥem Recanati. The work is fundamentally a Palestinian Targum, and its correct medieval designation was *"Targûm Yĕrûšalmî*"or *"Targûm ʾEreṣ Yiśrāʾēl."*Although in modern scholarly literature it is frequently referred to as *"Targûm Yĕrûšalmî* I" [= TY I/TJ I] in contrast to *"Targûm Yĕrûšalmî* II" [= TY II/TJ II], which denotes the remaining recensions of the Palestinian Targum, the title "Pseudo-Jonathan" is perhaps to be preferred as being less tendentious and confusing.

Two text witnesses for *Targum Pseudo-Jonathan* (= *Ps.-J.*) are extant: the *editio princeps*, which was prepared for the press by Asher Forins and appeared on Venice in 1591; and Ms Add. 27,031 of the British Library, London. This Italian ms has no colophon, but belongs to the 16th century. The censor Dominico Gierosolimitano has signed and dated it 1598. The ms, though textually very close to the printed edition, is not its exemplar. The Targum covers the whole of the Pentateuch, except for a few verses (the identical verses being missing in both text-witnesses).

Ps.-J. is the most expansive of the Pentateuchal Targumim, and is roughly twice the length of the original Hebrew text. It is a highly complex document which combines traditions from widely different periods. Alleged "late" elements include references to the six orders of the Mishnah (Exod 26:9; 36:16), to the 613 commandments (Exod 24:12), to a wife and daughter of Muḥammad (Gen 21:21), to

Constantinople and Rome (Num 24:19–24), to "Edom" and "Ishmael" as representatives respectively of Christendom and of the Islamic world. None of these examples of lateness is as decisive as is sometimes supposed. For example, the 613 commandments are already mentioned in the Talmuds (*y. Šeqal.* 25a and *b. Makk.* 23b). And the "little apocalypse" in *Ps.-J.* Num 24:19–24 which refers to Constantinople and Rome, while it undoubtedly recalls early medieval apocalyptic texts such as the *Book of Zerubbabel* and the *Prayer of R. Simeon b. Yoḥai*, basically belongs to a genre of literature which goes back in Judaism to the Second Temple period. A similar passage in *Targum Lamentations* 4:21–22 speaks of the "Parthians" *(Parkĕwāʾē)* devastating Rome, which *prima facie* suggests a tradition originating before 224 C.E., when the Parthian empire came to an end. However, despite these caveats, there is a consensus that *Ps.-J.*, in the form in which it now stands, cannot have been redacted before the 7th/8th cent. C.E.

Counterbalancing the "late" elements in *Ps.-J.* are elements which appear to be "early." Among these the invocation against the "enemies of Yoḥanan the high priest" (Deut 33:11) has engendered considerable discussion. There is little doubt that "Yoḥanan"here is John Hyrcanus (134–104 B.C.E.), but whether the tradition itself, or the Targum at this point, goes back to the Second Temple period is much less certain. In Talmudic and post-Talmudic times there was some interest in the Hasmonaeans, as the *Scroll of Antiochus* and the *Book of Josippon* show (cf. also *b. Roš Haš.* 18b: "In the year so-and-so of Yoḥanan, high priest of the most high God"). More convincing evidence for an early component in *Ps.-J.* is the fact that it contains a number of translations that are expressly censured in rabbinic literature, sometimes as early as the Mishnah (Exod 12:8 in *y. Bik.* 65d; Lev 6:7 in *y. Bik.* 65d; Lev 18:21 in *m. Meg.* 3:10; Lev 22:28 in *y. Bik.* 9c; Deut 14:5 in *y. Kil.* 18c; Deut 26:4 in *y. Bik.* 65d) (McNamara 1966: 46–56, 134–38). These translations are scattered throughout the Targum and are part of its running text. It seems reasonable to conclude, therefore, that a stratum of *Ps.-J.* must have originated before the redaction of the Mishnah and the Yerushalmi Talmud. Further proof that *Ps.-J.* incorporates early material emerges from a number of detailed analyses of specific passages and themes, which, in the context of a thorough tradition history, show that *Ps.-J.*'s interpretation at times correlates with the earlier stages of the tradition (Vermes 1975: 92–126; Kuiper 1972; Schäfer 1971–72; 8–29; Alexander 1988: 243–47).

A major problem is *Ps.-J.*'s relationship to *Onq.* At numerous points *Ps.-J.* agrees with the text of *Onq.* to an extent that precludes accidental similarity. *Ps.-J.* regularly has doublets in which one element corresponds to *Onq.*, while the other appears to represent a Palestinian Targum (= PT) (see, e.g., Gen 3:5; 4:13; 8:11; 27:29; Exod 1:19; Lev 16:4; Num 26:9; Deut 5:3). The whole text of *Ps.-J.* can be resolved into three basic components: (1) PT material; (2) *Onq.* material; and (3) midrashic material unique to *Ps.-J.* (i.e., not found in *Onq.* or the other PT recensions), but often paralleled in *Pirqe R. El.* or other late rabbinic sources. There are two ways of accounting for *Ps.-J.*'s distinctive character. One is to suppose that *Ps.-J.* has attempted in a rather systematic way to combine a PT with *Onq.* This could have happened in Palestine in the early Middle Ages when the influence of the Babylonian *Onq.* was being felt in the West. In the interests of preserving *both* traditions a redactor created a text which effectively fused them. To this basic text he added, on his own account, a number of aggadot drawn from late midrashic sources. An alternative explanation would be to suppose that *Ps.-J.* and the Babylonian recension of *Onq.* are independently derived from a common source. If the Babylonian *Onq.* goes back to an old Palestinian Targum which originated before the Bar Kokhba war, then it is at least theoretically possible that *Ps.-J.* descends directly from that old Targum (it is a matter of nuance whether we designate *Ps.-J.*'s source "the old PT," or "proto-*Ps.-J.*" or "proto-*Onq.*"). This model would account for the puzzling fact that just as the PT element in *Ps.-J.* does not correspond precisely with the other extant recensions of the PT, so its *Onq.* element does not always correspond precisely with the extant witnesses of the Babylonian *Onq. Ps.-J.*, then, may preserve not only a distinctive recension of the PT (a fact generally acknowledged), but an independent Palestinian recension of the *Onq.* tradition as well. On this explanation *Ps.-J.* can be seen as the ultimate stage in the evolution of the PT, which in its latest strata betrays the influence of early medieval midrash.

c. Codex Neofiti 1. This Vatican Library ms, wrongly catalogued in 1892 as "Targum Onqelos," was identified in 1956 by Díez Macho as a recension of the Palestinian Targum to the Pentateuch. Its

Palestinian provenance, indicated clearly by the title inscribed on the first folio *(Targûm, Ḥumaš Yĕrûšalmî),* is confirmed by its affinities to the other recensions of the PT (notably the Fragmentary Targum and the Cairo Genizah fragments) and by its dialect, a form of Palestinian Jewish Aramaic close to the Galilean dialect of the Jerusalem Talmud. The main text, which is written in three different hands, contains a colophon stating that it was completed in Rome in (5)264 AM = 1504 C.E. Some 30 verses are missing, for a variety of reasons, and a further 150 contain lacunae or censor's excisions. Numerous glosses have been added by a variety of hands between the lines and in the margins. Though some of these are corrections of manifest scribal errors, the majority contain variant readings and indicate that the main text has on several occasions been collated with other Targum mss. The interlinear glosses, which are largely grammatical in character, often agree with *Onq.;* the marginal sometimes correspond to *Ps.-J.*, but mainly to Fragmentary Targum and to the Cairo Genizah fragments. Some appear to contain readings which are attested nowhere else (Clarke 1972; Lund and Foster 1977).

Widely different dates have been proposed for *Neof.*, ranging from "pre-Christian" times to the Renaissance. Goshen-Gottstein (1975) has presented the best case for a very late date. He argues that certain Targum texts may have been edited at the time of the Renaissance to purge them of midrashic expansions and to bring them into closer conformity with the underlying Hebrew, the literal, philological meaning of which was the main concern of Renaissance scholarship. This editorial activity may have produced the so-called "Third Targum" to Esther. Very late editorial activity on the Targumim should not be ruled out, but it cannot totally explain the phenomenon of *Neof.* Though *Neof.* is not as expansive as *Ps.-J.*, it is still an expansive Targum, and at numerous points the "editors" missed an obvious opportunity to excise midrashic additions. Moreover, as Speier (1966–67; 1969–70) has shown, *Neof.* agrees with PT quotations in the *ʿArûk* of Nathan ben Yeḥiel of Rome (died 1106) where these cannot be paralleled in other recensions of the PT, so there is evidence for the existence of *Neof.* well before the Renaissance. By way of contrast, Díez Macho (1959) has presented the case for a "pre-Christian" origin for *Neof.* He has argued, e.g., that certain "anti-Mishnaic" halakot in *Neof.* must be "pre-Mishnaic," and he has detected at various points in *Neof.* a non-Masoretic *Vorlage.* Díez Macho's arguments are far from conclusive, though he, and others, have successfully shown that *Neof.* appears to contain early material. In fact, there is no reason why, in principle, Díez Macho *and* Goshen-Gottstein cannot both basically be right. The literary character of *Neof.* is similar to that of *Ps.-J.:* it is a text which has evolved over a very long period of time. Analysis suggests that underlying *Neof.* is a base text which applies certain standard exegetical procedures and employs certain standard equivalents for the original Hebrew, but that this text has been glossed and reworked over a considerable period of time. Sometimes several layers of glosses can ble differentiated with reasonable certainty (Levy 1986). Though there is evidence of "post-Mishnaic" editing of *Neof.* (e.g., it tries to reflect the Rabbinic rules regarding the Forbidden Targumim), it is not marked by any of the very late elements that feature in *Ps.-J.* It probably represents on the whole an older recension of PT than *Ps.-J.* There are no good grounds for dating anything in *Neof.* later than the 3d/4th cent. C.E.

d. Fragmentary Targum. The texts belonging to the Fragmentary Targum (= FT) fall into at least five groups (Klein 1980): (1) Ms.P = Hébr. 110, Bibliothèque Nationale, Paris (589 verses of the Pentateuch). (2) Ms.V = Ebr. 440, Vatican Library (908 verses);Ms.L = B.H. fol.1, Universitätsbibliothek, Leipzig (293 verses); Ms.N = Solger 2,2°, Stadtbibliothek, Nürnberg (833 verses)—the exemplar for the *editio princeps* in Bomberg's *Biblia Rabbinica,* Venice 1516–17. To this group belong also Ms.M = Ms 3 of the Günzburg Collection, Moscow (probably copied from N) and Ms.S = Ms 264 of the Sassoon Collection (probably copied from Bomberg), which has supralinear vocalization. (3) Ms.B = Or. 10794, British Library, London (Deut 1:1–5:9). (4) Ms.C = T-S AS 72.75, 76, 77, University Library, Cambridge (Deut 23:15–28:5; 32:35–33:9). (5) Ms.J = Ms 605 (ENA 2587), Jewish Theological Seminary of America, New York (Exod 14:1, 13, 14, 29–31; 15:1–2; 17:15–16; 19:1–8). The manuscripts differ greatly in content, and even where they overlap display numerous variant readings. It is not possible to derive the five groups stemmatically from a common archetype. Nevertheless, they share certain characteristics which suggest that they are interrelated and form a distinct type of Targum. All the mss give a Palestinian Targum in western Aramaic. The incompleteness of FT is, apparently, deliberate, and not due to accidents

of transmission, as is the case with the Cairo Genizah Fragments. FT represents a broadly uniform tradition of Bible exegesis, and typologically stands somewhere between *Neof.* and *Ps.-J.* The major differences between the mss relate to length. They can partly be reconciled by observing that for the most part (though not invariably; Ms.B is idiosyncratic) the longer forms of FT contain the verses found in the shorter forms. Some shorter forms may, therefore, be abbreviations of the longer, and may result from a further application of the principle which created FT in the first place, viz., the desire to produce—for whatever reason—a Targum which covered only selected verses of the Pentateuch.

It is usually argued that FT-texts have been excerpted from originally complete Palestinian Targumim. (Shinan [1979: 108–10] less plausibly supposes that the FT-texts are the seeds from which the full Palestinian Targumim eventually grew.) But why should anyone create a truncated Targum? Though FT may represent a set of random Palestinian glosses derived from a variety of sources, a more satisfactory explanation is to suppose that, like the Targumic Toseftot (see below), it arose at a time when *Onq.* was establishing itself in the West as the "official" Targum, and displacing the indigenous Palestinian Targumim. Rather than simply discard the PT, certain scribes collated against *Onq.* a number of rather similar versions of the PT (not identical to any of the extant full recensions), and so created shortened forms of the PT to supplement *Onq.* These incomplete Targums recorded those elements of the complete text which were considered most worthy of preservation. Much of PT's aggada was preserved. It is noticeable that the sections of the Pentateuch missing from the longest recensions of FT are usually translated more or less literally in one of the other recensions of the PT, thus suggesting that they were literal also in FT's exemplars. However, the desire to preserve PT's aggada cannot have been the only motive, for there is a small but significant proportion of FT which offers a more or less "literal" version of the original. The precise reasons for preserving these "literal" renderings in tandem with *Onq.* probably varies from case to case. The selection may sometimes have been governed by subjective considerations no longer recoverable. In general, however, the phenomenon should be seen within the broad setting of medieval Jewish scholarly activity (well documented in *Neof.* and in *Targum Job*) which was prepared to record even minor variations between one Targum text and another. It is not possible to put any kind of precise date on FT, but it probably represents a recension or recensions of the PT earlier than *Ps.-J.* but later than *Neof.*

e. Cairo Genizah Fragments. Seven fragmentary copies of Pentateuchal Targumim—mss A, B, C, D, E, G, X in Klein's nomenclature (1986: XXII)—have been published from the Cairo Genizah collections. B, C, D give the Hebrew verse in full; A, E, H, Z quote only lemmata. It is not certain how extensive the original texts were. D, which preserves parts of Genesis, Exodus, and Deuteronomy, presumably once covered the whole of the Pentateuch. B, C, E, H, Z contain fragments of Genesis, and A contains fragments of Exodus. According to Beit Arié the dates of the mss range from 8th to 14th century (Klein 1986: XXXVII), which makes them among the earliest witnesses to the Targum. They are particularly valuable from a linguistic point of view since they represent a relatively pure dialect of Palestinian Jewish Aramaic (Kutscher 1976: 3–4). They are typical PT texts, alternating aggadic passages with literal translation. They do not agree precisely with any of the other extant PT recensions, nor with each other, where they overlap.

f. Toseftot. In certain mss of *Onq.*, sometimes in the text (Ms. Parma 3218), sometimes in the margin (Ms. Sassoon 282), sometimes gathered together at the end of a biblical book (*Biblia Hebraica,* Lisbon 1491, end of Exodus), aggadic passages are to be found labelled "Tosefta" or "Tosefta Yerushalmi" (Sperber 1959: XVII–XVIII). Separate collections of such Toseftot are also extant (Ms. Heb.c.74, Bodleian Library, Oxford; Ms. T-S NS 184.81, Cambridge University Library: see Klein 1986, 1: XXVII). Most of the Toseftot, including those in the independent collections, are to greater or lesser degree linguistically mixed and contain elements of both the dialect of *Onq.* and of the PT. The most plausible explanation of the Toseftot is that they are extracts from complete copies of the PT made after *Onq.* had become the standard Targum in the West. They illustrate the concern to preserve Palestinian aggadot and to embellish the drier, more literal style of *Onq.* An attempt was made (not always successfully) to recast them from their original PT dialect into the *Onq.* dialect, presumably in the

interests of stylistic uniformity. There is also another possibility, which, though less likely, may explain some cases. Given the history of *Onq.* outlined above, some Toseftot may represent the more expansive old Palestinian *Onq.* (proto-*Onq.*), before it was revised in Babylon to bring it into closer conformity to the Hebrew text. The Western features of the language could then be seen as secondary—the result of the transmission after ca. 200 C.E. of proto-*Onq.* in a linguistic milieu where western Aramaic dialects had become the norm.

2. The Prophets. a. Jonathan. *Targum Jonathan* (= *Jon.*) derives its name from *b. Meg.* 3a which states that "the Targum of the Prophets was composed by Jonathan b. Uzziel from the mouth of Haggai, Zechariah, and Malachi." Elsewhere Jonathan b. Uzziel is placed among the pupils of Hillel (*b. Sukk.* 28a; *b. B. Bat.* 134a; *ʾAbot R. Nat.* A14, 29a). Barthélemy (1963: 150ff) has suggested that the tradition in *b. Meg.* 3a, which is given in the name of two Palestinian authorities of the 3d century (R. Jeremiah and R. Ḥiyya b. Abba), originally referred to the Greek translation of Theodotion (= Jonathan). It was misapplied in Babylonia to an anonymous Aramaic version of the Prophets (cf. the Aquila/Onqelos problem discussed above). An alternative Babylonian tradition cites *Jon.* under the rubric "as Rab Joseph translates" (*b. Pesah* 68a = *Tg. Isa.* 5:17; *b. B. Bat.* 3b = *Tg. Obad.* 6; *b. Yoma* 32b = *Tg. Jer.* 46:20). Rab Joseph b. Ḥiyya (ca. 270–333 C.E.) was head of the Academy of Pumbeditha.

Jon.'s character and history are similar to *Onq.*'s. In grammar its Aramaic dialect is the same as *Onq.*'s (though there are curious differences in lexicon). As with *Onq.*, a great deal of aggada has been discreetly worked into *Jon.*, but it is generally not expansive. Any expansion that does occur tends to be found, as in *Onq.*, in poetic passages (see, e.g., Judges 5; 1 Sam 2:1–10). Since poetry forms a greater proportion of the Prophets than of the Pentateuch, the general complexion of *Jon.* appears slightly more aggadic than *Onq. Jon.*'s renderings are consistent across the whole second division of the canon, and stock phrases recur at different points where they fail to reflect precisely the underlying Hebrew (cf. e.g., *Tg. Jer.* 8:16 and *Tg. Hos.* 10:5, *Tg. Jer.* 8:21, 14:2, *Tg. Nah.* 2:11, and *Tg. Joel* 2:6; *Tg. Judg.* 20:16, *Tg. Jer.* 10:18 and *Tg. Zech.* 9:15). Parallel passages are rendered in the same way (cf. 2 Kings 18–20 and Isaiah 36–39; Isa 2:2–4 and Mic 4:1–4). There are links between *Jon.*'s rendering of the *hapṭārôt* and the corresponding Torah passages in *Onq.* (cf. Judg 5:8 and Deut 32:17; Judg 5:26 and Deut 22:5; 1 Sam 12:3 and Num 16:15; 2 Kgs 14:6 and Deut 22:5; Jer 48:45f and Num 21:45f). This would not be surprising if the suggestion is correct that the Targum of the Prophets grew from an Aramaic version of the *hapṭārôt,* which would naturally be influenced by the already extant renderings of the matching Torah lections.

Jon. was held as authoritative in Babylonia even in matters of halakah. The Babylonian Talmud introduces a number of quotations from it with the formula: "Were it not for the Targum of this verse we would not know what it means" (*b. Ber.* 28b; *b. Moʿed Qaṭ* 28b; *b. Meg.* 3a; *b. Sanh.* 94b). *Jon.*'s uniformity suggests that it was subjected at some point to an official redaction. From the Babylonian Talmud quotations of *Jon.* it may be deduced that this took place in Babylonia in the 4th/5th century C.E., at the same time as the Babylonian redaction of *Onq.* That Babylonian redaction is probably now best preserved in Yemenite mss with supralinear pointing such as Ms 229 (EMC 105), Jewish Theological Seminary of America, and Mss Or. 2210 and 2211, British Library, London.

Despite its Babylonian redaction, *Jon.* (like *Onq.*) originated in Palestine. This is indicated by its essentially Judean dialect (Tal 1975), and by its aggadot which have strong affinities with Palestinian tradition (Hayward 1987: 5). Attempts to show that it contains very early aggada (e.g., *Jon.*'s Messianic interpretation of Mic 5:1–3 must be pre-Christian [Díez Macho 1959: 226f]) are not always convincing. It is debated whether any remnants of the pre-Babylonian *Jon.* still survive. *Jon.* is extant in a number of Western mss with Tiberian pointing, and some of these (e.g. Codex Reuchlinianus of the Badische Landesbibliothek, Karlsruhe) differ significantly from the text in the Yemenite mss. It is unclear whether this Western recension represents a Palestinian phase of *Jon.* predating the Babylonian recension, or a case of the standard Babylonian recension being contaminated by the lost PT to the Prophets, subsequent to *Jon.* being brought (with *Onq.*) from Babylonia to the West.

b. Toseftot. Toseftot are extant for *Jon.* (just as they are for *Onq.*), sometimes written in the margins of the mss, sometimes inserted into the running text. Around 80 are found in Codex Reuchlinianus (Sperber

siglum f): note, e.g. the long aggadic addition relating to the Aqedah at Isa 33:7. They are also frequent in Ms p 116 of Jews' College, London (Sperber siglum c), and in the early edition of the Prophets printed at Leiria, 1494 (Sperber siglum d): see 1 Sam 17:39, 43; 18:19; 2 Sam 12:12; 1 Kgs 5:11; 22:21, 22; 2 Kgs 4:1, 6, 7 in Sperber's edition (1959). Qimḥi in his commentaries cites a number of these additions under the rubric "Targum of the Tosefta." In the mss, however, they are commonly designated "Targ[um] Yerush[almi]," or "Tosefta of the Land of Israel." It is very likely that the Toseftot to *Jon.* originated in the same way as the Toseftot to *Onq.* They are remnants of a once complete Palestinian Targum (or Targums) to the Prophets, which were preserved to supplement *Jon.* when the Babylonian recension of the latter began to predominate in the West. The surviving Toseftot appear to correspond with *hapṭārôt* for the Sabbath and festival lections. Many have been recast in the dialect of *Jon.*, but some have preserved a more PT Aramaic coloring.

3. The Writings. There is no official Targum of the Writings. According to *b. Meg.* 3a Jonathan b. Uzziel wanted to provide one, but was reqtrained by a heavenly voice because the date of the Messiah is foretold in the Writings. Medieval writers usually quote the Targumim of the Writings as "Targum Yerushalmi." The view that they originated in Palestine is, on the whole, borne out by their language and aggada. However, *Masseket Sōpĕrîm* 13:6 introduces *2 Tg. Esth.* 3:1 with the words "Rab Joseph translated." This is the same Rab Joseph b. Ḥiyya, head of the Academy of Pumbeditha, to whom certain Babylonian sources attributed the Targum to the Prophets. The Targumim of the Writings fall textually into two groups: (1) the Five Scrolls (Lamentations, Canticles, Ruth, Qohelet, Esther); and (2) Job, Psalms, Proverbs, and Chronicles. The Five Scrolls are extant in both Yemenite and Western mss, and in *Tg. Lam.* and *Tg. Cant.* the Yemenite mss present a quite different recension of the text from the Western. In *Tg. Ruth* and *Tg. Qoh* the distinction is not so clear. In *Tg. Esth.* the situation is totally confused. It is possible there was once a distinctive Yemenite recension of the Targum for each of the Five Scrolls, but in three of them (Ruth, Qohelet, and Esther) it has been contaminated to varying degrees at a fairly late date by the Western recension. In the Yemen, the Five Scrolls were read at five different festivals throughout the liturgical year—Canticles at Pesaḥ, Ruth at Šabu‹ot, Qohelet at Sukkot, Esther at Purim, and Lamentations at the 9th of Ab. Canticles, Ruth, and Qohelet are read with Targum. The link between Esther and Purim is, of course, very old, but it is debated how early the other Scrolls were associated with their festivals. The Talmud does not mention any connection. It is not unlikely, however, that in some cases the connection was early enough to have influenced the Targum. Note, e.g., how the Exodus is a major theme of *Tg. Cant. Tg. Job* and *Tg. Ps.* are very close. *Tg. Prov.* and *Tg. Chr.* stand on their own.

a. Job. Some 14 mss of *Targum Job* (= *Tg. Job*) are known, of which Ms Ee 5.9, University Library, Cambridge, is, perhaps, the best. All mss are of Western provenance and represent four different recensions of the text (Vallina 1980; Stec 1989). One of *Tg. Job*'s most distinctive features (affecting all its recensions to greater or lesser degree) is multiple translation: two, sometimes three or even four, different translations of a verse, or substantial part of a verse, are presented, under the rubric *targûm ›aḥēr* or *lāšôn ›aḥēr.* Approximately 50 verses are treated in this way. Bacher (1871) attributed the alternative Targumim to a glossator of *Tg. Job* living in the 8th or 9th cent. C.E., who, dissatisfied with the midrashic-aggadic renderings of certain verses, made more literal versions which he inserted into the text as the first Targum. He then recorded the original translation as *targûm ›aḥēr*. Thus Bacher explained the fact that the first Targum tends to be literal, and the second aggadic. But this hypothesis fails to explain why in some cases both first and second Targumim are more or less literal, or why numerous aggadic verses have been left untouched by the glossator. A more plausible solution is to suppose that *Tg. Job* as we now have it represents a series of scholarly "editions" which result from scribes collating various mss and recording the substantial variants. Such scholarly interest in collecting variant readings is attested elsewhere in the Targumim (e.g., *Neof.* 1). The four recensions and the multiple translations bear witness to the textual fluidity and complexity of *Tg. Job.* This complexity suggests that it evolved over a considerable period of time. Though textually unrelated to the Rabbinic Targum of Job, 11QTgJob from Qumran shows that translation of Job into Aramaic had begun already in Second Temple times. Also, *t. Šabb.* 13:2–3 (cf. Šabb. 15c; *b. Šabb.* 115a) records a story about Rabban Gamliel immuring a copy of a Targum of Job in

the 1st century C.E. There are a number of non-Masoretic readings implied in *Tg. Job* (e.g. 31:18; 33:17). They may point to the presence of an early stratum of material. Bacher (1871) suggested the *Tg. Job* originated in Palestine in the 4th or 5th cent. C.E., but this is little more than a guess. Linguistically *Tg. Job* is mixed: it has strong affinities to the language of PT to the Pentateuch, but it also contains elements of eastern Aramaic as well. For long sections it is literal (e.g., chaps. 19–23 and 32–33), but it does have a considerable number of expansions and non-literal renderings (e.g. 5:12–13; further Weiss 1979: 235–87).

b. Psalms. In language, style, exegesis, and textual type *Targum Psalms* (= *Tg. Ps*) is very similar to *Tg. Job:* both Targumim have gone through a parallel process of transmission and probably originated in the same milieu. Díez Merino (1982) has published a Spanish tradition of this Targum, represented by Ms.116–Z–40 of the Biblioteca de la Universidad Complutense, Madrid (= No.5 in the catalogue of Villa-Amil and Castro), which was prepared for use in the Complutensian Polyglot by Alfonso de Zamora, but no comprehensive critical edition is available. *Tg. Ps.*, however, is found in the same Western mss as *Tg. Job* (including Cambridge Ee. 5.9), and is likely to reflect the same four recensions. Multiple Targumim are less frequent (only some 21 verses in all are involved), but are more common in the mss than in the standard printed editions. Aggada is also less extensive, but tends to agree with Palestinian tradition. There are some notable cases of historicizing exegesis, where the words of the Psalm are contextualized in the sacred history (see e.g., Ps 9:6–7;91; 118)—a device used throughout the *Tg. Cant.* As with *Tg. Job*, the complexity of the textual tradition means that little can be said with certainty about the date of *Tg. Ps.* It does imply a non-Masoretic *Vorlage* at a number of points. For example, the Madrid ms translates MT's *ʾôr zāruʿ* in Ps 97:11 by *nĕhôr dĕnaḥ* ("light has shined") in agreement with LXX and Peshitta. (The reading of the Targum in Bomberg's edition—*nĕhôr dĕnaḥ ûmittamar* ["light has shined and is preserved"]—represents a secondary attempt to conform the Targum to MT.) Such non-Masoretic readings are a sign of early material. *Tg. Ps.* 22:1, *ʾēlî ʾēlî* [v 1. *ʾĕlāhî ʾelāhî*] *mĕṭûl mah šĕbaqtānî*, is close to Jesus' words on the cross (Mark 15:34; Matt 27:46) which some have claimed as evidence of a Targum of the Psalms in the 1st century C.E. But not too much should be made of this since both the Targum and the NT give the obvious Aramaic translation of the Hebrew. All that can safely be deduced from the reference to Rome and Constantinople in *Tg. Ps.* 108:11 is that the Targum of this verse cannot have arisen before Constantinople was founded as the capital of the Eastern Roman Empire. It should be noted, however, that some text-witnesses omit the reference to Constantinople.

c. Proverbs. *Targum Proverbs* (= *Tg. Prov.*), though commonly grouped with *Tg. Job* and *Tg. Ps.*, differs from these Targumim in two significant ways. First, it is almost totally literal, and avoids midrashic interpretation even when such interpretation might reasonably be expected: e.g., in 8:22ff. it makes no attempt to exploit the rich Rabbinic traditions which identify wisdom with Torah and which give Torah a role in the creation of the world (see FT Gen 1:1; *Gen. R.* 1:1; further Komlosh 1973: 72). None of the Rabbinic exegeses of Proverbs collected in Midrash Proverbs is reflected anywhere in *Tg. Prov.* Second, in 300 verses out of 915 *Tg. Prov.* is verbally identical to Peshitta Proverbs, and on a number of occasions it agrees with the Peshitta against the MT (e.g., 1:7; 4:26; 5:9; 7:22–23; 9:11; 12:19; 16:4, 25), though it should also be noted that there are instances where it agrees with MT *against the Peshitta* (Maybaum 1871: 89 fn). The Aramaic of *Tg. Prov.* is a curious mixed dialect: e.g., it has the 3d masc. sing./plur. impf. of the verb with prefixed /*n*/ (as in Syriac and Babylonian Jewish Aramaic) and with prefixed /*y*/ (as in *Onq.* and PT dialects) (see 9:11). Some of its linguistic features, such as *gyr* instead of *ʾry/ʾrwm* (29:19), appear to be clear "Syriacisms."

Two main theories have been advanced to account for these facts: (1) *Tg. Prov.* is a reworking of the Peshitta Proverbs. In other parts of the Bible it is normally thought that significant agreement between Peshitta and Targum is evidence of the latter's influence on the former, not vice versa, but there is nothing intrinsically improbable in the suggestion that a Jewish scholar, wanting to create a Targum for Proverbs, saved himself some trouble by adapting and, rather inconsistently, revising a Christian Aramaic version. If this theory is correct, then *Tg. Prov.* is a late work, and its non–Masoretic readings have simply been taken over, presumably unnoticed, from the Peshitta. Its dialect is a totally artificial mixture of Jewish Aramaic and Syriac, created by patchy reworking of the Peshitta into more standard Targumic forms of

Aramaic. (2) According to the second theory, Peshitta Proverbs is derived from *Tg. Prov.*, or (more subtly) both Peshitta and Targum draw on a common earlier Jewish source. This theory, which follows the usual lines of influence between Targum and Peshitta, implies that *Tg. Prov.*, or the Ur-Targum that lies behind *Tg. Prov.* and the Peshitta, is a relatively early work based on a non-Masoretic *Vorlage.* The "Syriacisms" might be explained by supposing that *Tg. Prov.*, or the Ur-Targum, was composed somewhere in the East, perhaps for use in the Jewish community of Nisibis, or some other center in N Mesopotamia, where the local Aramaic dialect would have been close to classical Syriac. In transmission, however, the eastern Aramaic of this text was modified quite heavily, but unsystematically, to make it conform to "normal" Targumic Aramaic. *Tg. Prov.* is extant in most of the mss that contain *Tg. Job* and *Tg. Ps.* Until its textual tradition has been fully investigated and clarified there is no solid basis on which to decide between these competing theories.

d. Lamentations. Two recensions of *Targum Lamentations (Tg. Lam.)* are extant—one in the Yemenite mss (e.g., Or. 1476, Or. 2377 and Or. 2375, British Library, London), the other in the Western mss (e.g., Codex Urbinas 1 [= Urb.Ebr.1, Vatican Library] and Héb. 110, Bibliothèque Nationale, Paris). The Western recension is longer than the Yemenite, and usually gives a better text. However, the supralinear vowelling of the Yemenite mss (which derives from the Babylonian tradition of reading the text) is linguistically more coherent than the Tiberian vowelling of the Western manuscripts (van der Heide 1981; Alexander 1986). The two recensions are not self-contained: some of the later Yemenite mss appear to have been contaminated by the Western tradition. *Tg. Lam.* is very expansive, the aggadic additions tending to cluster toward the beginning of the work. It shares many exegetical traditions with *Lamentations Rabba,* which is generally regarded as one of the oldest of the midrashim, but it is hard to say whether *Tg. Lam.* drew on the midrash or vice versa. Linguistically *Tg. Lam.* is a mixture of PT and *Onq.* Aramaic: *ḥzˀ* (= *Onq.*) occurs 19 times as against 4 occurrences of *ḥmˀ* (= PT). *Tg. Lam.* 4:21, "Rejoice and be glad, Constantinople, city of wicked Edom, that is built in the land of Armenia, with great crowds of the people of Edom," could hardly have been written before 330 C.E. when Constantinople became the capital of the Eastern Roman Empire. From an analysis of *Tg. Lam.* 4:21–22, Komlosh (1973: 90) dates the work to the early 7th century C.E., when Jews saw the Persians as potential deliverers from the yoke of Byzantium, but before the liberation of Jerusalem in 614.

e. Canticles. *Targum Canticles* (= *Tg. Cant.*) is a very expansive Targum (about five times the length of the original Hebrew), which systematically interprets Canticles as a cryptic account of the relationship between God and Israel from the Exodus to the Messianic Age: 1:3–3:6 covers the Exodus, Sinai, the wilderness wanderings and the entry into Canaan; 3:6–5:1 covers Solomon and the Temple; 5:2–6:12 covers the Exile under Sennacherib and Nebuchadnezzar, the return under Cyrus, the rebuilding of the Temple, the Great Assembly, and the Hasmonaeans; 7:1–13 is a miscellany of themes corresponding to the present age in the chronological schema. Exhortatory in tone, it urges Israel to repent and pray for the redemption; 7:14–8:14 depicts the Messianic Age: the coming of the Messiah, the resurrection, the return to Jerusalem, and the war against Gog and Magog. The basic exegetical technique of the Targum is to deduce from the direct speech in the original an appropriate context in the sacred history to which the words could apply, all within the basic equation of God as the "beloved" *(dôd),* and Israel as his "darling" *(raʿyâ).* The exegesis is historicizing, and not, strictly speaking, mystical, even at 5:10–16, a passage which may have influenced the *Šiʿûr Qômâ* speculations of the Merkabah mystics (Alexander 1989: 126).

Tg. Cant.'s unusually holistic reading of its text, its stylistic and exegetical uniformity, and the conspicuous lack of alternative Targumim, seem to point toward an original single author. However, textual considerations put this idea in some doubt. Textually *Tg. Cant.* is similar to *Tg. Lam.*, and exists in two distinct recensions—a Yemenite (e.g., Ms. Or. 1302, British Library, London, and Ms. Opp.Add. 2333, Bodleian Library, Oxford) and a Western (e.g., Codex Urbinas 1, Vatican Library, and Ms. 3189, Biblioteca Palatina, Parma)—which cannot be derived stemmatically from a single archetype. So if there was an original author his work has been modified quite heavily in transmission. *Tg. Cant.* is also linguistically similar to *Tg. Lam.* and contains elements both of PT and *Onq.* Aramaic. *Tg. Cant.* is usually regarded as a late Targum composed possibly in the 7th century C.E. At 1:2 and 5:10 it refers to

the "Six Orders of the Mishnah and the Talmud" as a completed text. At 1:7 it appears to envisage a world divided between "Esau" (= Christianity) and "Ishmael" (= Islam). At a number of points its language may be influenced by Arabic (note 1:7 *šittûp* = Arabic *širk;* 4:3 *min bar* = Arabic *baʿda;* further R. H. Melamed 1921: 395). It contains numerous indirect quotations from other parts of Scripture and these betray a knowledge of *Onq., Ps.-J.* and *Jon.* Its relationship to *Canticles Rabba* is unclear: both the midrash and the Targum share many traditions, but *Tg. Cant.* also has a number of striking aggadot not attested in the much fuller midrash. E. Z. Melamed's contention (1970–71) that *Tg. Cant.* makes use of (indeed, misquotes) traditions from the Babylonian Talmud has been contested by Heinemann (1971–72). Melamed (1970–71: 215) also suggests that the reference to "this polluted land" in *Tg. Cant.* 8:14, and the description of the rabbinical academy in 8:13, suggest the work was composed in Babylonia.

f. Ruth. *Targum Ruth* (= *Tg. Ruth*) is well attested both in Western mss (e.g. N.72, Biblioteca Angelica, Rome, and 3231, Biblioteca Palatina, Parma) and in Yemenite (e.g. Or. 2375 and Or. 9906, British Library, London), but the two groups do not represent such clear-cut recensions in Ruth as they do in *Tg. Lam.* and *Tg. Cant. Tg. Ruth* is moderately expansive and alternates blocks of aggadic material (e.g., 1:1, 13, 16–17; 2:10–13; 3:7–8, 10, 15; 4:20–22) with passages of more or less literal translation. Much of its aggada is found also in *Ruth Rabba* (cf. e.g., the list of ten famines at *Tg. Ruth* 1:1 with the similar list in *Ruth R.* 1:4). Little can be said with certainty about *Tg. Ruth*'s date. Levine (1973: 6–8) argues that it contains pre-Rabbinic halakah. The most striking case is at 1:17 where four kinds of death penalty are listed, viz., stoning, burning, the sword, and hanging on a tree *(ṣĕlîbat qĕsāʾ).* This contradicts the standard Rabbinic view (reflected in *m. Sanh.* 7:1) that the four death penalties are stoning, burning, beheading with a sword: cf. *m. Sanh.* 7:3), and strangulation (with a scarf [*sûdārîn*]: cf. *m. Sanh.* 7:3). According to Rabbinic halakah criminals who are stoned should be hung on a gibbet after they are dead, but hanging in itself is not regarded as a means of causing death (*m.Sanh.* 6:4). *Tg. Ruth* is clearly at odds with the Mishnah (a fact recognized by the Parma ms which reads *ḥĕnîqat sûdārāʾ* ["strangulation with a scarf"] for *ṣĕlîbat qêsāʾ*), and with the corresponding passage in *Ruth R.* (9:14 §8), which lists the four Mishnaic death penalties in the precise wording of the Mishnah. However, it is too simplistic to argue, as Levine does (1973: 7), following Díez Macho, that "anti-Mishnaic" halakah must be "pre-Mishnaic," and is evidence of the antiquity of the Targum. Certainly *Tg. Ruth*'s position that hanging is a mode of execution is attested as early as 11QTemple 64:7–13, but it represents an intrinsically plausible interpretation of Deut 21:22 which was apparently advocated by some Qaraites (who may, of course, have derived it from Second Temple Jewish sources). In its "anti-Mishnaic" halakah *Tg. Ruth* could be reflecting Qaraite halakah just as easily as "pre-Mishnaic" sectarian halakah.

g. Qohelet. As with *Tg. Ruth*, the Western and Yemenite mss of *Targum Qohelet* (= *Tg. Qoh.*) do not appear to present two clearly differentiated recensions of the text. *Tg. Qoh.* is moderately paraphrastic, and its aggada can usually be paralleled in *Qohelet Rabba*, the Babylonian Talmud, and other classical rabbinic sources, although sometimes with idiosyncratic variations. For example, *Tg. Qoh.* allegorically interprets the "little city" in 9:14f as the human body, the "great king" as the evil inclination, and the "poor wise man" as the good inclination. This interpretation is broadly similar to that found in *Qoh. R.* 9:14 § 8 and *b. Ned.* 32b. But the Targum works out the allegory with much greater detail and precision, and its view that the "few men" refer to the virtues of the heart contrasts with the midrash and the Talmud's view that the reference is to the limbs of the body.

h. Esther. Early printed editions offer three recensions of *Targum Esther* (= *Tg. Esth.*). *1 Tg. Esth.* and *2 Tg. Esth* both appeared in Bomberg's *Biblia Rabbinica*, Venice 1517, the former in the main text, the latter in an appendix entitled, "Targum Sheni" ("Second Targum") to Esther. These two Targumim are very expansive; *2 Tg. Esth*, in fact, is the most consistently expansive text in the whole of the Targumic corpus. In stark contrast the so-called "Third Targum" to Esther *(3 Tg. Esth.),* which was printed in the Antwerp Polyglot of 1569–72 (cf. Alfonso de Zamora's *Tg. Esth.* in Ms. 116–Z–40, Biblioteca de la Universidad Complutense, Madrid [= No. 5 in the catalogue of Villa-Amil and Castro], and in Ms. M–2, Biblioteca Universitaria, Salamanca) was almost completely literal. Goshen-Gottstein (1975) strongly suspects the authenticity of *3 Tg. Esth.* He argues that humanist scholars created it in the 16th century by

purging the expansive Esther Targums of their aggadic additions. Grelot (1975), however, accepts *3 Tg. Esth.* as genuine, with some reason, for, although scholars such as Alfonso de Zamora or Arias Montano (the editor of the Antwerp Polyglot) had the ability to produce such a Targum, creating *3 Tg. Esth.* would have been a tour de force, and it is puzzling that similar Targumim were not attempted for easier texts such as Lamentations. Grelot argues that *3 Tg. Esth.* is, in fact, the oldest recension of *Tg. Esth.* and forms the basis for *1 Tg. Esth.* The picture is complicated by the fact that Yemenite mss of *Tg. Esth.,* such as Or. 2375, British Library, London (Sperber 1968), do not respect the distinction between *1 Tg. Esth.* and *2 Tg. Esth* but combine elements from both recensions (Díez Merino 1984: 289). Indeed, even some Western mss do the same (e.g. Ms. Nürnberg = Kennicott no. 198, Ms. Sassoon 282, and Ms. Héb 110, Bibliothèque Nationale, Paris). *1 Tg. Esth.* and *2 Tg. Esth* contain many aggadot (the traditions regarding Solomon's Throne are a case in point) attested elsewhere only in late sources such as *Esther Rabba;* therefore the presumption must be that both these Targumim, in the form in which we now have them, date from the early Middle Ages. However, the public reading of Esther was a part of the festival of Purim at least from Tannaitic times (see *m. Meg.*), so there was good reason for rendering Esther into Aramaic at an early date. The immense complexity of the textual tradition of *Tg. Esth.* can be seen as a measure of the length of time that Esther had been read and studied in connection with Purim. It has yet to be proven, however, that early strata can be identified in the expansive *1 Tg. Esth.* and *2 Tg. Esth*., or that the literal *3 Tg. Esth.* takes us back to the earlier stages of the tradition.

i. Chronicles. *Targum Chronicles* (= *Tg. Chr.*) is for the most part a literal translation, with a few aggadic expansions (e.g., at 1 Chr 4:18; 7:21; 11:11, 22; 2 Chr 3:1; 23:11; 33:12–13). It is extant in three German mss of the 13th and 14th centuries, all with Tiberian vocalization: Ms.E = the Erfurt Codex (now Ms.or.fol. 1210 and 1211, Deutsche Staatsbibliothek, Berlin); Ms.C =Ms.Or.Ee.5.9, University Library, Cambridge; and Ms.V = Codex Urbinas 1 (Urb.Ebr.1, Vatican Library). These give two rather different recensions of the Targum, one represented by E, the others by C and V. In the parallel passages of Chronicles, Kings, and Samuel, *Tg. Chr.* shows strong affinities to the Targum of the Former Prophets, especially as found in Codex Reuchlinianus. *Tg. Chr.* may originally have been created by taking a Targum of the parallel passages in Kings and Samuel and extending its general style to the rest of Chronicles. However, *Tg. Chr.* seems to have made use, not of any extant recension of the Targum to the Former Prophets, but of an earlier form of that Targum which predated the emergence of the standard Babylonian recension. The similarities between *Tg. Chr.* and Peshitta Chronicles are also best explained by the hypothesis that Peshitta Chronicles is derived from an earlier form of the Targum than the one now extant. *Tg. Chr.* appears to have known and made use of PT to the Pentateuch. It is particularly close to *Ps.-J.* in its vocabulary, style of translation, and aggadic content (cf. *Tg. 1 Chr.* 1:4–24 with *Ps.-J.* Gen 10:1–32). Its language is mixed and contains elements of PT Aramaic, of *Onq.* Aramaic, and of Babylonian Talmud Aramaic. In this case the PT Aramaic stratum is probably original, and the other dialectal features secondary, having been introduced by scribes who knew well *Onq.* and the Babylonian Talmud. Le Déaut and Robert (1971), following Rosenberg and Kohler (1876), argue that *Tg. Chr.* originated in Palestine in the 4th century C.E., but that its final redaction may be as late as the 8th/9th cent. C.E. A late date for the text as we now have it is suggested by the fact that certain aggadot in *Tg. Chr.* seem to betray the influence of the Babylonian Talmud. It is hard to envisage such a knowledge or respect for the Babylonian Talmud in the West before the early Middle Ages.

C. Genre

Targum and midrash share the same hermeneutical approach and apply the same exegetical techniques to the interpretation of Scripture, but they differ in important ways as to their literary form and presentation. Targum is translation, and as such its form tries to mirror the form of the original text, its voice and perspective is supposed to be the same as that of the original author. Midrash, by way of contrast, has its own distinctive form of lemma + comment which never varies whatever the form of the original, and its voice and perspective is always explicitly that of the *daršān.* Targum, unlike midrash, can offer essentially only a monovalent reading of Scripture; it cannot be argumentative, nor make explicit its exegetical reasoning, nor quote other verses of Scripture with the formula, "as it is written" (though there

are numerous "concealed" quotations from Scripture in the Targum). Targum cannot cite rabbinic authorities by name, nor be selective: it must present the whole of the original in proper order.

It is true that the Targumim show certain formal similarities to midrash, which tend to be more marked the later the text. The hugh expansions found in some of the late Targumim (e.g., *Ps.-J., Tg. Cant., 2 Tg. Esth*) put the translation form under great strain, and would have been more easily accommodated by midrashic form. Moreover, the Targumim do achieve a degree of polyvalency in their readings of Scripture. They contain numerous double renderings of single biblical items: e.g. *Ps.-J.* translates the Hebrew *nĕśô ʾ* [RSV "bear"] in Gen 4:13 as both "tolerate" and "forgive": "my rebellion is far too great to be *tolerated*, yet before you is the power to *forgive* it." Sometimes these doublets have resulted from the incorporation of alternative translations from the margin into the text; sometimes they may be original. Either way they arguably involve an understanding of the Hebrew text as polyvalent. Polyvalency is also achieved, very directly, in those Targumim (e.g., *Tg. Job*) which offer multiple translations. The formula *targûm ʾaḥēr* used to introduce these variant translations seems deliberately to echo the formula *dābār ʾaḥēr* used in midrash to introduce alternative interpretations. The midrashic form of lemma + comment also has its analogies in Targum. Targum was intended to be read side by side with Scripture: Targum proper is arguably only part of a larger literary structure which includes the Bible. The biblical text therefore can be seen as the lemma, the Targum as the comment. Even within the Targum proper there is an analogy to lemma + comment. At many points in the Targum it is possible to distinguish a literal base-text from explanatory plusses: the base-text is equivalent to the lemma, the plus to the comment.

All these formal analogies between Targum and Midrash should be duly acknowledged, but they do not invalidate the assertion that Targum and Midrash are two different literary genres. The Targumim, even at their most expansive and midrashic, try to stay within the limits of the translation-genre as they understood it. It should be noted that Targum appears to treat all Scripture formally as narrative: it does not distinguish between Hebrew poetry and prose. It often expands the poetry in such a way that its poetic form is lost and it is reduced to prose in translation (Alexander 1988: 228–37).

The material that makes up the Targumim may be classified into two broad categories: (1) literal translation and (2) non-literal translation. Though all translation involves some interpretation, the degree of interpretation presented by literal (i.e., natural and obvious) translation may, for practical purposes, be rated at zero. In non-literal translation the interpretative element is introduced in three main ways: by addition, by substitution, and by rewriting (Samely 1989: 197–206). The addition may be an explanatory word, clause, or clauses attached to a literal base-translation: e.g., Gen 10:2: Hebrew, "The sons of Japhet were: Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras"; Targum *Ps.-J.*, "The sons of Japhet were: Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras, *and the names of their provinces were: Phrygia, Germania, Media, Macedonia, Bithynia, Asia, and Thrace.*" Care is always taken to link the addition seamlessly to the base-text, and to conform it to the overall syntax of the verse, so that it is usually impossible, without looking at the Hebrew, to distinguish base-text from addition. However, the addition is inserted in such a way that it can be "bracketed out" leaving behind a viable, freestanding, literal rendering of the Hebrew.

In substitution a biblical word or phrase is given only a non-literal equivalent: e.g., Num 34:4, Hebrew, "its goings out [i.e., of the border of the land] shall be south of Kadesh-barnea"; Targum *Ps.-J.*, "its goings out shall be south of *Reqem-Geʾah* [= Petra]." Here the non-literal rendering can be analysed as substituting the potentially literal rendering. The interpretative element cannot be bracketed out leaving a viable base-text. For that to have been possible the Targum would have had to read: "its goings out shall be south of Kadesh-barnea, that is Reqem-Geʾah."[w]

In rewriting the Targum creates essentially a new syntactic structure, rather different from the one that would have been created by literal translation, and inserts into it elements derived from the biblical text, usually in the order in which they appear in the original. These biblical elements may be translated literally or non-literally, or the non-literal equivalent may be related to the literal in some way, such as by using the formula, "X [= non-literal equivalent], which is likened to Y [= literal equivalent]." Rewriting, which is typical of the *Tg. Cant.*, may be illustrated by the following example: 1:11: Hebrew, "We will

make for you circlets of gold [*tôrê zāhāb*], with studs of silver [*něquddôt hakkāsep*]"; Targum: "Then it was said to Moses: Ascend to the firmament and *I will give you two tables of stone,* hewn from the sapphire of the throne of my glory, *gleaming like fine gold,* arranged in lines and written by my finger. *Engraved on them are the Ten Words, refined more than silver* that has been refined seven times seven ways (which corresponds to the number of interpretations by which they [the Ten Words] are expounded—49 modes of interpretation in all), And I will give them by your hand to the people, the House of Israel."

D. Origin and Context

In Talmudic times it was customary to translate the biblical lections in synagogue simultaneously from Hebrew into Aramaic (*m. Meg.* 4:4, 6; further Alexander 1985). Tradition traced the institution of this practice back to Ezra's public re-promulgation of the Law described in Nehemiah 8: "*They read from the book, from the Law of God* (Neh 8:8)—this refers to Scripture; *clearly* [*měpōrāš*]—this refers to Targum" (*y. Meg.* 74d). A major reason for the origin of the Targum must have been the fact that increasingly in the postexilic period Aramaic replaced Hebrew as the vernacular of the Jews of Palestine. It came to be recognized, however, that the Targum could do more than provide a simple rendering of Scripture into everyday speech: it could be a commentary as well as a translation, and impose a comprehensive interpretation on the original Hebrew. This function of the Targum to provide an acceptable reading of Scripture, which was distinct from Scripture and left the original intact, helps to explain why the Targum continued to be recited even when its language did not correspond to the local dialect of Aramaic (e.g., *Onq.* in Babylonia), or when Aramaic had been replaced altogether by Arabic as the Jewish vernacular in the Middle East. The Rabbis recognized this function of Targum and, as part of their policy to stamp their authority on the synagogue liturgy, they tried to control both its content and the manner of its delivery in synagogue; certain translations were banned (see *m. Meg.* 4:9, with reference to Lev 18:21), and certain passages excluded from translation (the so-called Forbidden Targumim: see Alexander 1976). The Rabbis were concerned that Targum should be clearly distinguished from Scripture: the same person could not publicly read the Hebrew and recite the Targum. Targum belonged to the oral Torah, and the translator had to recite it orally in public, while the reader had to read (and be manifestly seen to read) the Hebrew from the scroll. At the same time it is a fundamental rabbinic principle that the Targum is not a freestanding translation, to be used on its own; it should always be heard and studied in conjunction with the original Hebrew. Even when Targum was studied in the privacy of one's home, the suggested rule was that the *pārāšâ* should be read twice in the Hebrew and once in the Targum (*b. Ber.* 8a). Besides its use as a liturgical version in synagogue, and as a repository of traditional exegesis in private study, the Targum played a role in elementary education (*Sipre* Deut. §161, p. 212). Children appear to have learned it in the *bêt hassēper.* The Hebrew Bible formed the staple of elementary education, and in the absence of formal grammars the Targum provided a valuable aid to the acquisition of the biblical language (York 1979; Alexander 1985). In later centuries Arabic and Yiddish Bible translations served a similar purpose for Jewish schoolchildren.

Fragments of Aramaic translations of the Bible have been discovered at Qumran (4QTgLev, 4QTgJob, and 11QTgJob). This suggests that the Targum is a pre-rabbinic institution which the Rabbis attempted to rabbinize and to control. The culmination of that process was the production in Babylonia of official rabbinic Targumim for the Torah and the Prophets (*Onq.* and *Jon.*). The enormous textual fluidity of the extant Targumim (which must broadly reflect regional variation and a largely oral transmission over long periods) proves that official uniformity was never achieved.

Though aimed primarily at a popular audience, the Targumim are the work of scholars with a deep knowledge of Hebrew, Aramaic, and Bible exegesis. At no stage can they be envisaged as spontaneous renderings of untutored translators. And, despite the present textual fluidity, the content of the Targum in any given locality was probably always largely predetermined and traditional. According to Rabbinic halakah the Targum had to be given orally in synagogue (*Pesiq. R.* 5, ed. Friedman 14a-b; Tanḥuma *Wayyērā᾽* 6, ed. Buber II, 87–88), but there is clear evidence that written texts of the Targumim were in circulation in the Talmudic era: Rabbinic stress on oral transmission related primarily to liturgical use.

It is a matter of dispute just how directly the extant written texts go back to the Targumim of Talmudic times. It would be a mistake to assume that they all represent direct transcripts of the oral Targum delivered in the early synagogue. Certainly some of our texts *were* recited in synagogue: *Onq.* and *Jon.* are cases in point, and some of the Cairo Genizah mss of the PT are clearly marked up for liturgical purposes. However, there are other texts (e.g., *Ps.-J.*) whose liturgical role, at least in their present form, must be seriously questioned. They represent scholarly editions of genuine Targumic traditions put together in the early Middle Ages as serviceable collections of early Bible exegesis.

For full bibliography on the Targumim, see Grossfeld 1972–78; the introductions to Díez Macho 1968–79; and Aufrecht 1974–.

TARSHISH (PERSON) [Heb *taršîš* (תַּרְשִׁישׁ)]. Var. TARSHISHAH. As an Israelite name,

"Tarshish" belongs to a class of names drawn from words for precious stones (*IPN,* 223). Three persons in the OT bear this name.

1. One of the four "sons" of Javan, the "son" of Japheth, and thus a great-grandson of Noah (Gen 10:4 = 1 Chr 1:7). The author of Genesis 10 is clearly intending to set forth tribal and national entities (the so-called "Table of Nations"), and thus the references to this son of Javan are also references to a place by the same name. See TARSHISH (PLACE).

2. One of the seven sons of Bilhan, the son of Jediael, listed in the military census of the Israelites (1 Chr 7:10). This Tarshish is therefore the great-great-grandson of Jacob through Benjamin.

3. One of the seven princes of Persia and Media who were advisers to king Ahaseurus (Esth 1:14). These men were the most prominent at the court (lit. "sat first in the kingdom") and had the privilege of personal audience with the king (lit. "saw the king's face"). Extrabiblical sources attest to such a council of seven prominent nobles customarily advising the Persian monarch (see Paton, *Esther* ICC, 153; and especially *ISBE* 3:971). Although it is reasonable to presume that the names of these counselors are Persian (see Millard 1977, who counters the excessive caution of Moore [*Esther* AB, xli–xliv] regarding the reliability of the MT spellings), no name equivalents to this have thus far been found in the extrabiblical literature, nor has a generally acceptable Persian etymology been suggested (despite Paton, *Esther* ICC, 68).

FREDERIC W. BUSH

TARSHISH (PLACE) [Heb *taršîš* (תַּרְשִׁישׁ)]. Var. TARSHISHAH. According to the Table of

Nations (Gen 10:4), Tarshish is one of the four sons of Javan, the son of Japheth, and thus a great-grandson of Noah. See TARSHISH (PERSON). The descendants of the siblings of Tarshish are associated with maritime countries in the Mediterranean and Aegean (Elishah, Kittim, Rodanim), so the descendants of Tarshish could well be found in this same area. In spite of over 30 references to Tarshish in the OT, its exact location is still a matter of debate.

A. Precious Stones and Ships

Seven of the references use Tarshish in the description of a precious stone (Ezek 28:13). The stone is used in the priestly breastplate (Exod 28:20; 39:13) and is known for its beauty (Cant5:14) and flaming brilliance (Dan 10:6; cf. Ezek 1:10; 10:9). It has variously been identified as chrysolite (LXX; NIV), topaz (NEB) or beryl (RSV; JB). Its name, Tarshish, apparently derives from its geographical source, but the references provide no direct clue as to where that might be. There needs to be a mutual interaction between proposed sites and the identification of the stone to check for minerals which might not naturally occur in a suggested site.

Ten further references use Tarshish to describe ships. Some of these were in the service of Solomon, along with Phoenician ships, in trade for gold, silver, and exotic merchandise (1 Kgs 10:22; 2 Chr 9:22). It is generally accepted that these ships were harbored at Ezion-Geber on the Red Sea, because mention is made of ships built there for Solomon, manned in part by Phoenician sailors (1 Kgs 9:26–27), though in this context they are not specifically identified as Tarshish-ships. Those ships built by Jehoshaphat to sail for gold to Ophir at least made landfall at Ezion-Geber, since they were ultimately wrecked there (1 Kgs 22:48; cf. Ps 48:8, where similar ships are destroyed by a violent east wind). A bit more detail is provided in the account of the same incident in 2 Chr 20:36–37. Here the ships are explicitly stated to have been built in Ezion-Geber "to go to Tarshish." The contrast in function and destination could indicate a misunderstanding on the part of the Chronicler concerning what was meant by a "Tarshish ship" in his source documents.

In several cases it is the Mediterranean rather than the Red Sea which is the field of operation of the Tarshish-ships. They carried heavy cargoes of the wares of Tyre (Ezek 27:35), and they are to weep when it, their harbor stronghold, is destroyed (Isa 23:1, 14; cf. v 10. In an eschatological passage describing the future glory of Zion with abundance flowing into Israel, maritime areas usually associated with the Mediterranean will give up their Israelite exiles along with their gold and silver to Tarshish-ships in order to restore them to Israel (Isa 60:9).

The final ship collocation does not describe location but grandeur and great size. The Day of the Lord will not only humble the high mountains and the cedars of Lebanon, but also the Tarshish-ships (Isa 2:16), which appear to have become proverbial for their great size.

In these contexts, Tarshish has been generally understood to refer to a geographical location, but there is a difficulty in that the references point both toward the Mediterranean and the Red Sea, which makes a single-site identification tenuous.

B. Etymologies

Albright suggested a different approach to the name Tarshish, associating it with the Akkadian *rašāšu* "to heat, melt, smelt" (Albright 1961: 347 and n. 96; cf. *AHW*, 960–61). In this case the form *taršišu* might be a refinery. This would then lead to an understanding of the ships as oar boats, providing transport of the raw material to the refinery, or as carriers of the purified metal from the refinery. In support of this interpretation is the association of Tarshish-ships (Isa 60:9), and Tarshish itself (Ezek 27:12), with metal. Also supportive is the great size of the ships (Isa 2:16), necessitated by their heavy cargo (Ezek 27:25). This type of vessel would thus be expected wherever there was bulk trade in metal, so their occurrence in association with two unconnected seas no longer poses an insurmountable problem.

Wiseman tentatively suggested another etymology for the name, from the Greek *tarsos* "oar" (*NBD,* 1180). This receives some support from the identification of Tarshish-ships with those from Mycenae which had 30 to 60 double banked oars (Barnett 1958: 226), but it has not been widely accepted.

C. Geographical Locale

Tarshish as a geographical location is mentioned in several places. Three verses speak of it as a source of precious metal (Jer 10:9; Ezek 27:12; 38:13). The exact location of Tarshish, or even its direction in relation to Israel is not univocal. Its association with the West and the Mediterranean is best known from Jonah's flight toward Tarshish from Joppa on the W seaboard of Israel (Jonah 1:3; 4:2). Its further association with the "islands," mainly a designation of maritime areas W of Israel, also points in the same direction (Ps 72:10; Isa 23:6, where it is also associated with Egypt and Sidon; 66:19, associated with

Asia Minor and Greece). There are also weaker links with the S in the literary connections of Tarshish and Sheba, Seba and Dedan (Ps 72:10; Ezek 38:13).

Extrabiblical sources and cognate terms have been used as evidence for locating Tarshish. Tartessus in SW Spain, a Phoenician colony on the Guadalquiver River, has received some attention (Herodotus 1.163; 4.152; Albright 1961: 347). The area is known for its metals (Strabo *Geog.* 3.2.11) and chrysolite is found there (see Pliny *HN* 37, 43; Driver 1963: 498), though not true topaz. Mineral deposits are also found on Sardinia, where a Phoenician inscription of approximately the 9th century B.C. was found. It apparently refers to one of its towns as Tarshish (*CIS* I: 144; Albright 1961: 346–47). A more recent suggestion is that Tarshish is to be identified with Carthage in N Africa (Berger 1982: 61–65). In part this identification is made on the basis of the LXX reading of the name in Ezek 27:12 as *karchēdonioi* "Carthage."

Tarshish *(tarsisi)* is mentioned in Akkadian sources from the 7th century B.C. on (Parpola 1970: 349), but the extent of Assyrian contact or knowledge of the area so far W is not clear.

Part of the ambiguity of identification of Tarshish could well be the descriptive rather than definitive role of the name. It is used not to clearly identify one discrete geographical site, but rather to indicate what activity—smelting or refining—went on in a location. The term could therefore very easily refer to any number of different sites, including all of the suggestions made previously, as well as Ezion-Geber itself and other Red Sea locations. The same multi-reference usage might also be evident in the name Carthage, Semitic *qrtḥdšt* "New Town." It is also generic enough to apply to a number of locations. In addition to the N African locale, there is also a Carthage on the coast of W Spain (Strabo *Geog.* 3.2.10; Hallward 1930: 31, 34), which is in close proximity to the earlier Tartessus. Berger's argument identifying Tarshish and Carthage (1982) therefore might not be incompatible with its identification with Spain.

Because of the ambiguity regarding the identification of Tarshish, we are not able to say with confidence where Jonah was heading when he set sail from Joppa. All we can be sure of is that he was going west, and that he thought he would be leaving his God behind.

DAVID W. BAKER

TARSUS (PLACE) [Gk *Tarsos* (Ταρσος)]. The principal city of the fertile plain of East Cilicia in SE Asia Minor, remembered today as the home of Saint Paul.

A. Location

The ancient territory of Cilicia was composed of two quite distinct parts. In the E there was a fertile plain, called Cilicia Pedias ("Flat Cilicia"), extending from the edge of the Taurus Mountains in the N to the sea in the S. The major trade route from Syria to central Asia Minor ran through this coastal plain, crossing the Amanus Mountains by the Syrian Gates and then the Taurus range by the Cilician Gates. In the W there was the rugged coastland of Cilician Trachaei ("Rough Cilicia"), where the Taurus Mountains extend all the way to the sea. The latter was notorious in antiquity as a refuge for pirates, as well as a source of mercenaries and timber. Tarsus was the chief city of the E plain, located about 10 miles (16 km) up the river Cydnus and 30 miles (50 km) S of the celebrated Cilician Gates. It is a Turkish city today of just under 100,000 inhabitants.

B. History

Tarsus is at least 4,000 years old. The Hittite texts refer to the region of Cilicia as "Kizzuwatna" and make specific mention of Tarsa (Tarsus) and Adaniya (Adana). The historical foundations of the city are somewhat confused in the sources (Hemer *ISBE* 4: 735). It is no longer tenable to identify it with the

biblical Tarshish (Gen 10:4), but we know it existed as a fortified city and trade outpost before 2000 B.C. The whole region was linked by treaty to the Hittite empire and was later incorporated in it until its demise ca. 1200 B.C., when it was destroyed by the invasions of the Sea Peoples. Resettled by Greeks, in the 9th century B.C. the city, along with all of Cilicia, came under the control of the Assyrians. Tarsus is mentioned in the Black Obelisk of Shalmaneser III (9th century B.C.). From the early 6th century B.C., the region was ruled by a succession of local puppet kings bearing the dynastic title "Syennesis," who continued to rule under the Persian empire until ca. 400 B.C., when they were replaced by Persian governors (satraps). In spite of its Greek heritage, the city of Tarsus was dominated by the oriental culture imported as a result of the influence of its eastern overlords. Coins during the Persian period (5th–4th centuries), for example, bore the legend *Baal Tarz* ("lord of Tarsus") rather than the name of the Greek god Zeus. In 333 B.C., Cilicia was conquered by Alexander the Great, when he defeated the armies of Darius III at Issus and so opened up the way into Syria. Tarsus was saved from being burned by the retreating Persians (Arr. *Anab.* 2.4–5; Quintus Curtius *Historiae Alexandri* 3.4.14–15) and came under the rule of the Seleucids for the next two centuries, and, as a result, became Hellenized (though without ever losing entirely its oriental character; see Ramsay 1907: 122–31; 198–205).

Under the Seleucids, Tarsus was given a new name, Antioch-on-the-Cydnus, and a new constitution with a degree of municipal autonomy (in the aftermath of the revolt mentioned in 2 Macc 4:30–31, 36). Ramsay (1907: 161–86) suggested that the new constitution given by Antiochus Epiphanes (175–164 B.C.) provided the occasion for new colonists, including both Greeks (especially Argives) and Jews. The latter were probably given citizenship rights as a group and enrolled in a civic "tribe" (Gk *phylē,* Lat *tribus*), with its own religious ceremonies. There is no certain proof for this supposition, but there is evidence that this was the case in cities like Alexandria, Cyrene, Syrian Antioch, Ephesus, and Sardis (Bruce 1977: 36). In 83 B.C. the city came under the power of Tigranes I, king of Armenia, ally and son-in-law of Mithridates VI, but then passed rather quickly into Roman hands through the conquests of Pompey (67 B.C.), who established Tarsus as the capital of the province of Cilicia. Cicero resided in the city as proconsul of Cilicia in 51–50 B.C. (*Att.* 5.20.3; *Fam.* 2.17.1). The city enthusiastically welcomed Julius Caesar in 47 B.C. and adopted the name Iuliopolis in his honor. After the death of Caesar and the defeat of the anti-Caesarian party at Philippi in 42 B.C., Tarsus received the status of a free city by Antony, who controlled the eastern Roman provinces. And it was at Tarsus that the celebrated meeting took place between Antony and Cleopatra of Egypt, who sailed up the Cydnus on a barge in the guise of Aphrodite (Plut. *Vit. Ant.* 26).

Under Augustus, Tarsus enjoyed a variety of special privileges, including exemption from imperial taxation (Bruce 1977: 34), and reached the height of its prosperity. Tarsus also became a center of intellectual life (Finegan 1981: 53). To reform the administrative structure of the city, Augustus sent his former tutor, Athenodorus, the Stoic philosopher, who was himself one of the city's most illustrious sons. Athenodorus and his successor, Nestor the Academic (tutor of Marcellus, the nephew and intended heir of Augustus), initiated not only civic reforms, including the requirement that citizens must have a net worth of at least 500 drachmae, but also significant cultural and educational institutions. According to Strabo (14.5.131), the people of Tarsus in the 1st century C.E. were keen students of philosophy, the liberal arts and the entire encyclopaedia of learning; this was true to such a degree that it surpassed both Athens and Alexandria as a center of culture and learning, even though people did not, as a rule, come from other regions to study in its schools. Native Tarsians, however, went on to study elsewhere and frequently held educational and civil posts of importance throughout the empire. A less-flattering picture of Tarsus during the 1st century is found in Philostratus's *Life of Apollonius of Tyana*, the neo-Pythagorean sage. According to the story, Apollonius (who would have been a contemporary of Paul) went to Tarsus at the age of fourteen to study with the rhetorician Euthydemus but was shocked by the frivolous and luxury-loving atmosphere of the city and withdrew to a more congenial environment (*VA* 1.7). This account, written nearly two centuries after the event, is probably influenced by knowledge of two orations by Dio Chrysostom, in which he addresses the Tarsians and castigates them for their lack of moral earnestness (Bruce 1977: 35).

C. Home of Paul

Whatever the fame of Tarsus prior to the 1st century A.D., the city's fame today rests in its association with Paul the apostle (Acts 9:11, 30; 11:25; 21:39; 22:3), missionary hero of the second part of the book of Acts (chaps. 13–28). Although Paul is only connected explicitly with Tarsus in Acts, there is no reason to doubt that he was, as he asserts to the Roman tribune Claudius Lysius, "a native of Tarsus in Cilicia, a citizen of no mean city" (21:39). "The claim to citizenship of a Greek city is unusual in a Jew, and possible only where a special constitution made a body of Jewish citizens possible" (Hemer 1989: 127). But there is evidence that there were Jews who were citizens of Greek cities (as, for example, inscriptions from the synagogue recently excavated at Sardis demonstrate; Philostr. *VA* 6.34 presupposes that Jews were known to be citizens of Tarsus), and there are indications that the refoundation of the city by Antiochus Epiphanes may have created this possibility (cf. above). However, Ramsay (1907: 228–35) and others were probably wrong in overestimating the influence of his native city on his life. Rather than having studied Greek philosophy and graduating from the university of Tarsus, so to speak, it seems likely that Paul was sent to Jerusalem as a youth to receive the proper educational formation that wealthy but pious Jewish parents would desire for their child (so van Unnik, Bruce, Hemer, Finegan). In Acts 22:3, Paul informs his Jewish brethren in the courtyard of the Jerusalem temple: "I am a Jew, born in Tarsus of Cilicia, but brought up in this city, educated at the feet of Gamaliel according to the strict manner of the law of our fathers …" The three participles used here suggest three stages in Paul's life, namely, (1) his birth in Tarsus, followed by (2) being raised as a child *(anatethrammenos)* in Jerusalem and (3) subsequent education as a youth in the school of Gamaliel. The narrative of Acts also makes an incidental reference to a sister who lived in Jerusalem (23:16). Thus, it seems likely that whatever formal instruction Paul had in the classics of Greek literature and philosophy he would have received in Jerusalem rather than in Tarsus, if the Acts account is to be accepted as historically reliable. Contrary to Ramsay and others, this fits quite nicely with Paul's rather scanty use of Hellenistic writers and ideas, as well as his much deeper dependence on the Pharisaic Jewish heritage (Bruce 1977: 41–52). Paul's trade as a "tentmaker" (Gk *skēnopoios*) (Acts 18:3) has usually been identified with his family home in Tarsus, which was (and still is today) famous for a type of felt cloth (Lat *Cilicium* or Gk *Kilikion*) made from the wool of the shaggy black goats characteristic of Cilicia, but Hock (1980: 20–25) argues that *skēnopoios* means "leatherworker" rather than "tentmaker." The evidence seems inconclusive (Hemer *ISBE* 4: 736; 1989: 119). Whatever trade Paul learned as a boy, he most likely learned it in Jerusalem rather than Tarsus.

The remains of the 1st-century city of Tarsus lie underneath the modern city and have been therefore largely inaccessible to archaeologists. The remains of the Sea Gate (dubbed "Cleopatra's Gate") are still standing, and the foundations of a number of Greco-Roman buildings have been uncovered in the process of modern excavations. A small outpost of the city, today known as Gözlü Kule, has been excavated under Hetty Goldman, and a large number of terra-cotta figurines of mythological characters, deities, animals, and people (Finegan 1981: 54–55).

W. WARD GASQUE

TARTAK (DEITY) [Heb *tartāq* (תַּרְתָּק)]. The deity Tartak is attested only once in the ANE, in 2 Kgs 17:31. The god is mentioned as having been brought to Assyrian-controlled Samarina, after the fall of Israel, by the Avvites whom the Assyrians resettled in the land. The absence of any hard extrabiblical

evidence for this deity has led to innumerable theories, more ingenious than illuminating. Three theories proposed around the beginning of the 20th century remain the favored identifications of the divinity.

Talmudic tradition (*Sanh.* 63b) states that Tartak has the form of an ass; this information, along with an attempt to associate the name with a Persian word for "intense darkness" led to a theory that Tartak was possibly a chthonic deity (*SDB* 4: 3182; Slotki 1950: 268).

Montgomery (1914: 74) argued that Tartak was a vastly altered form of the name Atargatis, a Syrian goddess known from Greek sources. The names are sufficiently different and the emendations so conjectural that the identification is unlikely. However, the theory remains popular with cautionary notes (Gray *1 and 2 Kings* OTL, 654).

Hommel (1912: 118) suggested that the pair of deities Nibhaz and Tartak had been found together, and in that order, on a list of Elamite gods published by Meissner (1910: 66). A certain amount of reconstruction is entailed, especially with *dag-da-ad-ra* (or the proposed variant *dir-tak*). While this theory would have the gods come from Elam, nothing is known about either deity from Elamite sources at this time, but it has proved attractive for supplying an origin for the god (Cogan and Tadmor *2 Kings* AB, 212).

TARTAN [Heb *tartān* (תַּרְתָּן)]. The tartan (Assyrian *turtānu*) was a high-ranking Assyrian official who, together with the RABSHAKEH and the RABSARIS, played an important role in the siege of Jerusalem by Sennacherib as described in 2 Kings 18–19. For further details about the siege, see SENNACHERIB. Regarding high ranking officials in the Assyrian administration, see MESOPOTAMIA, HISTORY OF (ASSYRIA). The title tartan also appears in the MT of Isaiah 20:1 which in the English versions is translated as "the commander-in-chief." In this passage the tartan of Sargon II of Assyria is credited with the siege and capture of Ashdod. See SARGON.

A. KIRK GRAYSON

TASSEL. See DRESS AND ORNAMENTATION.

TATIAN. Christian apologist of the 2d century who is best known for having been a pupil of Justin Martyr, writing a defense of the Christian faith which was mainly an all-out attack on Greek culture, composing a gospel harmony called the *Diatessaron,* and founding a very ascetical and possibly heretical sect known as the Encratites.

Tatian says that he came from Assyria (*Oratio ad Graecos* [*Or.*] 42), which could mean anywhere E of the Euphrates. Nothing is known of his early years except what may be gained by inference. Growing up in one of the petty kingdoms which formed a buffer zone between the territories of the Romans and Parthians, he lived in an area where the Hellenistic culture imposed on society by the Seleucids was declining and the native Semitic culture was reemerging. Tatian nevertheless cast his lot with this disappearing culture and studied rhetoric with the intention of becoming a sophist, the most glamorous profession of his day.

His studies and career took him eventually to Rome, the goal of all aspiring sophists. Whatever his success in the profession, it was not extensive enough to have been noticed by any pagan writer whose account is preserved. After having been at Rome some time, he was converted by reading the Bible (*Or.* 29). His conversion does not seem to have been (as Justin's was) the result of a philosophical quest but instead the superiority of biblical religion was established on religious grounds. Justin probably was not the one who evangelized or catechized Tatian since the account of Justin's martyrdom shows that he functioned instead as a Christian version of the school-keeping philosophers of the time.

At some point, Tatian wrote his apology, *Logos pros hellenas,* known by its Latin name, *Oratio ad Graecos.* It is not addressed to the emperor, as so many apologies were, in the hope that it would be signed as a rescript and thus give legal protection to the Christians. Rather, it is addressed to the Greeks—that is, those educated in Greek culture—and devotes more space to attacking that culture than it does to defending Christianity or setting forth its beliefs systematically. Few writings from antiquity show emotion as genuine as Tatian's hatred for the culture in which he had set out to make his career. His onslaught against Greek culture is actually our only source for some information about details of Greek culture. The catalog he gives of Greek sculpture (*Or.* 33, 34), for instance, supplements even what is known from Pliny. Most of the material he uses appears to be gleaned from the doxographies available to orators of the time. Indeed, the apology itself is a showpiece of Asianic rhetoric. There has been much debate about the date of composition of the *Logos* as well as about the document's intended purpose. But the debate has yet to produce agreement among scholars.

The sole solid date we have for Tatian is the time of his return to his native Mesopotamia, 172 C.E.; the date derives from Eusebius *Chron.* 12 and Epiphanius *Adv. Haeres.* 1.3.46. At some point, he produced his gospel harmony, the *Diatessaron,* but there is much disagreement about whether it was written in Rome or after he returned to the East. Closely connected is the question whether its original language was Greek or Syriac. The *Diatessaron* fell into disfavor with Theodoret in the 5th century, despite its general use in churches of Upper Syria. All accessible copies (about 200) were destroyed by order of Theodoret. No complete copy is extant today. The only known survivals of it are a Greek page discovered at Dura-Europos and a recently discovered commentary on the Diatessaron by Ephrem Syrus. Many scholars associate the *Diatessaron,* perhaps mistakenly, with readings in a number of later gospel harmonies and other documents in a wide variety of languages.

When he returned to Mesopotamia, Tatian must have felt at home in the very ascetic forms of Christianity he found there. If he ever became heretical it must have been then, because his *Logos* is perfectly orthodox. Nothing is known about his Encratites except that he is supposed to have been their founder, but a few fragments attributed to him do indicate both extreme asceticism and some doctrinal deviations. Since, however, no Syriac document mentions him for centuries, this whole issue is obscure.

TATTENAI (PERSON) [Aram *tattĕnay* (תַּתְּנַי)]. Var. SISINNES. Persian governor of the province Beyond the River during the reign of Darius I (ruled 521–486 B.C.E.) who sent a letter to inform the king of building activity in Jerusalem (Ezra 5:3, 6; 6:6, 13 = 1 Esdras 6:3, 7, 27, and 7:1). Tattenai is one of the few Persian officials mentioned in the Hebrew Bible for whom there is external attestation. The tablet naming Tattenai is dated in the year 502 B.C.E. "The crucial passage is a reference to a slave of ^{m}Ta-at-(tm)tan-niž , governor *(pahal)* of Ebir-nari" (Olmstead 1944: 46). Williamson (*Ezra, Nehemiah* WBC, 76) says, "Tattenai himself is now known to have been at this time governor of Beyond the River only, and thus subordinate to Ushtannu, who was governor of Beyond the River and Babylon together." Tattenai led an investigation into the building of the temple in Jerusalem (vv 3–5). After making their

inquiry, Tattenai, "and Shethar-Bozenai, and his associates" (Ezra 5:6) sent a report to Darius informing him of the building activity in Jerusalem and asking whether a decree was issued authorizing the work. Williamson suggests that the associates in v 6, are "inspectors" (Williamson *Ezra, Nehemiah* WBC, 77). Darius's response to the inquiry is favorable to the Jews, and Tattenai complied "with all diligence what Darius the king had ordered" (Ezra 6:13). The narrative and letters in this section of Ezra are in Aramaic. The study by Hensley (1977) maintains the authenticity of the letter (vv 5:7b–5:17).

DAVID E. SUITER

TAU. The nineteenth letter of the Greek alphabet.

TAVERNER'S BIBLE. See VERSIONS, ENGLISH (PRE-1900).

TAVERNS, THREE (PLACE). See THREE TAVERNS.

TAW. The twenty-second (and final) letter of the Hebrew alphabet. In its early forms it resembled an "X," and was used as a personal "mark" or signature. Thus, "my signature" in Job 31:35 is literally "my taw."

TAWILAN (M.R. 196972). The site of Tawilan was first surveyed by N. Glueck who suggested (1935: 82–83, 177) that it might be identified with biblical Teman in the land of Edom (Jer 49:7, 20; Ezek 26:13; Amos 1:12; Obad 9; Hab 3:3). However, modern scholarship follows de Vaux (1969) who equates Teman with a region of S Edom hence the equation of Teman with Tawilan is no longer considered acceptable. No other biblical candidate for Tawilan has been suggested.

Tawilan is located in central Edom, near the modern village of Wadi Musa (El-Ji), just outside the Nabatean capital of Petra. The exact course of the Kings' Highway (the major N–S route through Transjordan) is unknown at this point, but it presumably passed close to Tawilan. Access to the Wadi Arabah and the W is also possible here.

The site is situated on a terrace at the W foot of the Jebel Heidan. Its establishment seems to have been with a view to agriculture rather than defense since the terrace is fairly flat and the site is overlooked by a nearby slope. Glueck (1935: 83) identified what he thought might be defensive walls, but Bennett (1984: 2) states that "nowhere in the excavations did we come across any fortifications or any structures which might be considered defensive." The closest known water source is the perennial ʿAin Musa, several km to the SE.

Excavations at the site have been undertaken by C.-M. Bennett (1968–70) and the British Institute at Amman for Archaeology and History (1982). Three major trenches were opened, in which four phases of Iron Age occupation were isolated by the excavator (Bennett 1984: 4):

Phase 1: The site was used as a source of clay with a settlement presumably in the vicinity (10th–9th centuries B.C.).

Phase 2: Uneven bedrock levelled with stone and clay. Flimsy stone partition walls and pillars in some places overlie the Phase 1 pits. Other pits were constructed to house storage jars (8th century B.C.).

Phase 3: Architecture becomes more elaborate with steps up to various levels (8th–7th centuries B.C.).

Phase 4: Doorways and entrances were blocked and some of the major walls rebuilt or repaired (7th–5th centuries B.C.).

These dates are highly speculative, particularly the 10th–9th century date for Phase 1 where there is very little supporting evidence. Furthermore, the phases are mostly based on additions and modifications to existing structures. Phases seldom overlie each other. It is possible that the village was not in use for more than about 200 years.

The only absolute date available for Tawilan comes from Phase 4 where, in Trench III in a blocked doorway, was found a cuneiform clay tablet. It has been published by Dalley (in Bennett 1984: 19–22)

and is a business document recording the sale of livestock. It is dated to the accession year of a King Darius, mostly probably Darius I (521–486 B.C.), indicating that Tawilan was still functioning at the end of the 6th century. An overall date of 7th–6th centuries B.C. for Tawilan seems most likely, but the phases cannot be accurately dated within this.

There is no evidence for substantial occupation of the site following the Iron Age. The site was used as a cemetery at some point, probably during the Romano-Nabataean period (ca. 2d century B.C. to 3d century A.D.). There is some evidence for Mamluk occupation, but no clear associated structures.

STEPHEN HART

TAX COLLECTOR. Among the NT writings, only the Synoptic Gospels recount Jesus' association with tax collectors (*telōnai,* KJV, "publicans"). Three problems attend this picture: (1) the identity and status of the *telōnai,* (2) the moral evaluation of them, and (3) the significance of Jesus as "a friend of tax collectors and sinners" (Matt 11:19; Luke 7:34).

A. Identity and Status

Etymologically *telōnēs* is a combination of *telos* in the sense of something paid for the purpose of the state, a toll, tax or duty; and *ōneisthai* (noun, *ōnē*), to buy or purchase. Its earliest usage describes those in the Greek city-states who purchased the right to collect taxes or who were contracted by civic officials to do so. The lessee would pay the state in advance the sum to be collected for the coming year and the cost of the enterprise and the profit for the individual collectors would be the responsibility of the lessee. The practice was taken over by Rome, and during the expansion of the Roman Republic, taxes were collected in the provinces by groups of individuals, the *societas publicanorum*, composed principally of Romans of the Equestrian order (Badian 1976: 48–66). Tax collecting became a lucrative and politically important occupation (Finley 1973: 60) and Roman writers recount that the publicans often exploited the provinces. The system was drastically curtailed, first by Julius Caesar and later, under the Principate, by Augustus (Garnsey and Saller 1987: 87).

After the conquest of Palestine in 63 B.C.E. by Pompey, Palestine was forced to pay tribute to Rome. The Roman publicans were active for a short time, and employed indigenous officials (high priests and local assemblies) as their agents. Under Gabinus (57 B.C.E.), who was opposed to the publicans, the district sanhedrins were made responsible for collection of taxes (Smallwood 1976: 33). After his defeat of Pompey at Pharsalia in 48 B.C.E., Julius Caesar reorganized the province of Syria and the publican system, which had never become entrenched in the provinces of Egypt and Syria, disappeared totally in Judaea. Julius Caesar made the ethnarch Hyrcanus responsible for the collection of the taxes, and shortly before his death in 44 B.C.E. authorized the rebuilding of the walls of Jerusalem and a reduction in taxes (Smallwood 1976: 42). Under Herod the Great (37–4 B.C.E.) direct taxes were collected by royal officials, attached to the court. When Judaea came under the Roman prefects in 6 C.E. (called procurators after 44 C.E.), the direct taxes, the "head" or poll tax and the land tax were collected by officials in direct employ of the Romans. In Galilee, similar officials were under the supervision of Herod Antipas (4 B.C.E. to 39 C.E.).

In addition to the principal taxes, the personal or poll tax *(tributum capitis)* determined by the census (Luke 2:2; Matt 17:25; Acts 5:37) and the land tax *[tributum soli]*, there were a host of indirect taxes, especially on the transport of goods. Jews were also subject to religious taxes such as the temple tax and tithes on produce for the Jerusalem priests (Perkins 1984: 185–86). This double burden of taxation created considerable hardship and often precipitated both passive and violent resistance (Freyne 1980: 281–87; Horsley 1987: 61–62). Collection of the indirect taxes was most likely subcontracted (farmed out). The term *telōnai* could be used of three distinct groups (Herrenbrück 1981): (1) those who purchased the right to collect specific taxes, (2) supervisory officials like Zacchaeus (called *architelōnes* in Luke 19:2), who

had the opportunity for personal gain (Luke 19:8), and (3) their employees who collected such taxes at toll booths or tax offices (*telōnion,* Mark 2:14; Matt 10:3; Luke 5:27). The *telōnai* with whom Jesus associates in the Gospels are most likely "toll collectors." They appear at transport and commercial centers (Jericho and Capernaum) and when John preaches to them (Luke 3:12–13), he tells them to collect no more than is "appointed" (*diatetagemenon,* which suggests minor functionaries fulfilling the orders of higher officials).

B. Moral Evaluation

Negative views of the *telōnai* occur in secular literature, in the NT, and in rabbinic writings. In Roman and Hellenistic literature they are lumped together with beggars, thieves, and robbers (Cicero, *De offic.* 15–51; Diogenes Cynicus, *Ep.* 36.2; Lucan, *Pseudolog.* 30; Dio Chrysostom, *Orat.* 14.14; Michel *TDNT* 8:99). In the NT they are paired with sinners (*telōnai kai hamartōloi,* Mark 2:15; Matt 9:10; 11:19; Luke 7:34; 15:2) and with "immoral people" (*pornai*, Matt 21:31), and they are likened to Gentiles (Matt 5:46; 18:17). The Pharisee contrasts himself with "other men, extortioners, unjust, adulterers, or even this tax collector" (Luke 18:11) and Jesus is accused of being a drunkard and "a friend of tax collectors and sinners" (Matt 11:19). The rabbinic writings (which, though not written before the 3d century C.E., incorporate early oral traditions) link both tax and toll collectors *(gabbā᾽îm* and *môkĕsîn)* with robbers, murderers, and sinners (*m. Ṭohar.* 7.6; *m. B. Qam.* 10.2; *m. Ned.* 3.4) and appear in lists of "despised trades" which no observant Jew should follow (*b. Sanh.* 25b; Jeremias 1969: 302–12). The parable of Bar Ma'jan, a tax collector, which most likely dates from the 1st century and may have influenced Jesus' parable of the Great Supper (Luke 14:16–24; Matt 22:1–10) reflects similar negative views. Though not having lived a pious life he is given a fine funeral because he did "a single good deed" in his lifetime by inviting the poor to a banquet when the city counselors did not come (*y. Sanh.* 6.23c; Jeremias 1972: 178–80).

C. Jesus and the Tax Collectors

The two major sources of the Synoptic Gospels, Mark (2:15–16) and Q (Matt 11:19 = Luke 7:34) as well as Luke's special material (Luke 15:1–2; 19:1–10), affirm that Jesus associated with and had table fellowship with tax collectors. In Matt 10:3, one of the Twelve, Matthew, is called a tax collector (Mark 3:18; Luke 6:15). Luke 3:12–13 records that tax collectors were baptized by John, while Matthew mentions that "tax collectors believed him" (Matt 21:32). Despite claims that such fellowship may be a creation of the early church (Walker 1978: 238; Horsley 1987: 216), both the multiple attestation of the sources as well as the improbability that the church would join Jesus to such social outcasts argue that such association was an authentic practice of Jesus. It also is consistent with the accounts of Jesus' concern for other marginal people such as Samaritans (Luke 10:29–37; 17:16), widows (Mark 12:40–44; Luke 20:47–21:4; Luke 7:11–17), and the poor (Luke 6:20–23).

The gospels also attest to the opposition evoked by Jesus' association with tax collectors (Mark 2:15; Matt 9:11; Luke 5:30; Luke 15:1). Jeremias (1969: 310) argued that, because of their tendency to enrich themselves through dishonesty (Luke 3:11–12; 19:8), they were thought to be sinners for whom repentance was difficult. Perrin (1967: 93–94) claimed that they were considered "Jews who made themselves as Gentiles," and were especially scorned as "Quislings" because they collected taxes from their fellow Jews on behalf of the hated gentiles. While the precise basis of opposition to them is uncertain, in Galilee, which was not directly under Roman prefects during the ministry of Jesus, they would not have been employees of gentile rulers, but officials of a Jewish client king. However in Judaea they would have been more directly linked with Roman administration, so opposition there to Jesus' actions could have been more intense (Donahue 1971: 59–61).

Jesus' association with them is viewed as an "acted parable" of his message of God's mercy to sinners and "an anticipatory sitting at table in the kingdom of God" (Perrin 1967: 107). Parables such as the Two Debtors (Luke 7:41–43), the Two Sons (Matt 21:28–31), the Lost Sheep (Luke 15:3–7), the Lost Coin (Luke 15:8–10), and the Prodigal Son (Luke 15:11–32) vindicate Jesus' concern for "the lost" and association with tax collectors and sinners (Jeremias 1972: 124–36). This association is also to be interpreted in the context of those traditions in the gospels where Jesus' actions challenge the religious

and social conventions of his time, such as the forgiveness of sin (Mark 2:1–12), and violation of the sabbath by plucking grain or healing (Mark 2:23–3:6).

JOHN R. DONAHUE

TAX OFFICE [Gk *telōnion* (τελωνιον)]. The place where Matthew or Levi, the son of Alphaeus, was sitting when Jesus recruited him in the parallel passages Matt 9:9, Mark 2:14, and Luke 5:27. The word occurs elsewhere in the Greek-speaking east and seems to refer to a public building where custom duties of various kinds were collected (see Dittenberger 1905, 2: #496 line 9). Presumably this is the place of business of the *telōnēs,* "tax farmer" or "tax collector," a figure much despised in the Roman world.

DANIEL C. SNELL

TAXES AND TAXATION. The revenues received by governments in money, in kind, or in labor; the process of extracting those revenues.

Taxation is extremely important to the state, and the state cannot be said to exist in its fullest form if it has no taxing power. In the states about which we are informed in the ANE and the biblical record we know little about that power because our documents come from persons who were not very interested in how it worked. There are in the Bible traces of resistance to taxation and measures like the census of King David that appear to have been connected with taxation (2 Samuel 24). A simple society was being asked to pay for David's adventures in new ways, and its leaders did not always like the new order.

There are surprisingly few words for "tax" in Biblical Hebrew. The verb from the root *ʿrk* in 2 Kgs 23:35 seems to mean "evaluate for taxation": "And the silver and the gold Jehoiakim gave to Pharaoh, but he evaluated *(heʿĕrîk)* the land to give the silver according to the Pharaoh's command, each person according to his evaluation brought the silver and the gold …" A similar case is 2 Kgs 15:20: "Menahem exacted the money from Israel, that is, from all the wealthy men *(gibbôrê haḥayil),* fifty shekels of silver from every man, to give to the king of Assyria." These are unusual events, but the use of words from the root *ʿrk* in the Priestly sections about fiscal obligations to the temple shows that *ʿrk* could be used for more regular dues, as in Lev 27:7.

The term also occurs in connection with the temple in 2 Kgs 12:5 (—Eng 12:4): "… All the money of the holy things which is brought into the house of the Lord, the money for which each man is assessed—the money from the assessment (Heb *ʿerek*) of persons—and the money which a man's heart prompts him to bring …" This passage implies that there was a forced taxation for the temple in this period.

But even though the word *ʿerek,* "evaluation, assessment," seems too general to have been the normal equivalent to modern words for "tax" (though one might note that in Middle English *taxen* meant "to

estimate, assess"), it is hard to find any other word that is more likely. The term *mekes* "tax" occurs only in Num 31:28, 37, 38, 39, 40, 41 as a term for obligatory donations for the priests. The lack of detailed vocabulary for taxation implies, probably correctly, that neither the terminology nor the practice of taxation was systematic or well developed in ancient Israel.

The description of the future custom of the envisioned king in 1 Sam 8:15–17 does not use technical words for taxation, but the process is certainly described: "He will take the tenth of your grain and of your vineyards and give it to his officers and to his servants. He will take your menservants and maidservants, and the best of your young men and your asses, and put them to his work. He will take the tenth of your flocks, and you shall be his slaves." There is considerable doubt whether the Israelite or Judean kings ever exercised such broad powers. An incidental reference to a time "after the king's mowings" (Amos 7:1) may imply that the Israelite king had the right to a first mowing of hay. The idea that the king could exempt a household from taxes appears in 1 Sam 17:25, where the troops inform David of what will be done for the man who kills Goliath: "the king … will make his father's house free (Heb *ḥopšî*) in Israel."

The list of governors, or perhaps tax farmers, who supplied Solomon's table in 1 Kgs 4:7–19 implies a regular rotation of supply, but it does not indicate how the officers exacted the food they provided. Tax rebellion seems to be a motive in the speech of the Northern Tribes to Rehoboam in 1 Kgs 12:4, though the language is vague.

Solomon collected transit duties, according to 1 Kgs 10:15. The Chronicler says that Jehoshaphat also received taxes and transit duties (2 Chr 17:5, 11).

From the period of the divided monarchy, the ostraca from Samaria record deliveries of wine for the use of the king; sealings with the label *lmlk* "for the king" found in various sites in Judah indicate that there were central depots to which local taxes in kind were gathered. See SAMARIA (OSTRACA).

Ezra 4:13 and 7:24 show through the offer of tax exemption for the temple-building activities that there may have been "tribute, custom, or toll" (*mindâ, bĕlô* and *hălāk*); the words all have Akkadian etymologies, and so they are not likely to reflect earlier Hebrew practices. (On the *ḫatru* system and related revenue-gathering institutions of the Persian imperial administration of the 5th century B.C.E., see PALESTINE, ADMINISTRATION OF (PERSIAN); PERSIAN EMPIRE.) The people may also have had to pay a tax in kind called "the bread of the governor," which Nehemiah claims he did not take as his due, though previous governors had (Neh 5:14–15). We had no per capita figures for such exactions. See also TITHE.

Another aspect of taxation in Israel was forced labor (Heb *mas*, which may have an Egyptian etymology, from *ms* "bearer"). The oppressive nature of forcing people to work for a period on government projects is clear in a number of texts, and it is remembered as an aspect of Egyptian life in Exod 1:11. Traditions also recall that the Israelites, when they entered the land, imposed forced labor on the subdued population (Josh 16:10). Under David an officer who oversaw the forced labor bore the Phoenician name Adoram (2 Sam 20:24). He succeeded in keeping his post under Solomon (1 Kgs 4:6 and 5:28, both calling him Adoniram), but later was killed by northerners (1 Kgs 12:18). 1 Kgs 9:15 and 21 assert that the great works of Solomon were accomplished with forced labor. But 1 Kgs 5:27 (—Eng 5:13) reports, "King Solomon raised a levy of forced labor out of all Israel; and the levy numbered thirty thousand men." The number seems high, and the duration of service is not known.

It is unclear to what extent the kings of the divided monarchy managed to continue this taxation in labor. It may be significant that Jereboam, first king of the Northern kingdom, got his bureaucratic start as the official over the forced labor (Heb *sēbel*) of the house of Joseph (1 Kgs 11:28; the Hebrew word *sēbel* elsewhere means "hard work"). The fact that this fellow was later chosen to be king implies that being involved in administering forced labor was not always a sure guarantee of unpopularity, and perhaps the principle that the king could demand forced labor for reasonable periods of time had been established in the popular mind. It is implied that King Asa of Judah also imposed forced labor (1 Kgs 15:22). Forced labor was apparently still an issue in 1 Macc 10:34–35, where a Seleucid king grants exemption from work on Jewish holy days.

Mesopotamian and Assyrian taxation is better documented than Israelite in some periods, but its general features are similar. The state demanded a percentage of agricultural staples and perhaps of herds. It also levied taxes on goods transported by merchants, and required at least some citizens to perform labor for the state for part of the year.

In the NT the Greek terms for tax are few and hard to differentiate: *kēnsos* in Matt 22:17, 25, *phoros* "tribute" in Luke 20:22 (using different words in what is clearly the same story), and *telos* "toll" in Matt 17:25, *didraxmon* "half-shekel tax" in Matt 17:24; *apographē* in Luke 2:2 and Acts 5:37 is "writing down in a census" for the purpose of later taxation.

The attitude of the early Christians is demonstrated in the story in Matt 22:17 = Luke 20:22 and Matt 17:25, where Jesus advises rendering unto Caesar what is Caesar's and obeying the taxation requirements of the government (note Romans 13:6–7, using Gk *phoros*). The Roman census at the birth of Jesus in Luke 2:2 seems not to have met with opposition, but a later census did, as we hear in Acts 5:37, if indeed two different censuses took place; see also CHRONOLOGY (NT). The advice to go the extra mile in Matt 5:41 may show that Christians believed that the requirement of forced labor was acceptable.

A half-shekel tax was exacted by temple authorities for the upkeep of the temple; it may at first have been only a third of a shekel, according to Neh 10:32–33. Josephus (*Ant* 18.9.1) says it was collected each year from every Jew twenty years of age and over in the land of Israel and abroad. A head tax was imposed by the Emperor Vespasian on all Jews living anywhere under Roman control after the fall of the temple in 70 C.E., to pay to the Roman government revenues of the temple tax which the Jews had already been used to paying (*JW* 7.218).

DANIEL C. SNELL

TEACHER OF RIGHTEOUSNESS (HALACHIC LETTER). See MIQṢAT MAʿASE HATORAH (4QMMT).

TEACHER OF RIGHTEOUSNESS. The dominant figure associated with the branch of the Essenes that established itself at Qumran. The fifteen references in the published Dead Sea Scrolls, however, furnish only meager information about him. Some are so fragmentary as to yield only the name *môreh haṣṣedeq* (1QpHab 1:13; 4QpPs^{b} [= 4Q173] frag. 1, 4; frag. 2, 2). See also MIQṢAT MAʿASE HATORAH (4QMMT). Despite periodic efforts to argue that the allusion is to a function carried out by different individuals at various stages of the sect's history (Buchanan; Rabinowitz; Starcky), the consensus is that it is the title of a particular personage. Two texts (4QpPs^{a} [= 4Q171] 3:15; 1QpHab 2:8) identify him as "The Priest," which must be understood in a titular sense and so indicates that he was a high priest (Stegemann 1971: 102, 210–20; de Vaux 1960: 267; Schürer *HJP²* 1: 605–6). The Essenes were already in existence when he joined them (CD 1:9–11). Yet he is considered the founder of a community (4QpPs^{a} 3:15–16) in which he enjoyed the status of a prophet (1QpHab 2:3; 7:4–5) whose interpretation was the only valid understanding of the demands of the Law (1QpHab 8:1–3; 1QpMic frag. 8–10, 6–7). For his followers he was the Unique Teacher (CD 20:1) and fidelity to his teaching was the criterion of salvation (CD 20:32). Within the Essene movement, nontheless, he was opposed by the Man of Lies (1QpHab 2:1–4; 5:9–12), and from without he suffered persecution at the hands of the Wicked Priest (1QpHab 9:9–10; 11:4–7).

Is it possible to identify the Teacher with an historical figure? A number of authors have answered in the affirmative and their proposals range from Onias III in the 2d century B.C. to the rebel Menachem during the First Revolt in A.D. 66–70 (Schürer *HJP²* 3/1: 436 n. 7). All the late identifications, however, are excluded by the paleography of the Scrolls, which means that none of the individuals mentioned can be dated after the middle of the 1st century B.C. A much tighter time frame is indicated by the link

between the Teacher and the Wicked Priest, because with great probability this latter figure has been identified with Jonathan Maccabeus (Jeremias 1963: 36–78; Stegemann 1971: 202–7), although some prefer his brother Simon (Schürer *HJP²* 3/1: 435 n. 6, 438). Since the two were contemporaries, the activity of the Teacher must be dated in the middle of the 2d century B.C. In view of 4QpPs[a] 3:15–16 this provides an important correlation, because the first phase of Essene occupation at Qumran could be dated to the second half of the 2d century B.C. (de Vaux 1973: 5), although positive evidence is virtually nonexistent (*DBSup* 9: 748–52).

Although the Teacher was a high priest, his rigoristic attitude toward the Law precludes his identification with any of the Hellenizing high priests who ruled from the murder of Onias III in 172 B.C. to the death of Alcimus in 159 B.C. Neither, of course, can he be identified with either of the Maccabean brothers, Jonathan or Simon, or with John Hyrcanus, since Jonathan's successors would have inherited his enmity toward the Teacher. This focuses attention on the period 159–152 B.C. when, according to Josephus, "the city continued for seven years without a high priest" (*Ant* 20.10.3 §237). This can only mean that no one had been appointed officially. As a description of the real situation it is impossible, because the indispensable liturgy of the Day of Atonement demanded the participation of at least a *de facto* high priest. 2 Macc 10:38 attests the existence of such an individual (Murphy-O'Connor 1976). If his identification with Onias IV, who as the son of Onias III had the preeminent claim to the high priesthood, is impossible (Schürer *HJP²* 3/1: 145–47), then we must presume that the function of high priest was assumed by the leading member of the Temple hierarchy (Graetz 1884: 122). In the eyes of traditionalists such as the Essenes his legitimacy would have been unquestioned, and from a Jewish perspective the credit for the return to orthodoxy would have belonged to Jonathan (1QpHab 8:8–9; Murphy-O'Connor 1974: 230 n. 73), even though in reality the vacuum is explained by divisions among claimants to the Seleucid throne. In order to consolidate his power, however, Jonathan accepted the high priesthood in 152 B.C. when it was offered to him by Alexander Balas (1 Macc 10:15–20; Jos. *Ant* 13.2.2–3 §43–46). Thus he became the Wicked Priest, and the deposed *de facto* high priest joined the Essenes. Their demand for radical religious reform (CD 2:14–6:11) coincided with his own desires.

His presence quickly provoked a split within the Essene movement. The reasons are complex and not entirely clear. One factor was probably his assumption of the eschatological (but not messianic) role of "the one who teaches righteousness" predicted in CD 6:10–11 (Davies 1983: 123–24); this is the simplest explanation of his title, Teacher of Righteousness. The heightened sense of the imminence of the eschaton that this implies appears also in the movement of some Essenes to Qumran in fulfillment of Isa 40:3. 1QS 8–9 (minus 8:16–9:2) is the proposal for this project (Murphy-O'Connor 1969: 529–32; Knibb 1987: 127), and its attribution to the Teacher is adequately justified by 4QpPs[a] 3:15–16 and by the position he enjoyed within the Qumran group. Such initiatives may have been associated with an intensification of the rigorism of the Essene movement, since "the latter ordinances" (CD 20:9, 31–32) are probably additions by the Teacher to "the former ordinances" (1QS 9:10) by which the sect had hitherto been governed (Laperrousaz 1971).

Jonathan, the Wicked Priest, had first dismissed the Teacher as insignificant, but when it became known that he had acquired followers and moved to Qumran, he had to act against him because an eschatological movement was both a threat to his authority and a danger to the Jewish people at a critical moment in their history (1QpHab 9:9–10). Various attempts have been made to reconstruct what happened during the inconclusive encounter recorded in 1QpHab 11:4–7 (Jeremias 1963: 57; Stegemann 1971: 236; Talmon 1951), and the only one that is certainly wrong is Dupont-Sommer's (1950: 121–22) hypothesis that the Teacher was killed. It became the foundation of a bizarre interpretation of the Teacher's career, which was decisively refuted by Carmignac (1957).

At the beginning of Qumran studies there was a tendency to consider the Teacher the author of 1QS, 1QM, and 1QH (e.g. Carmignac and Guilbert 1961: 13, 86, 136). For the reasons noted above 1QS 8–9 is substantially the work of the Teacher, but nothing in 1QM suggests the attribution of any part to him. Scholars working independently and with different methods agree that the following hymns at least should be ascribed to the Teacher: 1QH 2:1–19; 4:5–29; 5:5–19; 5:20–6:36; l 7:6–25; and 8:4–40 (Becker

1963: 53; Jeremias 1963: 171; Kuhn 1966: 23). Despite certain hypercritical reserves (Schürer *HJP²*: 454), it is certain that these hymns are the work of a single author and the radical nature of his claims to be the ultimate religious authority (1QH 2:13; 5:22–23; 7:12; cf. CD 20:1) makes the Teacher the only plausible candidate (Schulz 1974). Attempts have been made to use the hymns to fill out the career of the Teacher (Carmignac 1960; Delcor 1962; Mansoor 1961: 45–49; Michaud 1956), but all specific biographical inferences are excluded by the fact that the texts is a tissue of OT citations and allusions. At most the hymns reveal the inner life of the Teacher (Jeremias 1963: 266). It has been suggested that the historical data in the *pesharim* concerning the Teacher were derived from the hymns (Davies 1987: 87–106), but this approach has not yet been adequately tested. See also MIQṢAT MAʿASE HATORAH (4QMMT).

TEACHINGS OF SILVANUS (NHC VII,*4*). A treatise from Nag Hammadi remarkable both for the fact that it is in the form of a wisdom writing and for the fact that it develops a theology closer to Catholic Christianity than to Gnosticism. Documents reused in the covers of the codex in which *Teach. Silv.* is found have dates from before 350 A.D., and some of the handwriting of the cartonnage may be dated as late as 360 A.D. The Coptic text (in the Sahidic dialect with admixtures of Achmimic and sub-Achmimic) is a translation from a Greek original. Theological affinities provide the only other evidence as to date and provenance. The name Silvanus may refer to the companion of Paul but little or nothing is made of the connection. The treatise need not be pseudonymous, however, since Silvanus was to become a common Christian name (Broek 1986: 18–19).

There is very little by way of coherent order to *Teach. Silv.*, and an outline of its contents is not very illuminating. Suffice it to say that the first half of the treatise (84,16–98,20) is dominated by ethical discussion and includes an interesting reflection on the "three races" or "three parts" of human nature and a striking rejection of any form of human friendship. The second half of the treatise (98,20–118,7) is preoccupied with questions about the nature of God and of Christ, although these are increasingly interrupted by ethical reflections as the writing draws to a close. *Teach. Silv.* leaves the impression of being a collection of diverse materials and probably represents the end product of a long literary development. In particular, the discussion of the nature of God and Christ in the second half looks as though it may once have been more unified than it now is.

The similarity between *Teach. Silv.* and Jewish Wisdom Literature is obvious, and reformulations of passages from the Wisdom of Solomon are particularly noteworthy. It is equally obvious that a more otherworldly atmosphere pervades *Teach. Silv.*, and that consequently a comparison between *Teach. Silv.* and the *Sentences of Sextus,* the *Parangelmata* of Clement of Alexandria, and the later collections of precepts for monastic purposes is appropriate. But *Teach. Silv.* occupies a place somewhere between these two worlds. On the one hand, *Teach. Silv.* is closer to late Jewish wisdom in its blending of classical Jewish forms (proverbs, admonitions, discourses), elements of the Stoic-Cynic diatribe, and the Hellenistic hymn; on the other hand, such materials are charged with deeper spiritual significance by *Teach. Silv.* and undergo subtle literary transformations under the impact of this intensification of traditional wisdom themes (Schoedel 1975).

It is not inaccurate to speak of Gnosticizing tendencies in *Teach. Silv.* Included here are the following: an emphasis on the transcendence of God; a view of Christ that makes much of his role as revealer; the apparent (though not fully certain) treatment of Christ's descent into the underworld as a descent into this world (103,28–104,14; Peel 1979); the reference to the "three races" of human beings and the devaluation of the "female" constituent of the human frame (92,10–93,24); an emphasis on the derivation of humanity's essence from God (93,26–27; 117,7–9); and a string of symbols and images having to do with ignorance, drunkenness, wild beasts, the bridal chamber, and so forth. It is probably significant for the literary history of *Teach. Silv.* that such elements predominate in the ethical sections of the treatise. Even there, however, they are not developed in characteristically gnostic ways. The "three races," for example, are dealt with as the "three parts" found in all human beings. There is in fact little here that could not also be illustrated from writers like Clement of Alexandria or Origen. At least in its present form, *Teach. Silv.* is clearly non-gnostic: God, the father of Jesus Christ, is the creator (114,30–115; cf. 112,37–113,30); and Christ is the incarnate Lord (101,22–102,7).

Indeed, even anti-gnostic sentiments are to be found in *Teach. Silv.* Thus gnostic views of the ignorance of the creator are rejected: "Let no one ever say that God is ignorant, for it is not right to place the demiurge of every creature in ignorance" (116,5–9). Mysterious revelation is suspect: "And he [the Adversary] casts spurious knowledge into your heart in the guise of mysterious words" (96,3–6). And in words reminiscent of anti-gnostic predecessors *Teach. Silv.* argues: "If we scarcely find things on earth, who will search for the things of heaven?" (112,5–8; cf. Schoedel 1984).

It is coherent with this that the bedrock of the philosophical language of *Teach. Silv.* can be designated as a mixture of Stoic ethical and anthropological terms and Platonic metaphysical conceptions such as is found also in Philo (Zandee 1974) and Clement of Alexandria (Zandee 1977). An especially interesting point is the description of God as the one who contains but is not contained (99,29–101,10)—a theme rooted in classical philosophy, developed at length by Philo, adapted by numerous Church Fathers and even some gnostics, decisively refined by Augustine, and handed on to the Western world through Gregory the Great and others (Frickel 1956; Schoedel 1972, 1980). Special links with Origenistic and post-Origenistic theology in *Teach. Silv.* is possible in the light of the treatment of certain biblical texts and the development of a number of theological themes (Broek 1986). Thus the application to the incarnation of the image of the sun shining on filth without being defiled by such contact (101,29–102,7) is otherwise known to us from Origen and his successors. And the view that Christ "is always the Son of the Father" (115,9–10) seems to presuppose a post-Origenist analysis of the relation between God and

Christ. One of the soteriological themes of *Teach. Silv.* suggests that the treatise may even move in the shadows of Athanasius (*De incarnatione verbi* 54.3): "He [Christ] who has exalted man became like God, not in order that he might bring God down to man, but that man might become like God" (111,8–13).

The ascetic cast of the ethic of *Teach. Silv.* and the use of the sapiential literary form made *Teach. Silv.* of special interest to proponents of the monastic movement. A passage akin to *Teach. Silv.* 97,3–98,22 in fact appears in two other sources where it is associated with the name of Antony the great desert hermit (Funk 1976). A common source may lie behind *Teach. Silv.* and Ps-Antony (Funk 1976: 18–19), or it may be that Ps-Antony drew on *Teach. Silv.* (Broek 1986: 23, n. 53). The advice given in the passage to avoid all human friendship no doubt owes something to a sharpened form of ascetic withdrawal from society, but it may also be another instance in which a rather unusual theme from classical Egyptian wisdom literature proved attractive to the monastic movement (Funk 1976: 20–21).

WILLIAM R. SCHOEDEL

TEBAH (PERSON) [Heb *ṭebaḥ* (טֶבַח)]. The firstborn son of Reumah, the concubine of Abraham's brother Nahor (Gen 22:24). The personal name Tebah would have meant something like " (born at the time [or place] of) a slaughtering." The man himself is said to have been the ancestral father of an Aramaean tribe and presumably founded the city of Tibhath (1 Chr 18:8; cf. 2 Sam 8:8, where *ṭbḥ* should be read instead of the erroneous *bṭḥ*). The town belonged to the empire of Hadadezer, the king of Aram-Zobah. King David of Israel took from Tibhath and brought to Jerusalem large supplies of bronze, which were used later in Solomon's construction. "Tebah" has been thought to be related to the place name *tubiḫi* of the Amarna letters and probably to *dbḫ* of Tuthmosis III's Palestine list. This city was likely located between Baalbek and Kadesh, in the Beqaʿ Valley between the Lebanon and Anti-Lebanon Mountains (*GTTOT* 333; *LBHG,* 171, 296).

EDWIN C. HOSTETTER

TEBALIAH (PERSON) [Heb *ṭĕbalyāhû* (טְבַלְיָהוּ)]. A gatekeeper in the temple at Jerusalem, Tebaliah is named in 1 Chr 26:11 as the third son of Hosah of the Levitical line of Merari. The list in which this name occurs may come from the Chronicler (Williamson *Chronicles* NCBC, 169) or from a later reviser of the Chronicler's arrangement of these temple functionaries (Rudolph *Chronikbücher* HAT, 173). The derivation of the name itself is a matter of some speculation. Noth (*IPN,* 244) found no

satisfactory possibilities for its meaning. If the root *ṭbl* is understood, then the meaning might be "Yahweh has dipped" or "purified" (BDB, 371). If, on the other hand, the initial element is understood to be derived from *ṭōb* (see Coogan 1976: 74–75), then the meaning might be "good for Yahweh" (see Rudolph *Chronikbücher* HAT, 170).

J. S. ROGERS

TEBETH [Heb *ṭēbēt* (טֵבֵת)]. The tenth month of the Hebrew calendar, corresponding roughly to December and January. See CALENDAR (ANCIENT ISRAELITE AND EARLY JEWISH).

TEFILLIN [Heb *tĕpīllîn* (תְּפִלִּין); *tĕpîlîn* (תְּפִילִין)]. See PHYLACTERIES.

TEHILLIM [Heb *tĕḥīllîm* (תְּחִלִּים)]. See PSALMS, BOOK OF.

TEHINNAH (PERSON) [Heb *tĕḥinnâ* (תְּחִנָּה)]. The father of Irnahash in the genealogy of Judah (1 Chr 4:12).

H. C. LO

TEKOA (PLACE) [Heb *tĕqôaʿ* (תְּקוֹעַ)]. TEKOITE. A town in the highlands of Judah (2 Chr 11:6). It is identified with Khirbet Tequʿa (M.R. 170115), ca 16 km S of Jerusalem at an altitude of 825 m. The site is located exactly on the border between arable land and the desert. E of it extends "the wilderness of Tekoa" (cf. 2 Chr 20:20). To the W there is a fertile area once known for its olive trees, as we know from Talmudic sources (*m. Menaḥ* 8,3). Perhaps the mentioning of Tekoa in Jer 6:1 refers to its location bordering the waste land, and thereby to the possibility of using the town as a refuge where the people of Jerusalem could "flee for safety" on the day of desolation. The Hebrew text of Joshua 15, giving an administrative division of the kingdom of Judah, does not mention Tekoa. The LXX though presents an additional district with Tekoa, Bethlehem, and some other towns (v 59b). If we interpret the genealogical lists in the beginning of 1 Chronicles correctly (especially 2:24; 4:5) Tekoa was founded as a result of a merging of people from the clan of Ephrathah at Bethlehem and Calebites from the Hebron area. This also seems perfectly logical, since the site is situated exactly between the areas of the two cities mentioned.

Tekoa appears a couple of times in the narratives of king David. One of David's heroes, Ira the son of Ikkesh, came from Tekoa (2 Sam 23:26). According to the Chronicler this Ira later served as officer in charge of a division of 24,000 men (1 Chr 27:9). It was also in this area that David gained support and laid the foundation for his further accession to the throne. When David's son Absalom after having killed his brother Amnon had fled abroad, Joab, the commander of the army, arranged a reconciliation between father and son by sending for a "wise woman" from Tekoa to talk to the king. This has led some scholars to suggest that "wisdom" had a particular association with Tekoa (Wolff *Joel and Amos* Hermeneia, 123). This is possible but by no means certain. Wise women do exist both here and there and everywhere. After the division of the monarchy we are told that king Rehoboam of Judah strengthened the fortifications of Tekoa along with some other cities in his little kingdom (2 Chr 11:5 ff.). It is quite possible that he did, but the list of fortified cities preserved here rather seems to derive from the time of Josiah (Keel and Küchler 1982: 733). The most prominent resident of Tekoa mentioned in the Bible was neither an army officer nor a wise woman but a prophet, the great Amos. Carrying out his ministry in the N kingdom he nevertheless was a southerner, probably a sheep breeder, from Tekoa. Indeed there have been assumptions that the Tekoa of Amos was situated in the N kingdom, but we are on the safer side relying on the traditional localization in Judah (see Wolff *Joel and Amos* Hermeneia, 123). It has been suggested that the sheep breeders of Tekoa, one of whom was Amos, were indeed cultic personnel, in charge of the temple flocks (see e.g. Kapelrud 1961: 5–7, 69), but we don't know of such an arrangement. The book of Nehemiah (3:5, 27) tells us that after the exile Tekoites restored sections of the city wall of Jerusalem. We

are also informed that their leaders were not very interested in the project, which may reflect the permanent conflict between city and countryside. During the Maccabean revolt ca. 160 B.C., Jonathan was operating in the wilderness of Tekoa (1 Macc 9:33) while Antiochus IV refortified the city (*Ant.* 13.15). During the Jewish wars in the 1st centuries C.E. Tekoa seems to have been in the hands of the Jewish rebels (*JW* 4.518; cf. Keel and Küchler 1982: 665). In Byzantine times Tekoa was a Christian town.

There are ruins of a Byzantine church in the site. The apse and the S wall are still discernible, as also parts of a floor mosaic. Ca. 50 m to the NE of the church we find a dubble cave probably originally a cistern, that seems to be the place honored since the 1st century C.E. as the grave of Amos. A built-up passage leads into the cave from the E. Fragments of walls indicate that a building, ca. 10 × 10 m, once stood above the cave. This was presumably the memorial building, the propheteion of Amos. The monastical life was flourishing in this area in the middle of the 1st Christian millennium. There were monks and monasteries in the vicinity of Tekoa, frequently representing rebellious and unorthodox tendencies in theological thinking, e.g. Monophysitism and Origenism. Some centuries later, in the days of the crusaders, Tekoa was a big village inhabited by Christians and Muslims. In later times the place has gradually lost its significance. Today sometimes bedouins dwell on the site. A couple of kilometers away from it we can find a little Arab village called Tequa as well as an Israeli settlement by the name "Tekoa."

LARS AXELSSON

TEL-ABIB (PLACE) [Heb *tel ʾābîb* (תֵּל אָבִיב)]. A place in Babylonia where a number of exiles from Judah dwelt (Ezek 3:15). This Tel-abib was on the bank or the vicinity of the canal Chebar. The name "Tel-abib" is only mentioned in Ezek 3:15, but the name of the river Chebar is mentioned six times in Ezekiel. The great river (or canal) flowed through the site of ancient Nippur and then entered again into the Euphrates. The site of Tel-abib has not yet been identified. Avi-Yonah (*MBA* map no. 163) considers Tel-abib, Tel-melah, Tel-harsha, Cherub, Addan, Immer, and Casiphia to be the villages of Jewish exiles on Chebar river near Nippur.

In the documents of Murashû and sons, the Babylonian trade and banking house, from the 5th century B.C., a number of Jewish names are found. This fact may confirm that the Jewish exiles had settled in this region. The Babylonian name *nār kabāri,* "kabaru river," which may be identified with the biblical Chebar is found on two contracts from the time of Artaxerxes I (464–424 B.C.).

The word "Chebar" is mentioned in relation to Ezekiel's vision and his residential home. Apparently Ezekiel returned to his home in the village called Tel-abib. Cherub (Ezra 2:59; Neh 7:61) may be another name for Tel-abib from the consideration that Ezekiel saw the vision of Cherubim on the bank of Chebar River near Tel-abib.

In the Akkadian language the expression *til abūbi,* "hill of ruins made by the Deluge," was commonly used from the Old Babylonian period on. For example, "May (Adad) turn his land into hills of ruins *(māssu ana tilli abūbim litêr)*" (CH 50: 79–80). If one tears up the citadel's foundation, it will become "like a hill of ruins *(til abūbi)*." When the Assyrian army destroyed and flattened the rebellious cities, those became like *til abūbi.* Tiglath-pileser III wrote, "I destroyed (them) like *til abūbi."* The Akkadian noun *abūbu* means "tidal wave; flood; the Deluge," but the biblical *mabbûl* "Deluge" is probably related to another Akkadian word *biblu* "flood" (a noun derived from the verb *abālu* "to carry off, sweep away"). A variant form of the same word *bibbulu* "flood" in Code of Hammurapi §45:43 is more similar to *mabbûl.* It is most likely that the Hebrew meaning of the name "Tel-abib," "hill of fresh ears of barley," is a modification of the Akkadian words *til abūbi,* "ruins by Deluge," similar to Jacob's changing the name of his son from Ben-oni to Ben-jamin (Gen 35:18).

YOSHITAKA KOBAYASHI

TEL-ASSAR (PLACE) [Heb *tĕla›śśār* (תְּלַאשָׁר)]. An Aramaean city inhabited by the people of Eden mentioned with Gozan, Haran, and Rezeph, situated on the middle Euphrates. It might have been a city of the kingdom of Eden, the House of Eden or *Bît Adini* in Akkadian inscriptions which lay between the river Balih and Euphrates.

The Hebrew transcriptions *tĕla›śśār* and *tĕlaśśār* are conglutinations of *tēl-›Aśśār* "Ruin-mound of ›Assar," which may probably be identified with the Akkadian *Til-Aššuri* which means "Ruined mound of Aššur," namely "Ruined mound destroyed by the Assyrian god Aššur." This name may be an alternative name for the destroyed Aramaean city of Til Barsip, modern Tell Aḥmar, on the E bank of the Euphrates. In 2 Kgs 19:12 and Isa 37:12 the Rabshakeh referred to it probably because he passed through the cities of Gozan, Haran, and Til Barsip. Even if Til Aššuri which is referred to in the annals of Tiglath-pileser III and Esarhaddon appears to lie near the Assyrian border with Elam, Tel-Assar inhabited by the people of Eden seems to lie in the kingdom of Eden on the middle Euphrates.

The kingdom of Eden was located between Assyria and Syria-Palestine. Barsip (*ANET*, 269), the capital city of the house of Eden, was conquered by Shalmaneser III. He "renamed it after himself" (Hallo 1960) and annexed Bit Adini to Assyria in 855 B.C. Afterward Amos denounced the house of Eden (Amos 1:5). It probably rebelled against Assyria, and in the 8th century B.C. it was destroyed.

Sennacherib, through his messengers, tried to convince Hezekiah to surrender. By enumerating the names of cities, he showed that the gods worshiped by the people of these places had been unable to deliver them from the power of the kings preceding him. See *MBA*, map nos. 127, 138, 146.

YOSHITAKA KOBAYASHI

TEL-HARSHA (PLACE) [Heb *tēl ḥaršā›* (תֵּל חַרְשָׁא)]. A Babylonian site from which a number of lay people who were unable to establish their genealogies to prove they were the descendants of Israelites came back to Jerusalem and Judah with Zerubbabel in 537 B.C. by the decree of Cyrus. The Jewish exiles were probably taken to several unpopulated ruin mounds based on the assertion that some of the names of the locations where they lived were preceded by the word *tēl* "ruin mound of …" (Ezra 2:59; Neh 7:61; 1 Esdr 5:36). There were 652 people who could not prove their Israelite ancestry: the sons of Delaiah, the sons of Tobiah, and the sons of Necoda who came up from Tel-melah, Tel-harsha, and other exilic villages.

If it is an Aramaic word, it means "ruined mound of the deaf (or dumb)," and also less probably "ruined mound of a sorcerer." There were also cities called Ḫaršu and Ḫaršaya, but its Akkadian meaning and the relation to Tel-harsha cannot be ascertained (*CAD* H, 115–16). Aharoni (*MBA*, map no. 163) considers that Tel-harsha was one of the villages for exiles on Chebar River near Nippur, such as Tel-abib, Tel-melah (Ezek 3:15; Ezra 2:59), but the location is not yet identified. See TEL-MELAH.

YOSHITAKA KOBAYASHI

TEL-MELAH (PLACE) [Heb *tēl melaḥ* (תֵּל מֶלַח)]. A place probably in Babylonia from which Jewish exiles returned to Judah, some of whom could not prove their Israelite lineage through their genealogies (Ezra 2:59; Neh 7:61; 1 Esdr 5:36 [RSV, Telmelah]).

The name means "the ruined mound of salt." Some consider that it was a ruined town which had been strewn with salt for purification of a site devoted for destruction (cf. Judg 9:45). The salt land is uninhabitable (Jer 17:6) and the Jewish exiles were probably deported to such a place. The soil of the site was probably too saline to produce crops.

According to Aharoni (*MBA*, map no. 163) the villages of the Jewish exiles on the Chebar River near Nippur are Tel-abib, Tel-melah, Tel-harsha, Casiphia and others (Ezek 3:15; Ezra 2:59; 8:17). However, the site is not yet identified. See TEL-HARSHA.

YOSHITAKA KOBAYASHI

TELAH (PERSON) [Heb *telaḥ* (תֶּלַח)]. A descendant of Ephraim and son of Resheph (1 Chr 7:25).

What the name Telah means is not apparent. It appears in a postexilic Ephraimite genealogy which is difficult to interpret. Clearly he is the son of Resheph, but the relationship of Resheph to the preceding names is not clear. See RESHEPH (PERSON). The general tenor of the list aims toward situating the descendants of Joseph in the area N of and including Bethel. *BHS* proposes reading Shutelah for Telah. Similarly, Curtis and Madsen (*Chronicles* ICC, 154) view Telah as possibly an abbreviation of Shutelah. In the present form of the text, Telah is in the sixth generation before Joshua.
JAMES M. KENNEDY

TELAIM (PLACE) [Heb *ṭĕlā᾽îm* (טְלָאִים)]. Var. TELEM. The site where Saul mustered his troops in preparation for an invasion into Amalekite territory (1 Sam 15:4). There has been a long history of confusion over the identity of this site. The LXX reads "Gilgal" in place of Telaim, a tradition followed by Josephus as well (*Ant* 6.7.2). This tradition is unlikely, even though Saul was known to frequent the shrine located at Gilgal. It is much more likely, given the Amalekite destination, that Telaim is to be identified with Telem, a settlement in the Negeb allotted to Judah (Josh 15:24). Scholars who read Telem in place of *mē᾽ôlam* (= "from ancient times," 1 Sam 27:8) or of Havilah (1 Sam 15:7) do so on conjectural grounds alone. The exact location is unknown.
ELMER H. DYCK

TELEILÂT EL-GHASSÛL. See GHASSUL, TULEILAT EL-.

TELEM (PERSON) [Heb *ṭelem* (טֶלֶם)]. One of the three gatekeepers among the returned exiles who married a foreign woman during the era of Ezra's mission (Ezra 10:24 and 1 Esdr 9:25 where LXX reads *tolbanēs*). Noth contends that the name is etymologically related to the Arabic *ẓalmun* and means "brightness," probably an expression of joy over the birth of the child (*IPN*, 223). The three-month investigation (Ezra 10:16–17) culminating in the list in which Telem's name appears produced only three names of gatekeepers, leading some to believe that the list only includes prominent members of the Temple staff. Telem's importance at the Temple, however, remains a mystery. While it seems probable that Telem divorced his foreign wife (note the prior oath taken by the people [Ezra 10:3–5] and the possibly generalizable v 19), that is not certain. The RSV follows 1 Esdr 9:36 in clearly stating that all on the list did indeed divorce their foreign wives and put away their children, but the Hebrew text of Ezra 44b is so corrupt that a definite translation is impossible, leaving the final outcome of the investigation in doubt.
JEFFREY A. FAGER

TELEM (PLACE) [Heb *ṭelem* (טֶלֶם)]. See TELAIM.

TELHARSHA (PLACE). See TEL-HARSHA.

TELL/TEL. In biblical and archaeological usage, a mound that has resulted from the depositions of successive layers of human occupation. Geographic names containing the element "tel" or "tell" are alphabetized under the second element of the name; for example: IRA, TEL; BEIT MIRSIM, TELL.

TELMELAH (PLACE) [Gk *Thermeleth* (Θερμελεθ)]. An alternate form of the name TEL-MELAH.

TEMA (PERSON) [Heb *têmā᾽* (תֵּימָא)]. One of the sons of Ishmael (Gen 25:15). As with many of the names in this chapter, the name "Tema" has Arabian elements, and is certainly to be connected with the prominent oasis city of Teima. See TEMA (PLACE).

TEMA (PLACE) [Heb *têmā᾽* (תֵּימָא); *tēmā᾽* (תֵּמָא)]. A city in N Arabia (Isa 21:14; Jer 25:23; Job 6:19). It was apparently associated with a "son of Ishmael" (Gen 25:15; 1 Chr 1:30).

D. Tema in the 1st Millennium B.C.

———

A. Name and Identification

The identity of biblical Tema with Tayma *(Taymâ᾽),* one of the major caravan oasis cities of N Arabia, has never been seriously doubted. The name of the city is rendered as *Te-e-me* (not accepted by Eph῾al 1982: 125, n. 437), *Te-ma, Te-ma-a* and *Te-ma-᾽* in Akkadian inscriptions from Sennacherib through the reign of Nabonidus. It is spelled *tym᾽* in Aramaic inscriptions from the city itself, and *tm᾽* in contemporary Thamudic texts from its vicinity. Both the Aramaic and the Thamudic references derive from the 5th or 4th centuries B.C. In Minaean, the name may once occur as *tymy.* The geographer Ptolemaeus from the 2d century A.D. mentions *Thaîma* (Knauf 1989: 80, 149).

The name cannot be interpreted with certainty. In its present form, it looks like a *fa῾la᾽*-formation from *TYM; taym* means "slave, servant" in Arabic. Alternatively, one may analyze the name as a formation with *ta*-prefix from *WMY.* Akkadian *wamā᾽um,* later *tamû (m),* Syriac *îmâ,* means "to swear an oath"; Qatabanian *wmy* could signify "confederates" (Müller 1963: 113). In this case, the name may elucidate the cultic and political centrality of the oasis for the surrounding tribes. Although one would expect a form like *Tawmâ᾽ if the name should indeed be derived from *WMY,* this explanation is not entirely impossible since we do not know how far the NW Semitic shift of *w-* to *y-* had, by the beginning of the 1st millennium B.C., penetrated into Arabia. The ethnic adjective formed from the city's name is *tymny* "Temanite" in Hebrew and Aramaic, and *taymâwî* in Arabic.

B. Location and Topographical Description

Tayma (27°38´N; 38°29´E) is strategically situated on the W edge of the N Arabian desert *(an-Nafûd),* where three important trade routes merge: (a) the "incense road," the main artery of traffic between S Arabia, Syria, and the Mediterranean, which follows the E escarpment of the W Arabian mountain ridge; (b) the connection between the "incense road" and Mesopotamia, which leads NNE from Tayma via Dumah (see DUMAH) to the Euphrates, and circles the N fringe of the Nafûd; and (c) the connection between the "incense road" and E Arabia and the Persian Gulf, which leads E from Tayma via Hâ᾽il to Gerrha (see HAGAR), skirting S of the Nafûd. The city is situated on the S border of a salt swamp *(sabkha).* The core of the settlement lies within the limits of the present oasis which today consists predominantly of mudbrick compounds and palm gardens. The view of ancient Tayma would probably not have been much different except for some more magnificent buildings; also, in antiquity the oasis extended to the NE and to the NW for 1–2 km beyond the present limits of cultivation. The whole ancient oasis was surrounded by a wall, most of whose course can still be traced. The wall includes an area of ca. 800 hectares (Edens and Bawden 1988: 52–54). Rocky hills overlooking the city from the S (Jabal Ġhunaym) contain rock drawings and Thamudic inscriptions of religious significance.

C. History of Exploration

From the late 19th century onwards, the city was visited by several explorers who described its visible monuments and recorded its inscriptions. The most important among these were C. Doughty in 1877 (Doughty 1936: 284–300, 517–65), C. Huber and J. Euting in 1884 (Euting 1914: 146–63, 198–207), H. St. J. B. Philby in 1951 (Philby 1957: 72–103), W. L. Reed and F. V. Winnett in 1962 (Winnett and Reed 1970: 22–37), and R. Stiehl in 1966 (Altheim and Stiehl 1968: 74–77; 1973: 243–53 with fig. 2–12). Archaeological surveys and soundings commenced in 1979 and are presently continued (Bawden et al. 1980; Livingstone et al. 1983; Abu-Duruk 1986).

D. Tema in the 1st Millennium B.C.

A small amount of "Midianite" pottery attests human presence at the oasis for the end of the 2d millennium B.C. (Bawden and Edens 1988: 209–11; Edens and Bawden 1988: 54–57; Parr 1988a: 76–81). As early as shortly after the middle of the 8th century B.C., Sabaean and Temanite caravans reached the Euphrates in the vicinity of ᾽Ana. See SHUAH. When the participants in the commerce on the incense

road paid tribute to Tiglath-pileser III in 734 B.C., so did Tema (Knauf 1989: 3–4, n. 16, 138). Tema's close cooperation with the Sabaeans who controlled the incense trade from the 8th through the 5th centuries B.C. is attested by Job 6:19. It can also be argued that the local N Arabic script, "Tayma-Thamudic" or "Taymanite," is derived from Sabaic writing (von Wissmann 1976: 355, n. 89).

Around 600 B.C. Tema and Dedan were the two major urban centers of N Arabia (Jer 25:23; Knauf 1989: 103f.). In 553/552, the Babylonian king Nabonidus marched into N Arabia via Edom and made Tema his headquarters during his ten years' sojourn in N Arabia (Beaulieu 1985). Nabonidus' march of conquest is reflected in Isa 21:12–17 (Galling 1963; Lindsay 1976). During the 5th century, the city reached the peak of its prosperity (Bawden and Edens 1988; Edens and Bawden 1988; Parr 1988b). It remained the metropolis of N Arabia under Persian rule, and most probably was the seat of a Persian governor (Knauf 1990). Its trade and cultural relations to Mesopotamia, Egypt, and various parts of N Arabia are reflected in the Aramaic inscriptions, the names and places of origins of the city's gods, and the iconography of the reliefs accompanying the inscriptions (Dalley 1986; Knauf 1989: 150–52; 1990). When, around 400 B.C., the Minaeans expelled the Sabaeans from the incense trade, Tema lost its preeminence to Dedan. In the course of the 1st century B.C., the town was incorporated into the Nabataean realm (Wenning 1987: 116–17).

ERNST AXEL KNAUF

TEMAH (PERSON) [Heb *tāmaḥ* (תָּמַח)]. The name of a family of temple servants who returned to Palestine with Zerubbabel shortly after 538 B.C.E., the end of the Babylonian exile. The name appears in Ezra 2:53 in the phrase "the sons of Temah" (Gk *thema*), where the temple servants are distinguished from the people of Israel, the priests, and the Levites. The parallel verse Neh 7:55 (Gk *thēma/ēmath*) and the later parallel 1 Esdr 5:32 (Gk *thomoi/thom (e)ei/thomthei*) also list "the sons of Temah."

STEVEN R. SWANSON

TEMAN (PERSON) [Heb *têmān* (תֵּימָן)]. The firstborn son of Eliphaz, the most prominent of the tribes of Edom (Gen 36:11). It seems that the Edomite tribes were basically regional organizations; names of Edomite tribes have survived into the present toponymy of the region. See also FEINAN, WADI; ZERAH. The references to Teman in Gen 36:15, 42 are dependent upon 36:11 (Weippert 1971: 437–46).

Teman is a geographical designation from the root *ymn* with *t*-prefix; it signifies "south" in general (e.g., Exod 26:18). As a toponym, Teman refers either to Edom, the southernmost Canaanite state in the first half of the 1st millennium B.C., or to a part of Edom. In Amos 1:12, the fire that Yahweh is going to hurl on Teman will consume the palaces of Bozrah. It seems, then, that Teman was the name of the N part of Edom whose capital was located at Bozrah (Buṣeirah; M.R. 208016). Ezek 25:13 threatens the Edomites "from Teman to Dedan," i.e., from the northern to the southern borders of their realm at the beginning of the 6th century B.C. (Knauf 1983; 1985: 250). In Jer 49:7, 20, and Obadiah 9, Teman is used as a synonym for Edom. If Teman was the name of the region surrounding Bozrah/Buṣeirah, the capital of Edom, this broadening of the term's meaning becomes intelligible. This was the region where the Edomite state began to form in the 9th century B.C. and from where it penetrated farther S in the following centuries.

It is clear from all these references, that Teman designated a region and, secondarily, a tribe (de Vaux 1969). The identification of the archaeological site of Tawilan near Petra (Glueck 1935: 82f.) with Edomite Teman is untenable both in terms of linguistics and philology.

Since the classification of an Edomite as an Edomite would not make much sense, the "land of the Temanite," which was the origin of the Edomite "king" Husham (Gen 36:34 ; 1 Chr 1:45), does not refer to Teman, but to Taima in N Arabia. See also HUSHAM. It cannot be decided whether Job's friend Eliphaz the Temanite (Job 2:11; 4:1; 15:1; 22:1; 42:7, 9) was thought to have come from Edom or Taima (Knauf 1983: 25). His personal name may allude to the Edomite tribe of Eliphaz (Weippert 1971: 246).

"Yahweh of Teman" is attested in the ostraca from Kuntillet ʿAjrud (Emerton 1982). It is unclear, whether this Teman refers to the Edomite region, or to "South, Country of the South" in general. Authors who look for the origin of the God Yahweh in Edom would tend to argue for the first option (Ahlström 1986: 58); those who assume Yahweh's homeland to have been located farther S would choose the second one (Knauf 1988). The same ambiguity applies to Hab 3:3.

A settlement *Thaiman* in S Transjordan is attested for the 3d and 4th centuries A.D. by Eusebius and St. Jerome (*Onomast.* 96:19–21; 97:15–17). Their locations, however, vary (5 or 15 miles N of Petra?); therefore, the place still remains unidentified (Weippert 1971: 422).

ERNST AXEL KNAUF

TEMANITE [Heb *têmānî* (תֵּימָנִי)]. An ethnic designation in the OT. A Temanite is either a person from Teman or from Tema. See also TEMA and TEMAN. Teman refers to "the south" in general and to Edom specifically; accordingly, a Temanite is a "southerner," or an Edomite. As for the Edomite "king" Husham, who came from "the country of the Temanite," or "Temanites" (Gen 36:34; 1 Chr 1:45), a possible origin in the Tema area has been proposed. See HUSHAM. Job's friend Eliphaz (Job 2:11; 4:1; 15:1; 22:1; 42:7, 9) may have been at home in either Tema or Edom. See also ELIPHAZ;

NAAMATHITE; SHUAH; UZ. Temni in 1 Chr 4:6 (a proper name) seems to refer to an Idumaean clan incorporated into the statistics of the tribe of Judah. See also HUR; SHOBAL; MENUHOTH.
ERNST AXEL KNAUF

TEMENI (PERSON) [Heb *têmĕnî* (תֵּימְנִי)]. One of the sons of Ashhur, a descendant of Judah (1 Chr 4:6). His name indicates that he was a southerner.
H. C. LO

TEMPLE OF OLYMPIAN ZEUS. See OLYMPIAN ZEUS, TEMPLE OF.

TEMPLE SCROLL. A scroll emanating from Qumran Cave 11 (hence its designation 11QTemple; Heb *Megillat Hammiqdaš*) which sets forth the author/redactor's plan for a perfect society, cult, and government of the Jewish people in the land of Israel.

A. Discovery

The *Temple Scroll* was first brought to the attention of the late Yigael Yadin by Joseph Uhrig, a Virginia minister, in 1960 who said it was in the hands of a Jordanian antiquities dealer (Shanks 1987). After two years of negotiations, Yadin had little more to show than a small fragment proffered as a sample, and he gave up hope of recovering the scroll. In the aftermath of the Six Day War in 1967, Yadin was able to locate the antiquities dealer and the scroll which was eventually purchased for the Shrine of the Book in Jerusalem (Yadin 1983, 1: 1–5).

B. Description and Paleography

The scroll was in poor condition. It had been kept under the floor of the antiquities dealer's home in a shoebox. In addition, other fragments were in a cigarbox, and some had been hidden elsewhere. The task of unrolling the scroll and placing the fragments in order was made even more difficult because the writing of some columns was preserved only on the back of the preceding column. The upper edge had been severely damaged by dampness, either in antiquity or in the care of the antiquities dealer.

The scroll consists of 19 sheets, each containing 3–4 columns. Adding space for the damaged beginning, the entire scroll would have been approximately 8.75 m, making it the longest of the preserved scrolls (1QIsa^{a} is 7.34 m). It is written in two hands, one scribe writing cols. 1–5 and another (with some overlap of text) the remainder of the scroll. Yadin (1983, 1: 12) suggests that the scribe of the first part of the scroll repaired the scroll by rewriting the first part which had become worn through use. The scribal techniques and script are typical of the other Qumran manuscripts. While the language of the scroll has much in common with the dialect in which the sectarian compositions from Qumran are written, in certain linguistic features and in its legal terminology, it exhibits more affinities to rabbinic Hebrew than do the other scrolls (Schiffman 1980).

The *Temple Scroll* is also known from other manuscripts. These other manuscripts are extant only in fragments and some have been used in restoring parts of the text. Yadin (1983, 1: 17) identified the script of the two scribes of 11QTemple as Herodian, dating to around the turn of the era. He also discussed two fragments, dating Rockefeller 43.975 to the Herodian period but 43.366 to the Hasmonean, from the end of the 2d century B.C.E. J. Strugnell (in Wacholder 1983: 205–6), having examined the manuscripts at the Rockefeller Museum, writes that 43.366 belongs not to a manuscript of the *Temple Scroll* but rather to a Pentateuch with supplementary additions. Further, Strugnell calls attention to a group of Cave 4 fragments which quote the *Temple Scroll* or one of its sources and which he dates no later than ca. 150 B.C.E. A few fragments from Cave 11 are also awaiting publication.

C. Contents

The scroll presents itself as a rewritten Torah which begins with the renewal of the Sinaitic covenant in Exodus 34 and then turns to the building of the temple in Exodus 35. From this point, the scroll continues in the order of the canonical Torah, covering the basic structures of the sanctuary and its courts, the sacrificial system, the various other Temple rituals, laws of ritual purity and impurity, and finally a long series of Deuteronomic prescriptions, including a distinct section on the king, the government, and the army. The scroll concludes with the laws of consanguineous marriages.

11QTemple 29:2–10 indicates clearly that the purpose of the *Temple Scroll* was to provide a system of law for the pre-messianic temple. This temple, it was expected, would be replaced in the end of days with a divinely created sanctuary. Until then, the author/redactor saw his scroll as representing the correct interpretation of the Torah.

The scroll does not simply recapitulate the prescriptions of Exodus, Leviticus, Numbers, and Deuteronomy. It collects together the various pentateuchal (and sometimes prophetic) material relevant to the issue at hand and weaves together a unified, consistent text. In this respect it can be said that the text redacts the Torah, combining all materials on a single topic together. In many cases, statements in the canonical Torah referring to God in the 3d person are shifted into 1st-person-divine direct address. In this way the intermediacy of Moses is eliminated and the contents of the scroll are presented as the direct revelation of God to Israel at Mt. Sinai.

Yet the scroll goes further. It uses a distinct form of exegesis, in some ways similar to the midrash of the later rabbis, to reconcile the differences between the various pentateuchal texts so as to create a unified and consistent whole. At times, it makes minor additions to clarify its legal stance. In a few places, extensive passages appear which are not based on our canonical Scriptures. In this way the scroll propounds its own views on the major issues of Jewish law relating to Temple, cult, government, and sanctity. It is this exegetical and legal approach which makes the *Temple Scroll* so central for the history of Jewish law and midrashic exegesis, and for understanding the sects of the Second Temple period.

The laws of the scroll include a number of provisions of great interest. The architecture of the temple proposed here differs from biblical accounts, on which the author claims to base himself, as well as from descriptions of the Second Temple in Josephus and the Mishnah. Most interesting is the extension of the *temenos* (the "Temple City") by the addition of a 3d courtyard, so large that it would have encompassed most of what was then Jerusalem. The courtyards and their gates represent the Israelite encampment in the wilderness. Unique approaches appear here for the construction of the temple furnishings. The sacrificial festival calendar includes a number of festivals not part of the biblical or rabbinic cycle. A second New Year festival is to be celebrated on the first of Nisan, in the spring, followed by annual celebration of the eight days of ordination. Besides the Omer festival for the barley harvest (the 2d day of Passover) and the first fruits of wheat (Shavuot), the scroll adds two more first-fruits festivals, each at 50-day intervals, for oil and wine. The wood offering is also celebrated as an annual festival in the summer. Extensive laws deal with the sacrificial procedure and ritual purity and impurity. Here we see a general tendency to provide additional ways to protect the sanctuary from impurity. This brief survey does not even begin to indicate the rich nature of the scroll's exegesis and the many details of Jewish law in which the text diverges from the views of other sectarian documents or rabbinic literature.

D. Sources

Even in its present form, it is not difficult to discern that the *Temple Scroll* has been redacted from a number of sources by an author/redactor. His sources most certainly included the sacrificial festival calendar (11QTemple 13:9–29:1) and the law of the king and army (56:12–59:21). It has also been suggested that the description of the temple precincts and furnishings (2:1–47:18, *passim*) and the laws of purity (48:1–51:10) constituted separate sources (Wilson and Wills 1982). It was the author/redactor who added the Deuteronomic paraphrase at the end (51:11–56:21, 60:1–66:17).

E. Dating

Rockefeller 43.366, taken by Yadin as the earliest manuscript of the *Temple Scroll*, led him to date the scroll to no later than the reign of John Hyrcanus (134–104 B.C.E.) or Alexander Jannaeus (103–76 B.C.E.). Yet, as already noted, this is not actually a manuscript of our scroll.

All sources now included in the scroll presuppose the existence of a canonical Torah differing from MT only in minor details (contrast Stegemann 1988: 246–56). Only a few legal rulings can be shown to derive from variant biblical texts. For this reason the scroll had to have been completed after the period of the return (ca. late 6th to mid-5th centuries B.C.E.). Further, all manuscripts of the *Temple Scroll* identified thus far are of Herodian date, although it is possible that a source of the scroll was extant by 150 B.C.E. It is within these parameters that we must seek both a dating and a *Sitz im Leben* for the scroll.

More specific dating must take into account the particular regulations of the law of the king which is the largest sustained non-pentateuchal section. This text provides the clearest indications of date in the scroll. It emphasizes the separation of roles of the high priest and king and the need to constitute the *gerousia* so that it would consist of twelve each of priests, Levites, and Israelites. It argues against the use of mercenaries which were used extensively by John Hyrcanus. The *Temple Scroll* requires that the king have a special palace guard to protect him against kidnap. Here we have an illusion to the perfidious kidnap and murder of Jonathan the Hasmonean in 143 B.C.E. (cf. 1 Macc 13:24). The text further polemicizes against campaigns such as those of John Hyrcanus and Alexander Jannaeus when it prohibits wars with Egypt for the sake of accumulating wealth.

Since the law of the king is incorporated into the fully redacted scroll, it is therefore appropriate to date the scroll as a whole to no later than the second half of the reign of John Hyrcanus (Schiffman 1987; Yadin [1983, 1: 386–90] dates the scroll to the reign of Hyrcanus or slightly earlier; Hengel, Charlesworth, and Mendels [1986] date the scroll to 103–88 B.C.E.). At this time, the author/redactor called for a thoroughgoing revision of the existing Hasmonean order, desiring to replace it with a Temple, sacrificial system, and government which was in his view the embodiment of the legislation of the Torah. This dating is fully consistent with the paleographic data described above.

F. Relation to Other Qumran Documents

In his initial study of the *Temple Scroll,* Yadin assumed that it, like the rest of the Qumran corpus, represented a text of Essene provenance. Accordingly, he interpreted the scroll to agree with the previously known Dead Sea sectarian texts and Philo and Josephus' description of the Essenes. Many scholars have followed this lead. Others have pointed to the absence of the usual Qumran polemical language and distinctive terminology, and the lack of some characteristic linguistic features in these texts (Levine 1978 [and the responses of Milgrom 1978 and Yadin 1980]; Stegemann 1988: 237–46; Schiffman 1983: 13–17). Further, this text has a different view of the origins, authority and derivation of Jewish law. Whereas the sectarian texts from Qumran generally expect the law to be derived by inspired biblical exegesis from the canonical Torah, the *Temple Scroll* sees extrabiblical laws as stemming from the Sinai revelation as an actual Torah. Some recent scholarship now sees the *Temple Scroll* as emerging from a related group which was either contemporary with or earlier than the previously known Qumran sect. Still to be investigated are the unpublished Torah scrolls with supplementary material which at some points seem to underlie the *Temple Scroll.*

There is an even closer link between the *Temple Scroll* and the *Miqsat Ma*ʿ*aseh Ha-Torah* (4QMMT). This "halakhic letter" describes a series of laws over which the authors disputed with the established authorities of the Jerusalem priesthood. The 4QMMT claims that due to disagreements with the Jerusalem establishment its authors left Jerusalem and forswore worship in its temple (Qimron and Strugnell 1985). It is most likely that this letter dates to the origin of the Qumran community. In general, 4QMMT takes positions equivalent to those of the Sadducees in rabbinic literature and ascribes to the Jerusalem priests views identified as Pharisaic. In many cases, this text's rulings agree with those of the *Temple Scroll.* This new evidence suggests that the *Temple Scroll* stems from forerunners of the sect who shared Sadducean rulings on many matters. See also MIQṢAT MAʿASE HATORAH (4QMMT).

G. Significance

This scroll is the largest of the Dead Sea Scrolls and for this reason alone it vastly enriches the textual remains of Second Temple Judaism. This text shows that the exegesis of Scripture for the derivation of Jewish law, the activity which the later Rabbis called midrash, was already a central part of the Judaism of some groups in the Hasmonean period. This exegesis served as the basis for highly developed legal teachings which are evidence that among some groups of Second Temple Jews strict adherence to a living and developing tradition of Jewish law was the norm. Further, some of these Jews objected strenuously to the conduct of the Hasmoneans in both the religious and political/military spheres. These opponents were at the forefront of the movement represented by the Qumran sect. Among the texts they brought with them to Qumran were the sources of the *Temple Scroll.*

LAWRENCE H. SCHIFFMAN

TEMPLE, JERUSALEM. Although not a trace of any phase of the temple building in Jerusalem seems to have survived to the present day, the Jerusalem Temple holds a place of great prominence in the architectural history of the Western world. No other building of the ancient world, either while it stood in Jerusalem or in the millennia since its final destruction, has been the focus of so much attention throughout the ages. Such attention has taken the form of the prayers and pilgrimages of the faithful, the discussions and deliberations of the postbiblical sages, and, in recent centuries, the incessant explorations, excavations, and expositions by the scholarly community.

A. Introduction

The architectural entity known as the Jerusalem Temple was a complex institution. It played a central religious and cultic role in Israelite life. It also was an expression of the artistic and aesthetic standards of Near Eastern antiquity. In addition, and in relation to its religious and artistic value, it functioned on a political level. It contributed to the authentication, first, of the national state of which Jerusalem was the

capital during the preexilic period, then of the semiautonomous community of Judeans after the exile, and finally of the Jews who continued to live in Jerusalem and the surrounding territory, with sporadic periods of autonomy, in the centuries before its final destruction.

The history of this building thus extends from the origins of the monarchy in the 10th century B.C.E., when it was constructed by King Solomon, until the capture of Jerusalem by the Romans in 70 C.E. However, this millennium-long period did not entail the continuous existence of the original structure. A major rebuilding effort, nearly from the ground up, took place after the Exile, beginning in 520 B.C.E., after nearly seventy years of desolation in the wake of the Babylonian conquest of Jerusalem in 587. A second, enormous rebuilding effort took place near the very end of the Temple's history, when King Herod included the Jerusalem edifice among the extensive building projects that characterized his reign (37 to 4 B.C.E.). Although the early and late postexilic temples were in many senses continuations of the first temple building, they were also new buildings, exemplifying the techniques and styles of their own periods.

Consequently, the term Jerusalem Temple can designate one or all of these three distinct yet related buildings. The first is usually called the Solomonic Temple, because of Solomon's role in the building project; it is also called the First Temple. The next building is designated the Second Temple or sometimes Zerubbabel's Temple, in recognition of the chief political officer in the Persian province of Yehud (Judea) at the time of the reconstruction efforts of the late 6th century B.C.E. The third structure, while technically existing during the period known as the Second Temple period (515 B.C.E. to 70 C.E.), was in fact a new and grandiose edifice and is generally referred to as the Herodian Temple.

This division of the architectural history of the Jerusalem Temple into three major stages does not represent the only periods of change or renewal during the building's existence. Except for the Herodian Temple, which was completed only shortly before its destruction, the first two edifices underwent periodic renovations and alterations, both in structural features and also in the elaborate appurtenances associated with the cultic practices that took place in the Temple and its courts. These changes, which can often be linked to shifts in the political climate of Jerusalem as an administrative center, point to the political as well as religious functions of this series of monumental buildings.

Unlike religious structures or institutions in today's Western world, which are usually seen as functioning apart from institutions of political power, the Jerusalem Temple, like that of other temple buildings in the ANE, was inextricably linked to political rule. Furthermore, although it has been customary to project onto the Jerusalem Temple our contemporary experiences with religious architecture as places of worship for the community of the faithful, the Temple like its ancient counterparts played a somewhat different religious role. The temple building itself was not a place of public gathering and prayer, although its courtyards were the scene of such activity. Rather, the Temple in conception was a dwelling place on earth for the deity of ancient Israel and in this way, too, was fundamentally different from the religious buildings (synagogue, church, mosque) of postbiblical times.

B. Terminology

The English word "temple," as used to denote the central religious building in Jerusalem, comes from a Latin word (*templum*). In English translations, "temple" is used to translate the Hebrew word *hêkāl,* which is used in the phrase *hêkāl Yahweh.* The word *hêkāl* is related to similar terms in Ugaritic and Canaanite and is based on the Akkadian word *ekallu.* The Akkadian in turn comes from Sumerian *ê-gal,* meaning "great house." The connotation of this etymology is that a temple is a large building, or palace. It signifies a residence; and when used with the name of the deity, it indicates that the building is conceived of as a residence for that deity.

With respect to the Jerusalem Temple itself, the term *hêkāl,* when used with the definite article, is the same as the term for the major interior space (RSV "nave") of the building. This fact has led some scholars (e.g., Albright *ARI*) to suggest that the early Canaanite temples, of which the Jerusalem Temple is a development, consisted of one major chamber, the name of which thus designated the entire building. In the ongoing architectural tradition, rooms were added but the name of the largest interior space continued, *pars pro toto,* to represent the whole structure.

In biblical terminology, the noun *hêkāl* can be a non-sacral term referring to any palatial dwelling (such as Ahab's palace, 1 Kgs 21:1; or that of the Babylonian king, 2 Kgs 20:18 = Isa 39:7; or that of the Phoenicians, Joel 3:5—Eng 4:5), although royal palaces are usually called *bêt hammelek,* "house of the king." Its use for Yahweh's dwelling includes references to pre-Solomonic structures, notably the shrine at Shiloh (1 Sam 1:9; 3:3), as well as to the heavenly abode of God, where Yahweh is envisioned as enthroned in his holy habitation (e.g., Isa 6:1; 2 Sam 22:7 = Ps 18:7; Ps 11:7). Only rarely is Solomon's Temple called by this term: twice in 2 Kings (23:4; 24:13); several times in Jeremiah (7:4; 24:1; 50:28; 51:11); and three times in 2 Chronicles (26:16; 27:2; 29:16). Postexilic biblical sources, however, do use *hêkāl* as a general designation for Zerubbabel's Temple.

Although the use of *hêkāl* is significant in pointing to the conceptualization of the Temple as a dwelling place, another biblical term is more common in reference to the Temple and likewise indicates the residential nature of the building. The basic term for temple in the Hebrew Bible is *bêt Yahweh* or *bêt ʾĕlōhîm,* "house of Yahweh" or "house of God." These terms are used in the Bible for Solomon's Temple (as in 1 Kgs 7:12, 40, 45, 51; 1 Chr 9:11, 13, 26) and for the postexilic temple (e.g., Zech 8:9; Neh 6:10). They are also found in reference to Yahweh shrines located outside Jerusalem (e.g., Judg 19:18; 2 Sam 12:20).

The other major national shrine of ancient Israel, the Tabernacle, apparently was a portable structure and is associated with the premonarchic tribal period of Israelite history. Its character as a non-permanent tent gave rise to a pair of appellations for its successor structure, the Jerusalem Temple: "tent" (*ʾōhel*) and "tabernacles" (*mišk*ā*nôt,* only in the plural). These terms appear only in the book of Psalms (e.g., 15:1; 43:3). Several less common terms also reflect a temporary structure. The noun *nāweh,* which indicates the abode of flocks or shepherds, is applied to the earthly temple, usually poetically (e.g., Isa 33:20), or to God's heavenly abode (as in Exod 15:13), which is the prototype for the divine dwelling-place on earth.

A similar occurrence, in which the Jerusalem Temple is conceived of as the place where Yahweh "sits"—as in the heavenly temple, Exod 15:17—is the use of *mākôn lĕšibtô* in 1 Kgs 8:13. This verse also includes the designation "lofty house" (*bêt zĕbûl*). Both of these terms may reflect stereotypical language drawn from Canaanite mythology (Haran 1978: 14). Somewhat less rare is the appearance of *māʿon* or *mĕʿônāh,* meaning refuge or lair and thus "habitation." Used alone or in construct with "house" or "holiness," these words can denote either God's heavenly dwelling (as in Jer 25:30) or earthly abode, the latter being the Jerusalem Temple (Ps 26:8).

One other word in the Hebrew Bible associated with the Jerusalem Temple is *miqdāš,* which is usually translated "sanctuary" or "shrine" by lexicons and dictionaries. This term can actually refer to anything, object or place, possessing sanctity. It can even designate the whole order of sacred acts to be carried out by the priests (as Lev 19:30, "you shall keep my sabbaths and venerate my *miqdāš*"; so Haran 1978: 15). More typically it refers to a sacred structure, such as the Tabernacle and its precincts (Exod 25:8, etc.), non-Jerusalem shrines (as at Shechem, Josh 24:26, and in the N kingdom, Amos 7:9), and the temples of non-Israelites (as a Moabite shrine, Isa 16:12, or Tyrian shrines, Ezek 28:18).

As a designation for the Jerusalem Temple, *miqdāš* came to be used generally for the entire sacred area of the Temple and its precincts, that is, the building itself and the series of courtyards surrounding it. This inclusive usage is especially true in Ezekiel (see, e.g., Ezek 44:1). But the term can also be found as a designation for the temple building itself, as in Ps 74:7, "They have burned thy sanctuary with fire." One late biblical passage, 2 Chr 36:7, uses the phrase *bêt miqdāš,* "house of holiness." This designation, in the form (*bêt hammiqdāš*), becomes the most common term for the Jerusalem Temple in postbiblical Hebrew literature (in the Mishnah, e.g., *Maʿas. Š.* 5:2, and the Tosefta, e.g., *Ber.* 3:16).

The NT references to the Jerusalem Temple, largely to the third or Herodian building, are numerous but employ only two different Greek terms. The word *naos* designates the temple building itself, and *hieron* indicates the sacred compound in its entirety. Both these words are commonly rendered "temple" in English translations.

C. Sources

Information about the various structures located in Jerusalem and referred to as the Temple comes from two major sources: ancient texts, both biblical and extrabiblical; and archaeological materials.

1. Literary. The Temple is mentioned, directly or indirectly, in many different places throughout the Hebrew Bible, in over half of the biblical books (according to the enumeration in Christian Bibles). In addition, eleven different NT books refer to the Temple. However, the major source for our knowledge of the Temple is the elaborate description—a veritable blueprint in words—contained in 1 Kings 6–8 and its parallel account in 2 Chronicles 2–4. These chapters provide a wealth of detail and are particularly valuable because they appear to be texts derived from records of the Temple's construction.

These temple texts deal specifically with the First Temple, as do the many references in Ezekiel. However, the testimony of Ezekiel is problematic. For one thing, it postdates the destruction of the First Temple and thus can provide information only about the last years of that building's existence, by which time the Temple may have been significantly different from the structure erected during Solomon's reign. Furthermore, much of the book of Ezekiel is cast in a visionary mode, in which reality and fantasy intermingle; such literary materials are not entirely reliable as historical witness. Similarly, some references to the Temple in postexilic sources, such as Haggai and First Zechariah, predate the completion of the Zerubbabel Temple and hence might contain impressions based on memories of the First Temple. But again, such reminiscences would reflect only the last days of that building. Also, in the case of First Zechariah, the temple passages are part of visionary scenes that are rooted in reality but go beyond the real.

In addition to the major sections of Kings and Chronicles that portray the construction of the Solomonic Temple, other scattered verses in these historical books mention it. Mainly, they serve to indicate the changes that were made in the original Solomonic building over the centuries between its construction and its destruction. As such, these references (see below) reveal that the Temple was not a static architectural entity. The fact that there are major differences between the Kings account, for example, and the passages in Ezekiel may be, in part, a result of the visionary character of the prophet. Yet, such differences are also the consequence of the substantial alterations that were made in the Temple's form and contents by various rulers between the reigns of Solomon and Jehoiachin. A case in point is the altar of the inner court, which is not mentioned in the Kings passage but which is found in the Chronicles version (2 Chr 4:1) and which is presented in detail by Ezekiel (40:47; 43:13–17). Conversely, the great "sea" is absent in Ezekiel but present in the other two main accounts.

Although not dealing directly with the Temple, the prescriptive and descriptive accounts of the construction of the Tabernacle are relevant to the accounts of temple building. See TABERNACLE. The final form of those priestly accounts, found in Exodus 25–30 and 35–39, may date to the exilic or postexilic period. But at least some of the materials come from the earliest period of Israelite existence. Some scholars (notably Haran 1978) have argued that the Tabernacle, with its appurtenances, personnel, and cultic acts, reflects conditions in the latter part of First Temple period.

The specificity of detail in all the temple accounts as well as in the tabernacle texts is a great boon to the scholarly task of reconstructing what the building looked like in antiquity, in its various phases. At the same time, the technical nature of the vocabulary that is involved sometimes makes it very difficult, if not impossible, to understand what is being portrayed. Many of the architectural or construction terms are lexically rare, and hence their exact meaning cannot readily be determined. Furthermore, the ancient versions often provide little assistance in such cases. Both the technology and the architectural and decorative fashions had changed sufficiently by the time of the earliest translations so that accurate renderings by the ancients was not always achieved.

The construction of the Second Temple under the governorship of Zerubbabel is heralded in Haggai and First Zechariah, and it is referred to by both Ezra and Nehemiah and by the Chronicler at the very end of 2 Chronicles. None of these accounts attempt to provide a description of the edifice itself; they are more concerned with the difficulty of bringing the building project to fruition and with the political and economic aspects of the construction work. Any references to the dimensions or quality of the rebuilt sanctuary are incidental (as Ezra 6:3) and probably incomplete; their reliability as witnesses to the

building as it existed is thus questionable. The few references in Daniel (7:25; 8:11–13; 9:24–27) are pre-Herodian but deal with the desecrations of the Temple by the Syrians and tell little about the building itself.

The Second Temple survived for nearly a hundred years longer than did the Solomonic Temple. The latter part of its existence, at the end of the period witnessed by the canon of the Hebrew Bible, was thus within the time frame that saw the production of extrabiblical materials that have survived. Many of these works contain information about the Temple. Some of them are pre-Herodian; others are somewhat later but apparently contain reliable materials concerning the last stages of the Zerubbabel building. Most of these sources, however, like their biblical forebears or counterparts, are not comprehensive architectural descriptions. The technical data provided are random. However, the historical information about the changes that were made, while perhaps incomplete, is nonetheless valuable in attesting to the ongoing series of renovations that characterized the Zerubbabel structure as well as that of Solomon.

These extrabiblical sources include several apocryphal and pseudepigraphical books, namely 1 Esdras, Ecclesiasticus, and 1 Maccabees. The material in 1 Maccabees, by virtue of that book's concern with the Syrian control of Jerusalem, provides some details about the Temple. Another source, the *Letter of Aristeas,* is difficult to date and is also so outrageous in what it claims for the Temple that it could hardly be taken to represent Herod's Temple, let alone Zerubbabel's; rather, it seems to be the product of grandiose imaginings. The 1st century C.E. Jewish historian Josephus and the early 3d-century rabbinic work, the Mishnah, both deal briefly with the pre-Herodian Second Temple. However, these sources are far more concerned with the last temple, that of Herod the Great. Finally, another ancient source dating from the late Hasmonean period, probably no later than the reign of John Hyrcanus (135/134–104 B.C.E.; so Yadin 1983: I, 39, 386–89), describes the Temple in great detail. This text, known as the Temple Scroll, clearly draws from biblical sources yet is visionary in nature. Consequently its reliability as a witness to the later phase of the Zerubbabel Temple is doubtful.

References to the Herodian Temple abound in the NT, in Josephus (mostly in *Ant* 15.12 and *JW* 5.5) and in the Mishnaic tractate *(Middot)* ("measurements"). A brief and not very useful description can be found in Philo. Of these four sources, Josephus and the Mishnah stand out for the wealth of technical, descriptive data that they contain. Josephus in particular represents an extraordinary testimony to the process of construction, in all its facets, that characterized the most famous of the manifold Herodian projects. The Mishnaic description tends to focus on the sanctuary itself rather than on the elaborate series of courts and porticoes that Herod's architects and engineers erected on the enlarged platform that constituted the Temple Mount.

As for the First Temple, with its several diverging sources, details of the Herodian Temple appear to be different in the two major written sources, Josephus and the Mishnah. Most scholars take seriously the fact that Josephus was a gifted historian and also an eyewitness observer of many of the events he chronicles and the places he describes. Inevitably there are contradictions, mistakes, and other problems in his description of the Herodian Temple. Yet he is a contemporary of that building, whereas the Mishnaic material was compiled long after the Temple was destroyed. The Mishnah may be akin to Ezekiel in its tendency to aggrandize and glorify the past; and for that reason alone the witness of Josephus, despite what is known of his penchant for exaggeration, may be preferable. Archaeological evidence (see below) from excavations on the Temple Mount (and from other places described by Josephus) is striking in its tendency to confirm the reliability of the Josephus accounts (Mazar 1975: 15).

In addition to *Middot,* other Tannaitic (Mishnaic) and also Amoraic (Talmudic) passages contain extensive materials dealing with the Temple in general. Most of these are concerned with the ritual acts that took place within the temple precincts and are not concerned with either the structure or its courts. The same can be said for references in other ancient rabbinic treatises.

2. Archaeological. The location of the Temple Mount in Jerusalem, and thus of the place where the three successive temples were built in biblical antiquity, has never been in doubt. The site is that of the Muslim shrine known as the Dome of the Rock (Qubbet es-Sakhra), built in 691 by the fifth Omayyad caliph, Abd-el-Malik, to mark the earthly spopt from which the prophet Muhammad was said to have

ascended to heaven. This spot is presumed to be very close to the site of the three ancient temples, if not above the actual place where the innermost sanctum ("holy of holies"; see below) of the temples once stood.

The beginning of the modern exploration and excavation of historic and holy sites in Palestine in the 19th century did not, therefore, involve attempts to locate the Temple's site. Research from the outset concentrated on the recording and identifying of the visible remains in the area of the Old City and the Temple Mount and on the excavation of areas not part of the Muslim holy places. Edward Robinson, the American biblical scholar who is perhaps considered the founder of biblical archaeology broadly conceived, first traveled to Palestine in 1838. Although he traveled widely in the land, he also spent considerable time exploring the Temple Mount, where he drew attention to a wide arch extending from the S end of the Western Wall (the remains of the great platform built by Herod to support the temple compound). That arch, which became known as Robinson's Arch, is one of the most impressive remains of the Herodian building project.

Other 19th-century explorers followed Robinson's lead. Perhaps most notable among them was Charles Wilson, whose publications in 1865 revealed the existence of another arch leading to the W side of the Temple Mount. Wilson, too, is commemorated for his discovery: the arch is called the Wilson Arch. Several years later, Charles Warren led a systematic exploration, which included soundings on three sides of the Temple Mount. Although he erred in some of his datings and conclusions, his skill as a trained engineer allowed him to produce drawings and diagrams of exceptional quality and of great value to all subsequent research. Among the many other late-19th-century scholars to work in Jerusalem, the German architect Conrad Shick deserves mention because of his topographical studies and also because of his famous reconstruction drawing of the Temple.

For most of the 20th century until the Six Day War of 1967, the ongoing archaeological attention to Jerusalem was directed largely to the many other vestiges of ancient Jerusalem of all periods and not to the Temple Mount itself. Beginning in 1968, an archaeological project of enormous proportions was initiated by Professor Benjamin Mazar on behalf of the Hebrew University and the Israel Exploration Society. The work of Mazar and his assistants (see Mazar 1975; Ben-Dov 1982) gave serious attention to the remains of all periods of occupation in the area excavated. Yet the main focus of this project, which concentrated on the S and W sides of the Temple Mount, was the recovery of architecture and artifacts that could be dated to the time of Herod and thus to the last of the Jerusalem temples.

The archaeological record for the Herodian period is thus extensive. The major features of Herod's ambitious construction projects have been identified, usually with the effect of corroborating the witness of Josephus. But even so, because the Temple Mount is a Muslim holy place, the site of the temple building itself has not been excavated. Furthermore, since Herod's workmen apparently demolished the Zerubbabel Temple, and since the 7th century Muslim architects cleared away the debris of the centuries before they began their work on the Dome of the Rock, it is unlikely that more than the most meager and scattered remains of any of the three ancient temples could ever be recovered. The verbal descriptions of 1 Kings and of Josephus remain far richer sources for our knowledge of at least two of the temples than excavation in Jerusalem could possibly provide.

Despite the limited results or potential of archaeological work related to the Jerusalem Temple in Jerusalem itself, the archaeological recovery of ancient Palestine and of the ancient biblical world has provided a rich array of evidence that indirectly informs the attempts of scholars to recreate the form and comprehend the meaning of the successive temples built in Jerusalem. Excavations of the major sites of the Canaanite and Israelite periods in Syria and Palestine have all sought to identify, describe, and classify the remains of temples found on these sites. The impetus to excavate temples and to establish a typology of temple architecture surely comes in part from the desire to shed light on the origins and nature of the Jerusalem Temple, which cannot be reached directly by archaeological investigation.

The excavations at such Palestinian sites as Megiddo, Ai, Arad, Shechem, Beth-shean, and Hazor have all contributed important data to an understanding of temple architecture in the Bronze and Iron Ages. Similarly, temple remains at several Syrian sites of the Neo-Hittite period, notably Tel Tainat, Alalakh,

and Zenjirli, exhibit features that can be compared to the First Temple. Analyses of Semitic temple architecture, particularly as it bears upon the Jerusalem Temple, have appeared sporadically in the past fifty years as independent works and as chapters in archaeological handbooks. Perhaps the first of these comparative studies is that of G. E. Wright, whose relatively brief treatment of Syro-Palestinian temples (1944) was in the context of a series of articles in *Biblical Archaeologist* on the "Significance of the Temple in the Ancient Near East."

Another, notable contribution to this comparative approach is that of Ottosson (1980), who discusses and catalogues the three basic temple types found in Syria-Palestine: the broad house (*Breitraum*), the longroom (*Langhaus*), and the square (*Quadratbau*). Aspects of at least the first two of these, if not of all three, appear to be relevant to the Jerusalem Temple. By far the most comprehensive study thus far is that of T. Busink (1970–80). Busink seems to examine the architecture as well as the contents of the Jerusalem Temple as completely as possible. In so doing, he reviews not only the comparative archaeological evidence and the literary sources but also the plethora of reconstructions proposed by scholars over the ages.

D. Solomonic (First) Temple

1. Davidic Precursors. The biblical sources and the weight of tradition all point clearly to Solomon as the Israelite monarch responsible for the original construction of the Jerusalem Temple. Nonetheless, as the biblical texts themselves make clear, the idea for this monumental building did not originate with Solomon. Furthermore, the architectural expertise, many of the building materials, and at least some of the skilled labor came from outside Israel's borders; the Phoenicians are clearly associated with the technical and material aspects of the temple-building project (see 1 Kgs 5:17–32). Still, King David is inextricably linked with the conceptualization of that project. But the fate of his vision for a divine dwelling place in Jerusalem took a curious turn, leaving his son Solomon as the biblical figure most prominently associated with the Temple.

When David captured the Jebusite stronghold of Zion, he built a royal palace there with the help of Phoenician workmen and materials (2 Sam 5:7–11). From his new capital, he set out to deal once and for all with the Philistines. Thereupon he brought the holy ark, the visible symbol of Yahweh's presence among the Israelites, up to Jerusalem and eventually, amidst a great celebration, deposited it in a tent that he had arrayed for it (2 Sam 6:17). As the beginning of Nathan's vision indicates, David fully intended to honor Yahweh with a permanent dwelling, for David already had a "house of cedar" while the ark of God was "sitting in the midst of curtains" (2 Sam 7:2). Thus he selected a site, the threshing floor of Araunah, as the site of the Temple. Furthermore, according to 2 Chr 22:1–5, David contacted the Phoenicians and procured all the materials that would be needed for the construction of the Temple. This part of the building process is attributed to Solomon in the Kings account.

The authenticity of the Chronicler's version has been questioned. In light of the known tendency of Chronicles to aggrandize both David and the cult, linking these two key areas of the Chronicler's interest might be construed as a feature of his manipulation of historical data. However, several recent trends in biblical scholarship now tend to validate the Chronicles account. David's ascension to the throne marks the transition of Israelite national existence from a tribal basis through a chieftaincy to a monarchy (see Frick 1985; Flanagan 1989). The political nature of David's kingdom in its imperial extent has been reemphasized (as by Malamat 1982). In that context, the construction of public works, which serve the state on a pragmatic level and also help to consolidate power and establish the new political authority, has been considered in relation to David's extraordinary political and military achievements (Meyers 1987).

The integrative role of monumental (temple) architecture in achieving stability and support in a centralizing state is apparently a fact of state formation that should be attributed to the beginnings of the Israelite monarchy, to the reign of David as well as to that of Solomon. David expanded the priestly bureaucracy according to the two lists of high officials attributed to the time of David (2 Sam 8:15–18 and 2 Sam 20:23–26; see also the Solomonic list, 1 Kgs 4:1–6). Furthermore, David's direct involvement in cultic matters as well as his association with psalmody (and thus liturgy) represent more than personal piety; David was astutely utilizing public cultural (religious) forms that served to garner wide support

among his constituency and to indicate the legitimizing presence of Israel's god Yahweh in the transition to statehood. Finally, David's conscriptive policies in securing both temporary and permanent labor forces was surely meant to foster public works. In light of these factors, the procurement of materials recorded in Chronicles seems a likely concomitant of these other features of David's relationship to the projected temple.

The Temple, once erected, conformed to an array of motifs (see below) that characterized sacred architecture in ancient W Asia. The steps leading to the construction and completion of a sacred building also constituted a distinct sequence of events in the Mesopotamian and NW Semitic world. A five-part thematic arrangement typifies such projects, and Solomon's temple-building efforts adhered to that arrangement (see below). But the David story includes the initial two stages of a temple-building project, and the intentions of David to erect a national sacred monument can be established not only by the biblical evidence but also by reference to such extrabiblical information about temple building. David's role as temple builder included the receipt of initial divine approval (2 Sam 7:3), site selection, and the amassing of materials and probably labor; it remained to Solomon to bring to completion David's strategic plan by overseeing the construction of the building and by carrying out a lavish dedication ceremony.

2. Architectural Features. The basic ground plan of the Temple was a rectangle, 100 cubits long and 50 cubits wide (about 165 feet × 841/2 feet). These dimensions do not include the platform upon which it was built (according to Ezek 41:13–14); but they do include the width of the interior and exterior walls as well as the auxiliary chambers and storerooms that surrounded the interior sacred space on three sides. (see Fig. TEM.01 and TEM.02)

The inner sacred space was subdivided laterally into three sections. This tripartite plan is similar to that of many of the Canaanite temples excavated in Palestine and also to the Neo-Hittite temples in N Syria. Of the former, the series of LB II temples at Hazor are often cited as having many of the features—proportion, size, or division of space—that characterize the Jerusalem Temple. As for the latter group, the small 9th-century temple adjacent to a royal palace, discovered in 1936 at Tell Tainat (McEwan 1937), has been singled out as the ancient structure that provides the closest parallel to the Jerusalem Temple. That this N example is closer than Palestinian ones is not surprising, considering the N (Phoenician) involvement in the Jerusalem building project and also in light of the fact that the Tainat example is closer in time (later by about a century) than the Canaanite ones, which predate the First Temple by at least several centuries.

Despite the similarities in plan and in decorative elements to roughly contemporary buildings of ancient W Asia, the Jerusalem Temple has no exact parallels. Some have suggested that, were a 10th-century Phoenician temple to be discovered and excavated, the existence of something approaching an exact parallel might be established. However, there is no reason to expect any sanctuary in the ancient world to replicate another. While current architectural modes were followed by the various structures of a given era, each building had its own idiosyncratic features and variations, in ground plan and decoration as well as in furnishings.

The interior tripartite division created three separate units, each 20 cubits in width. Taken together these units measured 70 cubits long, and 6 cubits separated the first two units and probably also the second from the third. The height of the central part is given as 30 cubits; the innermost part is 20 cubits high, with the difference in height not accounted for in the biblical sources; and the outer section may have also been 30 cubits high, or it may have been atop a platform ascended by stairs (so Ezek 40:49). The biblical information is inconclusive for all three dimensions; but a combined interior space for the three parts of about 1451/2 feet long and 35 feet wide, and 52 feet high in its central part, can be calculated using 20.9 inches as the size of the cubit, more specifically the royal cubit, which was probably the intended unit of linear measure in the biblical temple texts. The 20-cubit width, which seems to represent the largest distance that could be spanned without interior columnation, appears to be a realistic figure (Paul and Dever 1973: 78). The Temple was as large as it could be according to the architectural conventions of its day.

The first section of the interior space of the Temple is designated by the Hebrew word *ʾûlām,* which may be derived from a root *ʾwl,* "to be in front" (cf. Arabic *ʾawala,* "to be first"; so Gray *Kings* OTL, 163) and hence related to the Akkadian term *ellamu,* "front." The variety of the English renderings of *ʾûlām* is striking. The RSV translates it "vestibule" (as in 1 Kgs 7:19; 2 Chr 3:4). Other versions call it "porch," "entrance hall," or "portico." The LXX merely transliterates it. The resistance of the LXX to translate it and the diversity of English renderings reflect an uncertainty about the nature and function of this part of the Temple except that it was the first space that one entered.

Although the biblical information clearly intends that the *ʾûlām* be considered part of the internal space of the sanctuary, certain details of its construction set it apart from the other two internal sections. For one thing, it apparently was not flanked by the adjacent complex of auxiliary chambers of the Temple; it would thus have appeared to be a projection in front of the entire rest of the building. In addition, instructions are given for the paneling of the inner two sections of the interior but do not appear for the *ʾûlām;* this suggests that the walls of the first section may not have been treated so elaborately as those of the other two interior rooms. Further, the construction technique given for the *ʾûlām* (1 Kgs 7:12; cf. 1 Kgs 6:36) is identical to that described for the Temple's public court and also for the great courtyard that formed part of the adjacent palace area. Finally, the doorways to the two inner sections are presented in considerable detail, whereas no doorway at all is specified for the *ʾûlām,* a fact that is related to the omission of any height specifications for this first section.

These distinctions between the two inner chambers of the Temple and this first one suggest that it functioned as a transitional space that shared both in the closed sanctity of the interior and the more open accessibility of the courtyard space surrounding the Temple. It had no doorway and, without a height specified, perhaps no roof. As such it served as an open-air forecourt that gave access to the divine dwelling much as most Near Eastern houses or villas were reached through private courtyards.

This understanding of *ʾûlām* as forecourt is also suggested by the presence of the great pillars, named Jachin and Boaz (1 Kgs 7:15–22), on either side of the entrance to the *ʾûlām.* These somewhat enigmatic pillars were each 18 cubits high (according to 1 Kgs 7:15; 2 Chr 3:35 and Jeremiah in the LXX record the less likely figure of 35 cubits) and were surmounted by ornate double capitals at least another 5 cubits in height. Although the interior space of the Temple was lavishly decorated, the exterior stone walls presented a rather simple and unadorned visual impression. The elaborate bronze pillars, standing at the entrance, were thus the visual link, just as the *ʾûlām* was the spatial link, between the public areas outside the Temple and the private grandeur within. Although some earlier studies comparing the Temple to the Assyrian *bit hilani,* with its two entryway pillars supporting a lintel, suggested otherwise, the pillars were probably freestanding. As such, they can be considered the gateposts flanking the entrance to the forecourt of God's house and signifying the entry of the deity to this earthly dwelling (see Meyers 1983a, and below).

The second and largest section of interior space, measuring 40 cubits long by 20 cubits wide and 30 cubits high, is designated by the term *hêkāl,* or main room. The RSV calls it "nave," an inappropriate term derived from classical architecture in reference to the floor plan of a basilical building, in which the central space (nave) is separated from flanking spaces (aisles) by rows of columns or pillars. As noted above, the *hêkāl* may have originally been the only room of early Semitic shrines, since the term is sometimes used to designate the Temple as a whole (as Jer 7:4, Zech 8:9). Access to this central room from the forecourt (*ʾûlām*) was gained through a 10 cubit-wide doorway spanned by a double-hung door of cypress hinged on olivewood door-posts. The location of the windows of the Temple (2 Kgs 6:4) is not specified. If they indeed provided illumination in the central room they would have been set in the fashion of clerestory windows, high in its walls, above the height of the adjoining chambers.

The large size off this section of the Temple in relation to the other two parts suggests that it was the locus of much of the cultic activity connected with the interior space of the Temple. This supposition is supported by the fact that the internal furnishings of the Temple, which required regular ritual attention according to Pentateuchal sources, were located in the *hêkāl* (see below).

The innermost chamber is known as the *dĕbîr*, or "inner sanctuary" (RSV; other translations render it "oracle," "Holy of Holies," "shrine," "adytum," "most holy place"), a term that may be derived from the common Hebrew root *dbr* meaning "to speak." If this derivation has any validity, it would reflect the function of the inner chamber as the place where Yahweh's invisible presence or glory rested and from whence God "spoke," that is, gave oracles or responses to those who "inquired of the LORD." Entry to the *dĕbîr*, a perfect cube 20 cubits on a side, was gained through double-hung, olivewood doors.

The doors to bmth the central and inner chambers and the cedar walls of those two rooms were carved with some combination of cherubim, palm trees, and floral designs; they were then overlaid with gold. The floors of both these rooms were set with cypress boards, which, in one or both of these chambers, is said to have been covered with gold (2 Kgs 6:30). Thus, while the building was constructed of quarry-hewn stone blocks, no stonework would have been seen within these two spaces.

The auxiliary rooms surrounding the interior space are difficult to reconstruct. Apparently a multitude of small chambers of varying widths extended along the two sides and the rear of the Temple. They were arranged in three stories, each story having about thirty rooms. The rooms in the bottom level had an interior width of 5 cubits, and each succeeding level was one cubit wider than the one below, apparently because the thickness of the walls was decreased at the roof level of each of the upper two levels to allow for insertion of the roof beams (1 Kgs 6:6). Each level was 5 cubits high; their combined height was probably somewhat more than 15 cubits, if roofing thickness is added. Still, this auxiliary space reached little more than halfway up the 30 cubit high walls of the *hêkāl* (and *dĕbîr*). Access to all these rooms was apparently from the S side (1 Kgs 6:8), although Ezekiel reports entrances on both sides (Ezek 41:5–6). The orientation of the Temple is not specified, but this detail about the chambers indicates an E–W orientation (cf. also Ezek 8:16).

The outdoor space surrounding the Temple is given little attention in the Kings account except for the mention of an "inner court" (1 Kgs 6:36), which was constructed of "three rows of hewn stones and a row of cedar beams," just as was the great court of the nearby royal palace, and also the forecourt or "vestibule" (*ʾûlām*) of the Temple itself (1 Kgs 7:12). The paucity of information about the areas exterior to the building, along with the fact that the royal palace, with a very large courtyard space, was apparently adjacent to the temple precinct, suggests that the two precincts, temple and palace together, formed one very large royal-cultic compound. It is not clear how one moved between these two parts of the center of government of ancient Israel nor how access was gained to one or both from outside the compound. Presumably there were gates, as several passages in Ezekiel indicate. However, the references in Ezekiel to a complex series of gates, courtyards, and other structures may reflect the cumulative results of the renovations and rearrangements of space carried out at various times after the reign of Solomon.

3. Temple Furnishings. The elaborate temple structure with its interior decorations of costly, carved wooden panels and doors, overlaid with gold, did not sit empty. As a house for the divine resident, the interior was furnished, as was the courtyard in front of it. The interior furnishings were made of wood and covered with gold, while bronze is the material that dominated both the pillars (Jachin and Boaz) just outside the forecourt and the appurtenances situated in the courtyard.

The large central chamber (*hêkāl*) contained a number of different ritual furnishings. A small golden altar, probably made of cedar (1 Kgs 6:20) and used for incense, apparently stood in front of the entrance to the innermost chamber. No information about its size or location is found in the temple texts of 1 Kings; perhaps the information about the placement of the incense altar in the Tabernacle (Exod 30:6) is relevant. The lampstands, also made of gold (presumably laid over wood), were situated in two groups, five on the north and five on the south. These objects were probably hollow cylindrical stands surmounted by multispouted lamps (1 Kgs 7:49) and not the seven-branched stands so familiar from postbiblical art and as suggested by the Pentateuchal description (Exod 25:31–40; 37:17–24) of the single lampstand (menorah) that stood in the Tabernacle (*IDBS*, 586–87; Meyers 1979). A third kind of furnishing was the small table, also made of gold or perhaps just overlaid with gold, upon which the "bread of the Presence" was placed.

The cubical space of the inner sanctum (*dĕbîr*) was filled by two enormous cherubim, carbed of olivewood and covered with gold (1 Kgs 6:23–28). Each had a 10-cubit wing span, and each was 10 cubits high. The protective outspread wings of these composite beings sheltered the holiest object of all, the "Ark of the covenant of Yahweh" (1 Kgs 6:19), which was the specific representation of God's presence within the elaborate and richly decorated temple-dwelling. (On the question of whether the tabernacle was stored or erected therein, see TABERNACLE.)

A series of bronze appurtenances, of spectacular dimensions and design, were placed outside the Temple building. All were said to have been fashioned by Hiram of Tyre, who belonged to the tribe of Naphtali on his mother's side (1 Kgs 7:13–14). The two pillars just outside the entrance to the forecourt (*ʾûlām*) have already been mentioned.

An enormous basin, 5 cubits high and 10 cubits in diameter, was placed in the court at the SE corner of the temple building. The 1 Kings temple text calls it the "molten sea" (1 Kgs 7:23) or simply "the sea" (1 Kgs 7:24; cf. 2 Kgs 16:17). Elsewhere it is designated "bronze sea" (2 Kgs 25:13; 1 Chr 18:8; Jer 52:17). The basin rested upon four sets of three oxen, each set facing outward towards one of the four directions of the compass. The function of this imposing vessel is not specified, although 2 Chr 4:6 indicates that it was for priestly washing. Clearly its great size and elaborate ornamentation bespeak its symbolic value. Although the texts do not attempt to explain what that value might be, scholars have long assumed that the sea is related to the role of the "sea" or *apsû* in Canaanite and Babylonian mythology, with its vestiges in the Hebrew Bible (*ARI,* 148–50).

A series of ten objects, each 4 cubits by 4 cubits and 3 cubits high and each supporting a basin ("laver"), were also placed in the court, five to the south of the Temple and five to the north (1 Kgs 7:39). RSV "stands" does not properly convey the complexity of these objects, which rested on four wheels and which were decorated with an extensiive series of faunal (lions, oxen, cherubim) and floral (palm trees, wreaths) motifs (1 Kgs 7:27–37). Again, the use of these ornate and movable objects is not specified in 1 Kings, although 2 Chr 4:6 relates the lavers, which are said to have had a capacity of 40 baths (ca. 243 gallons), to the purification of certain sacrifices. The fact that Ezekiel omits mention of these wheeled stands accords with the fact that they no longer existed in his day.

In addition to these major cultic objects, the Kings account also lists a number of subsidiary bronze objects made by Hiram, presumably for the courtyard ritual (1 Kgs 7:40). Finally, the text mentions a detailed set of golden objects and fittings meant for the interior ritual (1 Kgs 7:48–50).

Amidst this elaborate array of cultic appurtenances described in 1 Kings, specifications for a courtyard altar are strangely absent. However, outside the temple texts themselves, the Deuteronomistic narratives assume that a bronze altar stood in the courtyard since the days of Solomon (1 Kgs 8:22, 64 and 9:25; cf. 2 Kgs 16:14). The parallel temple texts in 2 Chronicles include a large (20 cubits square and 10 cubits high) bronze altar (2 Chr 4:1); and Ezekiel of course describes an altar but probably one that came from later in the monarchic period (Ezek 43:13–17).

It is difficult to imagine, given the attention to symmetrical arrangements, that the "molten sea" at the SE corner of the Temple would not have had a counterpart, presumably the altar, at the NE corner. In the description of Solomon's dedicatory sacrifices (1 Kgs 8:64), the sanctification of space for sacrifice in the *middle* of the courtyard area is reported, an act that took place because the altar itself was too small for all the offerings of the occasion. Perhaps the middle space was available because the enormous appurtenances, sea and altar, were already in place on the N and S sides of the front of the Temple. In any case, it is unlikely that the omission of the altar from the temple texts of 1 Kings is the result of the absence of an altar, which was the most basic item of temple appurtenances in the ANE. The explanation for this omission perhaps lies in the role of Solomon's predecessor in the temple project. David had already built an altar at the place he had chosen for the Temple and had proceeded to offer sacrifices there (2 Sam 24:21, 25; cf. 1 Chr 21:18–22:1), thus initiating the altar and, in a sense, temple sacrifice long before Solomon's dedicatory feast.

4. Role in National Life. Solomon's workers, according to 1 Kgs 6:37–38, completed their monumental task in seven years, between the fourth and eleventh years of his reign. This is a relatively short

construction time, considering the grandiose nature of the building and its furnishings. Some scholars thus feel that the details of fabrication are exaggerated, that the extent of costly (gold and bronze) decorative elements and cultic objects are beyond reasonable possibilities, and that the sheer size of certain aspects of the building and its associated features is improbable. Such objections to the biblical description are difficult to evaluate. However, archaeological discoveries of architectural modes and artistic motifs in ancient W Asia tend to authenticate the biblical record of the Temple in its conception if not in its scope. Whether or not the text preserves an accurate picture of the Temple, the idea of an extraordinary and precious sacred structure located on Mt. Zion in Jerusalem is emphatically presented in the Kings account. Later biblical materials only serve to intensify the sense of the building's magnitude and grandeur.

Because of its prominence in the text, and because of the way its basic form and decoration can be linked to Iron Age styles, the Temple of Solomon clearly played a central role in the emergent national state. As a house for God, its role can of course be evaluated in terms of the religion of ancient Israel. However, to do so without also giving attention to its part in the economic and political dynamics of the Davidic-Solomonic empire would be both to underestimate its religious value and to lose sight of the integral nature of the religious and sociopolitical spheres in the ancient world.

a. Religious Symbolism. The ability of the Temple to play an important role in the national and international life of the imperial kingdom of Solomon lay in its conceptualization as a divine dwelling place on earth. Although the God of Israel was viewed as transcendent, and God's presence was hardly restricted to a designated place or places, the need for the assurance of divine availability led the Israelites, like all other peoples, to establish locales in which access to the transcendent deity could be secured. The nearly universal human willingness to commit substantial resources to the construction of sacred buildings, the maintenance of expensive cultic practices, and the provision for extensive priestly personnel attests to the profound nature of humanity's insecurity about the nearness of divine power and protection (Levine 1968).

The presence of God in Jerusalem was all the more critical at the period of sociopolitical transition (see below) at the outset of the monarchy. The great risks involved in the military and diplomatic endeavors of the earliest biblical monarchs motivated them to establish new visual cultic forms, or emphasize existing ones, so that the availability of divine support for these ventures could be assured. The ability of the Temple to convince both the rulers and the ruled of its efficacy in representing God's presence rested upon its incorporation of features that were part of the symbolic language of sacred art and architecture in the world of the Israelites.

The symbolic nature of the Jerusalem Temple, as for all major shrines in the ancient world, depended upon a series of features that, taken together, established the sacred precinct as being located at the cosmic center of the universe, at the place where heaven and earth converge and thus from where God's control over the universe is effected. When the royal capital is brought into this sphere of divine activity through the construction of a temple, the regime acquires the might involved in the heavenly arena. A series of visual symbols, rooted in the mythic consciousness of the Israelites and their neighbors, provided the affective power of this notion of cosmic center. Evidence for the Israelite understanding of the symbols of the sacred center comes not only from the details of temple construction but also from the poetic celebration of Zion in psalmody and prophecy.

Perhaps chief among the symbols expressing the sacred centrality of the Temple is the idea that Zion, and the Temple built there, is the cosmic mountain (Clifford 1972; 1984; Levenson 1985: 111–75). The temple building, on a mountain and a platform, replicates the heavenly mountain of Yahweh (cf. Ps 48:1–4) and also its earlier manifestation at Sinai. It also reaches back to the beginning of time, to the creation of the world (cf. the seven years of Solomonic temple-building activity in relation to the seven days of creation). The foundation of the Temple thus becomes a protological event, going back to the beginnings of time and established by God, not by either David or Solomon (see Ps 78:69–70).

Other symbols constitutive of the cosmic order made visual and vital in the Temple can be identified in the exuberant presence of floral and faunal motifs in the interior decoration of the building and in the construction and decoration of its appurtenances. The trees carved on the walls, the groves on the Temple

Mount, and perhaps even the sacred lampstands, are part of the symbolic expression of the mythic Tree of Life that stood on the Cosmic Mountain, and in the paradisial garden at creation. Similarly, the waters of the Molten Sea and the great fountains of the deep present in God's habitation on Zion (Ps 46:4) contribute to the notion of the Temple as cosmic center.

The convergence of heavenly temple and earthly temple, with the concomitant reality of God's presence, is further conveyed by the overriding concern to make the Temple a fit dwelling place for the divine sovereign. The degree to which the quality and scope of the temple complex and its objects manifest the finest and costliest materials affects the way in which the most exalted of inhabitants is understood to be nearby in this house. The very terminology used for the building ("house," "palace") and the emphasis on the extraordinary nature of its design and fabrication together provide symbolic statements that God is in residence on Zion. The furnishings meet the "needs" of the building's occupant, with the glory of those furnishings signifying the Glory within.

The notion of purity associated with the Temple likewise intensifies the sense of divine nearness. The Temple precinct, its contents, and its personnel exhibit a gradation of materials used and of cultic acts performed which can be reconstructed in part from the Kings account and in part from the evidence of the tabernacle materials (Haran 1978: 175–88, 205–29). Every category of structure, furniture, ritual, and human attendants is arrayed in a continuum, from the profane territory outside the sacred precinct, to the somewhat holy and pure character of the courtyard area with its bronze implements and its access to the public, to the holier and hence more pure and precious gold-adorned *hêkāl,* to which only certain priests had access, and finally to the inner sanctum, the place where God's glory rests. The innermost room was the essence of holiness and thus off-limits to all but the chief priest, only once a year and only after he attained an exceptional state of purity (at least in Second Temple times).

This carefully arranged gradation involves a consciousness that the closer one gets to the inner sanctum, the nearer one is to the perfection of the divine presence. Even if an ordinary individual can never approach the holiest place, the existence of the concentric circles, as it were, of increasing holiness signified that the Holiest One of all could be found at the sacred center.

The purity of the sacred center involved physical cleanliness. But it also involved the moral perfection associated with the nature of Yahweh. The Psalmist who expressed the need for both "clean hands" and a "pure heart" in order to ascend the Temple Mount (Ps 24:3–4) points to the nature of the cosmic center as moral center (Levenson 1985: 172). God's presence in the inner sanctum, in the last analysis, is symbolized by the covenant document, the "two tables of stone" contained in the ark that was placed under the protective wings of the cherubim and that represented the moral imperatives of the Israelite pact with Yahweh, according to the Deuteronomistic record of the Temple dedication (1 Kgs 8:9). As important as the ideas of cosmic center and divine accessibility are for understanding the role of the Temple, so too is the association of sanctuary with covenant and the concomitant establishment of social order through law (Lundquist 1988; and see below).

b. Political Function. David's intention to construct a major sacred edifice in Jerusalem and Solomon's compliance with his father's plan virtually from the outset of his long reign represent neither acts of personal piety nor arbitrary quests for personal aggrandizement nor the considerate provision of divine availability to any Israelite whose heart and hands would turn towards the Temple Mount. The Jerusalem Temple, in dimensions alone if not also in decoration, was apparently one of the largest and most beautiful structures of its kind in ancient W Asia. It is not a coincidence that the construction of this sacred complex is associated with the formation of a national state that, for less than a century, occupied a unique position in the ongoing power struggle that for millennia has characterized the narrow strip of land between the Jordan River and the Mediterranean Sea. The construction of the Temple has typically been seen as a by-product, and a somewhat overblown one at that, of Davidic and Solomonic political might. It now may be more accurate to understand the Jerusalem Temple as an essential part of state formation rather than as an ornament of such a process.

The Davidic-Solomonic state not only unified the tribal groups inhabiting the highlands from Upper Galilee to the N Negeb; it also extended its domain to the surrounding regions of Syria and Transjordan.

Jerusalem became the capital of a nation-state squeezed between the Jordan Rift and the Mediterranean. That in itself was a status not easily won in the Levant. But Jerusalem became more than the capital of a small kingdom; for one fleeting moment in the long history of the Near East, Jerusalem was the seat of an empire, albeit an empire of modest proportions in comparison with the territories periodically controlled by the ancient superpowers of Egypt, Syria, and Mesopotamia.

That David set out to acquire such extensive territory when he began his military forays is impossible to determine. Yet the momentum of his military strategy and his charismatic leadership brought victory on the battlefield and carried him further and further afield. This success can hardly be comprehended unless it was the result of careful and astute advance planning. David succeeded by the end of his reign in establishing a supranational state—a centralized polity with a ruling bureaucracy that exercised a monopoly of force over a three-tiered constituency of immediate supporters, the Israelite tribal groups, and imperial subjects.

David's ability to establish an imperial domain and Solomon's success in sustaining it are both linked to the way in which their policies and sovereign acts succeeded in convincing their subjects that obedience to royal dominion would be amply rewarded by peace, stability, and prosperity. The initial force of arms to achieve subject compliance had to be replaced or accompanied by effective assurance that the monarchic authority also had *the right* to exercise power. Throughout ANE history, divine sanction has been invoked to legitimize that right. Communication of the deity's approval of the ruling power and involving the populace in the goals of the state were characteristically effected by the construction of a monumental religious building or, if a new dynastic power was emerging or a major political shift was taking place, by the renewal or renovation of an existing structure.

Recent research has identified the various features of a typology of temple building that obtained throughout the ANE and has shown that the Jerusalem Temple partook of the dynamics of that typology. For example, the series of steps leading to the completion of a legitimate temple, which the deity will approve and agree to inhabit, can be identified in the biblical texts relating to the Jerusalem Temple. David initiated these steps; Solomon repeated some of them and completed the ones David had been unable to carry out. In so doing he assured the legitimacy of the shrine.

The legitimacy of the shrine as a House of Yahweh in turn gave legitimacy to the monarchy. It helped to convince those whose resources and labor contributed materials and manpower to the temple project that their service was divinely ordained. But their contributions were not simply in the service of a coercive bureaucracy. The temple typology that heralded the presence and sanction of the deity in the cosmic center symbolized and secured by the Temple included the establishment of just rule through law, and hence social stability. The culminating feature of this typology was the belief that the construction of a major temple would ultimately bring peace and prosperity to all the inhabitants of the realm.

Many of the aspects of the religious symbolism of the Jerusalem Temple discussed above constitute elements in this typology of temple-building. Holy mountain, cosmic center, living waters, sacred vegetation—all of these features are visual indications of divine presence and of God's participation in the fortunes of the nation-state ruled from the temple-palace complex. The sacred precincts on the Temple Mount constituted a visual revelation, a signification of Yahweh's potent availability. The overwhelming dominance of verbal revelation in scripture and in postbiblical Judaism and Christianity makes it difficult to appreciate the visual component of biblical religious experience (Levenson 1985: 145–51). Yet the temple materials in the Bible record a visual reality that conveyed on an affective, nonverbal level the accessibility and the revelatory might of the unseen God of Israel.

Such interrelated religious and political significance was operant for all three components of the Davidic-Solomonic realm. The subject peoples were perhaps the most difficult of all to convince of Yahweh's (and thus the Davidides') supremacy. For them, the Jerusalem Temple's striking reality communicated the message of Yahweh's presence and power in the language of visual symbolism and through the modes of design and decoration that were part of their own cultural vocabularies. Much has been made of the Davidic and Solomonic "borrowing" of Phoenician workers and artistry, as if Israel lacked indigenous artisans and creativity. That may be so; but there is a certain political genius involved

in appropriating architectural conventions to form a visual idiom that would have been meaningful to the widest possible population.

The erection of Jachin and Boaz (see above) is a case in point. The two gateposts flanked the forecourt to the Temple, just as the monumental gateways of many major Near Eastern cities marked the entrance to the sacred precincts. As the stone-carved reliefs adorning some of these gateways show, the completion of a temple was marked by a grand procession and celebration by which the statue of the god of the new temple was taken through the city, into the sacred compound, and finally into the niche for the cult statue in the inner sanctum (as at Khorsabad, Carchemish, Karatepe; see Barnett 1981). The two pillars in the Jerusalem Temple, along with the 1 Kings 8 description of the bringing of the ark into the Temple and the accompanying extravagant dedicatory feast, belongs to this scheme of introduction: bringing the deity into the new abode. Once installed within, the pillars as gateposts remain highly visible, signalling the legitimizing presence of Yahweh in the Temple to all subsequent onlookers. For Solomon, those onlookers included the array of emissaries and wives from subject peoples or from other foreign peoples in uneasy alliance with the ascendant Israelite ruler.

These religious-political dynamics clearly functioned on an economic level as well. The Temple, with its treasures and treasuries, was a national bank of sorts. It was a stronghold, safely situated in the most defensible part of the Jerusalem landscape. The extracted tribute of the peoples conquered by David, perhaps referred to in the terse comment in 1 Kgs 7:51 that Solomon brought into the temple treasures all the precious materials that David had dedicated to Yahweh, became part of the national assets. Presumably, some of the tribute collected by Solomon also made its way into the temple precincts. The some ninety side chambers of the Temple provided storage for more than the cultic objects used in the rituals of the *hêkāl* and the court. They also held at least some of the revenues of the state, be they the tribute of foreigners or the sacrificial surplus brought by Israelites. The sacred space of the temple building itself, off-limits to all but a small group of priests, offered maximum security for the resources of the realm.

As a state institution, the Temple thus represented the intersection of the ideological values and religious beliefs of the nation with the social, political, and economic aspects of its organization. As a monumental public work markilg the transition from tribal league to nation-state, it was instrumental in establishing both divine and royal power. The fact that Temple and palace occupied adjacent areas in Jerusalem does not mean, as some have supposed, that the Temple was merely a royal chapel for Solomon and his court. Rather, its smaller size bespoke the fact that it was not meant as a physical place for multitudes. But it was a place that multitudes could see in its conspicuous location near the palace. With its visual symbols of holiness that could be comprehended by all, both Israelites and foreigners were apprised of Yahweh's revelatory and legitimizing sovereignty.

E. First Temple After Solomon

In light of its integral and integrating role in the dynamics of Israelite national life, it comes as no surprise that the ongoing history of the Temple is related to both internal and external aspects of the history of the southern kingdom, Judah, which retained Jerusalem as its capital and the Temple as its sacred center following the dissolution of the united monarchy and the loss of subject territories after Solomon's death. Incursions by foreign powers often meant the diminution of the Temple's resources and thus of the state's vitality. Only five years after Solomon's death, his son Rehoboam was forced to relinquish quantities of treasure to the invading Shishak of Egypt (1 Kgs 14:25–26) while at the same time becoming embroiled in armed struggle with the sister kingdom Israel to the north.

Early in the 9th century, Asa removed all the silver and gold "that were left" (1 Kgs 15:18) in the Temple stores, a statement implying that these resources had already been depleted. Asa presented these treasures to the Syrian ruler Ben-Hadad in order to secure a Syrian liaison against the northern kingdom. Later in the 9th century, Joash drew upon temple revenues to institute extensive structural repairs to the divine dwelling (2 Kgs 12:1–16), a restoration project effected with some difficulty. No explanation for priestly resistance to Joash's orders is offered in the Kings account. Yet the looming Syrian threat may have meant that the nationalistic statement made by the temple work seemed unwise to some factions.

Indeed, Joash eventually emptied the temple treasuries of its resources, consisting mainly of the votive offerings of his three predecessors, in order to appease Hazael of Syria. Nearly a century later, Hezekiah presented Sennacherib with a tribute consisting of all the silver from Yahweh's house (and from the royal palace too); he also stripped off the gold trim of the temple doors and doorposts (2 Kgs 18:14–16). The latter were adornments that Hezekiah himself had commissioned for the Temple and perhaps are indicative of other refurbishings likely to have accompanied his purge of the Temple of the alien elements introduced by his predecessors.

Additions or changes to the Temple and its furnishings often reflected the political entanglements of the Judean rulers. Normally viewed through the tendentious perspective of the Deuteronomistic historian as syncretistic acts disloyal to Yahweh, the bringing of foreign cultic elements into the Temple can also be seen as strategic religio-political accommodations to foreign powers. Ahaz, for example, may have been currying favor with Tiglath-pileser III of Assyria and with the powerful Assyrian gods by installing a new altar fashioned exactly after one that he saw on a state visit to the Assyrian monarch in Damascus (2 Kgs 16:10–16; cf. Ezekiel's description, 43:13–17). Ahaz also altered other items of the courtyard appurtenances, and he removed some post-Solomonic architectural additions apparently in compliance with Assyrian standards (2 Kgs 16:18).

Similarly, Manasseh installed various non-Yahwistic cultic elements into the Temple and its courts (2 Kgs 21:3–5), actions that may have troubled Judean loyalists but that were also strategic ploys in the face of Assyrian hegemony. Josiah later could reverse Manasseh's deeds, in his radical centralizing purge; but he could do so because of the effective demise of Assyrian might by the late 8th century. Josiah's extensive temple restoration project (2 Kgs 23:3–7; 2 Chr 34:8–13) was a nationalistic move. He strengthened his Jerusalem power base by ridding the sacred center of foreign elements and thus establishing the renewed legitimacy of his rule under Yahweh alone.

In the many centuries between Solomon's implementation of the bold and visionary temple project of King David and its destruction at the hand of the Babylonians, the Temple underwent countless changes, some directly recorded in the Bible, some tangentially indicated, and others no doubt left unmentioned. All of these alterations were related to some extent to the waxing and waning of monarchic power. It is no accident that the biblical report of the Babylonian conquest of Jerusalem records the burning of the Temple as the first in the litany of conquering deeds perpetrated upon the Judeans and their institutions (2 Kgs 25:8–9; Jer 52:12–13). The royal palace, which had probably also seen countless renovations over the centuries since Solomon built the "House of the Forest of Lebanon" (1 Kgs 7:2) and which probably was as likely a source of booty as the Temple, was also burned, along with other palatial dwellings. Yet only the sacking of the Temple is recorded.

The Deuteronomic historian, in describing the loss of the Temple furnishings, is reporting the demise of the political state more than would a description of the sacking of the palace or its furnishings. The removal of the pillars of bronze receives special attention (2 Kgs 23:13, 16–17) in the sad tale of the devastation of Jerusalem. Just as the erection of the two pillars marked the legitimizing entry of Yahweh into the earthly dwelling, the toppling of those highly symbolic elements of the Temple signified the loss of political autonomy in the eyes of the Babylonian forces, the surviving Judean bureaucracy, and the remnant of the people.

F. Temple of Zerubbabel

The First Temple was subject to continual alterations, which paralleled political shifts, during its four centuries of existence. So too the successor structure in Jerusalem cannot be conceived of a single building, standing unaltered from the late 6th century until the next catastrophic destruction at the hands of the Romans in 70 C.E. The shifting fortunes of the postexilic community are mirrored in the complex architectural history of the Second Temple. As for the First Temple, not all of the inevitable modifications are preserved in the ancient sources. Yet some of those changes, especially in the late centuries B.C.E. after the rise of Hellenism in the Near East, can be detected.

The most radical change of all, associated with the grandiose building schemes of Herod the Great in the last decades of the 1st century B.C.E., resulted in a temple building that was not technically a

renovation: it was an entirely new structure. Consequently, the Herodian Temple constituted in fact a "Third Temple," although it is often subsumed under the designation "Second Temple" since there was no chronological interruption of consequence involved when Herod built a spectacular new edifice to replace the Temple dating back to Zerubbabel.

1. Postexilic Rebuilding. The ruins of the First Temple remained desolate on the Temple Mount for the long decades of Babylonian rule over Judah. However, the conquest of the Babylonians by Cyrus the Great in 538 B.C.E. had momentous consequences for the inhabitants of Judea, now called (or soon to be called) the province of Yehud, as well as for those living in exile. Persian imperial policy under Cyrus involved granting more autonomy to subject peoples than had either the Babylonians or Assyrians before him. As for other displaced groups, Cyrus encouraged the Judean exiles to return to their homeland. An official edict, recorded on a clay cylinder and echoed in two biblical versions (in Hebrew in Ezra 1:1–4; in Aramaic in Ezra 6:1–5), permitted not only the return of the exiles but also the rebuilding of the Temple. The latter aspect of Persian policy was tantamount to restoring a measure of political autonomy to the Judeans, albeit without the restoration of a royal house, even though the man eventually appointed governor, Zerubbabel, was a Davidic scion.

The temple rebuilding project began with a restoration of the altar, the amassing of materials and workers, and a celebration marking the renewal of the foundations of the Temple (Ezra 3). Cyrus had already allowed the surviving temple treasures brought away by Nebuchadnezzar to be returned to Jerusalem (Ezra 1:5–11). Yet the project was stalled, apparently for local political reasons. It remained for Darius I to reinstitute Cyrus' encouragement of the Jerusalem Temple restoration. With the support of the prophets Haggai and Zechariah, the restoration work was begun again in the fall of 520 B.C.E. The Temple was soon completed and was rededicated by 516 or 515, just about exactly at the end of the seventy years of desolation that prophetic tradition foresaw as the fate of the sinful Judeans and their Temple (Jer 25:11–12; 29:10; cf. Meyers and Meyers, *Haggai, Zechariah 1–8* AB, 117–18).

The biblical information about the Temple restored under the leadership of Zerubbabel and the high priest Joshua (Hag 1:1, 12; 2:1) comes mainly from the contemporary witness of the two prophets who encouraged the project and also from the somewhat later record in Ezra. None of these sources provide much by way of concrete data about the dimensions and quality of the renewed edifice; it is perhaps ironic that the temple building that survived the longest—almost exactly five centuries—evoked the least descriptive material in the literary record. Presumably, the surviving foundations and rubble of walls, along with the availability of the Deuteronomic temple descriptions as well as the Pentateuchal tabernacle texts, guided the supervisors of the construction work. The outstanding richness of the Solomonic structure may not have been replicated. Yet it is reasonable to believe that the ground plan of the Zerubbabel building followed that of its predecessors; and the availability of precious temple items carried to Babylon in 587 allowed for a return to at least some semblance of the First Temple's splendor.

The physical attributes of the Zerubbabel Temple are elusive; but the symbolic qualities survive in a prominent way in postexilic prophecy, especially in the unique set of visions found in First Zechariah. The visionary materials found in Zech 1:7–6:15 contain many of the symbolic features associated with the First Temple. Often called the "temple visions," their very sequence and structure envision a universe with the Jerusalem Temple at its sacred center (see Meyers and Meyers *Haggai, Zechariah 1–8* AB, liv–lix, and chart 8). Further, the revelatory nature of the visions constitutes the equivalence, in a community without a royal leader, of the preconstruction revelation to the king that characterized Near Eastern temple-building typology and that was present for both David and Solomon.

Other features of the envisioned Temple in Zechariah contribute additional evidence of its symbolic holiness and centrality. The association of the Temple with law and justice (covenant and order) is present in the charge to the chief priestly official (Zech 3:7) who will have access to heavenly justice at the Temple as sacred intersection of earth and heaven. The necessary purity of the high priest involves cleanliness and also the removal of all iniquity (Zech 3:3). The concern for righteousness and justice is also part of the symbolic message of the flying scroll in the fifth vision (Zech 5:1–4). The enigmatic stones of Zech 3:9 (cf. 4:7 and 4:10) participate in the language of temple foundation (see *Haggai,*

Zechariah AB, 204–7, 246–48, 253–54), particularly in the paradigms of temple refoundation, in which a new ruler and polity create anew, on an existing temple site, a sanctuary that has existed since the beginnings of time. The golden lampstand of the central vision (Zech 4:1–6a, 10b– 14) merges the prophet's knowledge of First Temple and of Tabernacle appurtenances. It introduces the richness and purity of an extravagantly golden object, and it invokes the notion of sacred tree in its portrayal of two olive trees flanking the lampstand.

The oracular materials in Zechariah, which frame the visions and are also integrated into them, also contain vivid imagery of the cosmic center. Prominent among such passages are those heralding the "great mountain" (Zech 4:7), the "Mountain of Yahweh" (Zech 8:3), and the "Mountain of Holiness" (Zech 8:3). These designations echo the literary and visual idioms of temple building found throughout the ANE as well as the many biblical references, notably in Psalms, linking temple and mountain and thus portraying the Temple as the embodiment of the cosmic mountain.

Finally, the notion of prosperity and fecundity that result from the construction of a divinely ordained and approved temple, in which the deity's presence is thus secured, is an integral part of the message of both Zechariah and Haggai. Haggai contrasts the relative impoverishment of the inhabitants of Yehud (Hag 1:6, 10–11) with the bounty that will obtain once the temple project is underway (Hag 2:10–19). Zechariah, too, equates anticipated prosperity (as in Zech 2:8–9 and especially 8:9–13) with the restored divine presence in the Temple (and thus throughout the land) and the attendant blessings. As for Solomon centuries before, and as for countless monarchs of the ANE, the legitimation of a political entity signified by the deity's dwelling and presence meant social stability and economic growth.

The clear presence of typological and symbolic elements of temple building for the postexilic period is all the more significant because these elements retained their value for the inhabitants of Yehud in the face of the absence of a crucial element. The construction of a monumental sacred structure, expressed in the cosmic vocabulary of both texts and artistry, was characteristically and fundamentally associated with state formation or state renewal. For the restoration community, such full political autonomy was precluded. Yet the Persian overlord saw the value in granting near autonomy to this and other subject peoples by encouraging the building of local temples. This policy was intended to secure loyalty and also stability, since the renewal of legal authority was a commitment feature of the revival of a sacred structure.

Whatever the strategic aims of Darius' policy may have been, the effect for the restoration community was the transition of a Yahweh-centered people organized in an autonomous nation-state to that of a Yahweh-centered community lacking full political autonomy. The Zerubbabel Temple stood alone, with no adjacent royal compound. It thus gave legitimacy to a new form of community identity that was not linked, except in eschatological vision, to monarchic rule. The construction of the Second Temple in Jerusalem validated a community consisting of people present in Yehud and also those still in exile; and it secured the authority of the community ideals contained in the legal code or Torah promulgated as law under Persian encouragement.

2. Post-Zerubbabel Alterations. Virtually no information about the fortunes of Zerubbabel's Temple in the centuries immediately after its dedication is available. Occasional passages in Nehemiah refer to ritual acts associated with the Temple (Neh 10:32–39; cf. 12:44–47). Some elaborations of the Second Temple may have accompanied the revitalization of Jerusalem and its fortifications in the mid-5th century. No record of such activity exists except for the cryptic notation that before setting out on his mission, Nehemiah secured permission to procure lumber for his projected work in building the walls of Jerusalem, his own house, and also the "gates of the fortress of the house" (Neh 2:8). If the "house" is the Temple, then some changes were surely made in the time of Nehemiah.

The use of "fortress," apparently in relationship to the Temple, is one of several references in Nehemiah to features of the Temple precinct that are unknown from earlier sources. Another cites a chamber prepared for Eliashub the priest in the "courts of the house of God" (Neh 13:7); this chamber seems to be distinct from the storage chambers attached to the temple building itself (as probably in Neh 12:44; 13:4–

5). These features may have been present since the days of Zerubbabel, or they could equally represent alterations carried out thereafter.

Similarly, the broad area (Neh 8:1) in front of the Water Gate where Ezra read the law to the gathered assembly may have been an outer court of the Temple. The reading of the Torah of Yahweh would presumably have taken place close to God's residence (so 1 Esdr 9:3). However, the gate and court system of the refortified city and of the temple compound within cannot readily be understood. Although only the inner court is mentioned for the First Temple at its inception, sources for the late Second Temple refer to a variety of inner and outer courtyard areas, a picture in accord with Nehemiah's allusions to structures for priestly use situated at some distance from the Temple.

Following the Greek conquest of Palestine, a succession of rival factions seeking to control Jerusalem left their mark on the appearance of the Temple. As the Seleucids began to dominate the Ptolemies, who had held sway in Jerusalem at the outset of the Hellenistic age, the high priest Onias II, who backed the Seleucids, gained power. Early in the 2d century, Onias' son Simon apparently made extensive repairs to the Temple under Seleucid sponsorship (so Sir 50:1–21). The report in Ecclesiasticus invokes cosmic language (fountains of water, holy trees) and also makes it clear that the renovations were really in the nature of fortifications.

The security of the Temple Mount and of the Jewish community under the Oniads was in jeopardy, and internal strife among Jewish factions made the Temple vulnerable to the advancing Seleucid forces. The consequent seizure of Jerusalem in 168 B.C.E. by Antiochus IV is recorded in several ancient sources (1 Maccabees; Daniel; Josephus), all of which deplore the desecration of the Temple perpetrated by the Seleucids. Antiochus IV intended to eradicate Jewish culture and replace it with Hellenistic culture; and he took steps to do so by placing in the Temple, at the focus of Jewish life, a statue of Zeus Olympius. This outrageous religio-political act triggered a successful revolt, the Maccabean War; and the purification of the Temple marked the restoration of Jewish autonomy in Judea. The relatively brief span of the Hasmonean rule in Jerusalem was marked by internal strife, the vagaries of which apparently saw repeated although minor adjustments to the Temple. The nature of these adjustments was that of increasing the fortifications of the Temple, a sign of the tenuous grasp of independence by the Maccabean rulers and of the increasing threat posed by the expanding interests of Rome into the troubled Hasmonean state.

By 63 B.C.E., Roman domination of Jerusalem was established, marked by Pompey's three-month siege and then capture of the Temple Mount (Josephus *Ant* 14.3.1–4.4; also *JW* 1.7.6) and later by Crassus' plunder of the temple treasures. However, it was some years before the Maccabeans were fully ousted. Although vassals of Rome, they tried to resist Rome by regaining the safety of the temple fortifications (*Ant* 14; 13.3–4; 16.2). Nonetheless, authority over Judea was held by a Roman appointee, Antipater the Idumean. Even after Antipater's appointment, Hasmonean resistance continued and was not finally overcome until Antipater's son Herod laid siege to Jerusalem and captured the Temple Mount in 37 B.C.E. Herod had plans for Judea that involved a radical transformation of the kingdom from a provincial Jewish community to a model of Hellenistic culture.

G. Herodian Temple

Herod had an exalted view of his constituency. His building schemes, especially for the Temple, were geared towards three distinct groups whose support, respect, and admiration he sought. He saw himself as king of the Jews—not only the local traditional Palestinian Jews, but also the patrician Jews living both in Judea and in the Hellenistic Diaspora. He hoped to serve the concerns of the former group by upholding traditional Jewish religious practices and especially, in terms of his building projects, by restoring the Temple, which had suffered the ravages of the previous centuries of strife. In setting out to have a new building constructed, he was careful to adhere to authoritative specifications in the canonical texts. Thus he was limited in the size of the building he could construct.

Yet the standards of the Hellenistic Jews, living in cosmopolitan cities of the classical world such as Corinth, Alexandria, Antioch, and Rome, and accustomed to seeing sacred architecture on a more massive scale than that recorded for the First Temple, also had to be met. The same might be said for the third

group in Herod's purview: the Roman authorities upon whose favor his right to rule in Palestine depended. By making Jerusalem a spectacular metropolis carrying out its international business in the shadow of a shrine that legitimized the full political and economic range of the city's activities, Herod would retain the favor of Rome. The scope of a much-enlarged Jerusalem and the classical tastes of the imperial power to the West both mandated a temple larger than those of comparable eastern cities. Just as David and Solomon planned, in accord with the international status of Jerusalem, a temple grander in size and decoration than those of the nations with which the Israelite empire was interacting, so too would Herod have to commission a building that would be preeminent in its day.

The inherent tension between the size limitations of the canonical blueprint and the more massive standards of Hellenistic-Roman architecture was resolved by Herod and his architects with a bold plan. While the Temple itself would have to have the same dimensions as its predecessors, the Temple Mount was not restricted in its potential size. Herod would expand and raise the temple platform, thus creating an unparalleled and truly monumental temple precinct containing the sanctuary, courts, gates, a fortress (Antonia), approaches, porticoes, and subsidiary buildings. So incredible were the dimensions of this project, as recorded in Josephus and, with some variations, in Mishnah *Middot*, that many scholars suspected Josephus of gross exaggerations.

The archaeological work in Jerusalem since 1968 (see above), while not able to excavate the site of the sanctuary, has undertaken extensive and careful excavations of the Temple Mount's massive support walls and of the arched ramps leading up to the surmounting enclosure walls and gates. The magnitude suggested by the ancient sources has been strikingly confirmed. The enormous raised platform was indeed constructed in the Herodian period, and the resulting size of the Temple Mount compensated for the relative modesty of the Temple's size. The Temple Mount as a whole could be viewed as a suitably imposing feature dominating the Jerusalem landscape.

This extensive platform, with its huge retaining walls to bear the weight of the fill and of the structures to be built above, was trapezoidal in shape. The area of this expanse was over 172,000 square yards, making it the largest site of its kind in the ancient world (Ben-Dov 1982: 77). See Fig. TEM.03. The entire holy area was twice as large as the monumental Forum Romanum built by Trajan, and three and a half times more extensive than the combined temples of Jupiter and Astarte-Venus at Baalbek.

The retaining walls themselves towered more than 80 feet above the roadways going around its perimeter and reached over 50 feet below street level in their foundation courses. The stones used to build these walls were gigantic. On the Western Wall (the "Wailing Wall" in Jewish tradition) the largest stone is about 40 feet long; an even larger one in the S wall weighs over 100 tons. These incredible dimensions are calculated from archaeological remains, not from the ancient sources. (For a summary description of archaeological features associated with this Herodian retaining wall, see Ritmeyer 1989.)

Although Herod did not tamper with the dimensions of the Temple proper, nor, it seems, with its internal furnishings, he did choose to outdo Solomon in golden embellishments of the building's exterior and in the scale of the courtyard furnishings. See Fig. TEM.04. The result was an awesome structure. According to Josephus, the outside of the Temple was adorned with so much gold that, when the sun shone upon it, it virtually blinded those who looked at it. The grandeur of the whole complex of courts, buildings, and porticoes led rabbinic sources to proclaim that "No one has seen a truly beautiful building unless he has seen the Temple" (*Sukk.* 51:2).

The task of building the Temple, its platform, and all its attendant structures began in the eighteenth year of Herod's reign (20 B.C.E.). Elaborate preparations and planning preceded the actual work and the dismantling of the existing Second Temple. Careful not to offend the religious sensibilities of the local populace and their concerns about the purity and holiness of the site, he arranged for a large workforce (1,000 men, according to Josephus) of priests to supplement the much larger labor pool, estimated at tens of thousands of workers. The priests were specially trained in construction work and masonry so that they could carry out the work on the sacred areas where the general public could not tread.

Herod was also careful not to have the existing temple building demolished until everything was ready for its successor to be erected. Thus the new Temple, because of its relatively small size and the

meticulous preparations for its construction, was completed in a remarkably short period of time, about eighteen months. But the whole project took a great deal longer to complete. The ancient sources are not in agreement about how long the building operations continued. The Gospel of John (2:20) indicates that the project took 46 years, well beyond Herod's life-time (cf. *Sanh.* 41.2 and *ʿAbod. Zar.* 8.2). Josephus (*Ant* 20.219) indicates that final embellishments and even repairs on components finished earlier in the project's duration took place virtually to the time of the Great Revolt, when Titus and the Tenth Legion Fretensis turned the magnificent holy compound into smoldering uninhabitable ruins in the year 70 C.E.

H. Future Temple

The destruction of the largest, grandest, and shortest-lived of the Jerusalem temples hardly brought about the demise of the temple idea in the religious communities emerging from Jerusalem. Both Judaism and Christianity, albeit in distinct ways and to different magnitudes, responded to the end of the earthly temple with ideas about its future existence. Both of these traditions had, in their formative stages, witnessed the Temple's glory and had been profoundly affected by its presence in Jerusalem; both of them were forced to consolidate their constituency and reorder their beliefs in the wake of the calamitous religious and political changes that swept over Palestine in the wake of the Roman armies.

For Christianity, which had barely emerged with a distinct religious identity by the year 70, the adaptations to the loss of the Temple were far less complex than for Judaism. The two major figures of earliest Christian tradition, Jesus and Paul, had both been in the temple precincts, though not in the temple building itself. The earliest Christians in Jerusalem apparently continued to participate in temple ritual (Acts 2:46; 3:1). Still, the experiences of Jesus and Paul at the Temple and with various personnel had been fraught with tension (see, e.g., Mark 11:12–19; 14:53–65; Acts 26:21). Jesus is even said to have proclaimed the eventual and eschatological destruction of the Temple (Mark 13:1–2).

Such experiences may underlie in part the fact that the early church at the end of the 1st century and later placed no emphasis on the notion that the Temple might one day be restored. Pragmatic reasons, too, may have influenced antipathy toward the temple idea. It would not have been advantageous to be aligned with the Jews and their hopes to restore the Temple when the Roman armies had perpetrated and celebrated its devastation. In any case, the eschatological visions of the early Christians had no place for a fourth temple. The visions in Revelations of a celestial Jerusalem, a city of gold and jewels, partakes of cosmic temple language with its references to a "great high mountain" (Rev 21:9) and the "waters of life" (Rev 22:1).

Yet the new Jerusalem would not have a temple (Rev 21:22). In the Byzantine period, when Jerusalem was largely a Christian city, no steps were taken, despite the flurry of construction work that characterized the 4th to 6th centuries, to clear the ruins on the Temple Mount let alone to restore it. On one level, the presence of the ruins may have been seen as witness to the validity of Jesus' prophecy that the Temple would be destroyed. On another level, there were strong theological reasons for the neglect of the temple building. The Christian understanding of Jesus' life, death, and resurrection drew on Jewish ideas of sacrifice and transformed them. The ongoing cycle of sacrificial offerings and especially the annual sin offering were epitomized and fulfilled, once and for all, by the sacrifice of Jesus' life. Jesus' entry into the eternal Temple on behalf of humanity ruled out forever the need for further sacrifices at either an earthly or a heavenly temple (see Heb 8:10). The crucifixion of Jesus in association with the Passover meant an understanding of his death in terms of the slaughter of the Pascal lamb and, by extension, in terms of the full sacrificial component of the Temple.

In contrast, the loss of the Holy Place in Jerusalem did not bring about a shift in its centrality for Judaism. In the 6th century B.C.E., Israelite political autonomy had disappeared, but the rebuilding of the Temple under Zerubbabel had provided a focus for a reconstituted and hierocratic community that transcended territorial and political boundaries. The Temple had been a force for survival. Yet, even without an earthly temple, the centrality of such a structure continued for the Jews of antiquity. It could continue to function that way because it had never been understood and defined only by is physical shape and its concrete nature (Levenson 1985: 178–84). From the very beginning, under the aegis of David and Solomon, the temple conception involved a continuum from heaven to earth. It bore meaning that

transcended its material reality. It was a cosmic structure and it involved covenant/Torah. The removal of the earthly component did not detract from its heavenly existence, nor from the dynamic reality of the Torah.

Because the Temple had never been fully mundane, it could never be completely destroyed. It continued to exist in Judaism in present reality through Torah. At the same time, its structural conception persisted in the hope that it would one day be rebuilt on earth. That fervent hope for the restoration of the Temple gave rise, in late antiquity, to three separate attempts at rebuilding. The first, in connection with the Bar Kokhba Revolt (132–35 C.E.), is documented largely through the fact that several coins minted by the ephemeral rebel government depicted the facade of the Temple. The interest of the Jewish insurgents in rebuilding the Temple was no doubt provoked by the acts of Hadrian, who set out to make Jerusalem a Roman city. His founding in 130 C.E. of *Colonia Aelia Capitolina*, as Jerusalem was to be called, may well have included the beginning of work on a temple to the Capitoline Triad (Jupiter, Minerva, and Juno) a project that was carried out once the rebellion was quelled in 135.

Another attempt to restore the Temple was also provoked by Rome, but this time through the emperor's encouragement. Julian "the Apostate" strove to weaken the ties between Rome and the Christian church and to strengthen pagan religions. As part of this plan, he tried to disrupt the Christian character of Jerusalem in 362–63 C.E. by allowing Jews, who had been banned from Jerusalem since Hadrian's reign, to resettle the Holy City and even to restore the Temple. It seems that work on the building actually was initiated—only to be abandoned when Julian died in 363.

A final effort to re-establish the Temple came about near the end of the Byzantine period, when the Persians gained control of the Holy Land in 614 C.E. The Persians were favorably disposed to the Jews and gave them control over Jerusalem, an act that apparently sparked plans for temple building. However, it soon became clear that the Persians should not slight the Christian majority. Jerusalem was returned to Christian control, a status secured when the Emperor Heraclius restored Palestine to Byzantine rule in 629 C.E.

These futile efforts at temple restoration in the centuries after the destruction of 70 C.E. perhaps only served to increase the eschatological aspects of the Temple's reality. If it couldn't be rebuilt historically, it surely would be part of the world-to-come. Yet at the same time, these rebuilding efforts punctuated and no doubt stimulated the intense consideration of temple matters that characterized rabbinic Judaism.

Whether the interest in temple building was eschatological or not, the centuries immediately after the events of 70 C.E. meant an outpouring of popular and scholarly energy into temple matters. With all its rituals, festivals, officials, and structural aspects, the Temple was the focus of much of the discussion of the sages of postbiblical Judaism. In their fervent hopes and beliefs that they would regain Jerusalem and the Temple Mount, they took pains to retain and clarify all the information that would be necessary to rebuild the Temple and restore its service according to divinely ordained specifications.

These discussions by generations of scholars were preserved in the Mishnah, in the Jerusalem and Babylonian Talmuds (up to the 6th century C.E.), and also in the homiletic literature (Midrash) recorded up to the 10th century. The obsession of the Jewish sages with being prepared for a rebuilt Temple meant the preservation of a wealth of information about the last of the Jerusalem Temples as well as about the general way of life in Jerusalem before it fell to Rome.

The Jewish response to the great destruction meant continuity of the temple idea; yet it also involved radical institutional change. Preexilic Israel had its Temple and palace; postexilic Judaism had its Temple and priesthood. Postdestruction Judaism had neither—but it had its synagogue, the origins of which are shrouded in uncertainty. Much has been made about the relationship between Temple and synagogue, to the extent of supposing that the latter is hardly more than surrogate of the former, with prayer the equivalent of sacrifice.

While it is inevitable for parallels or lines of continuity to be drawn between Temple and synagogue, there are fundamental differences between the two (Cohen 1984). Linking them does a disservice to the synagogue which, as a democratic and scholarly institution of the people, is a true creation of Judaism, whereas the Temple as a dwelling place for God and as maintained by a hierarchical and elitist personnel

was a creation of the ANE world from which Israel emerged. By their very nature, the multiplicity of synagogues scattered throughout the Jewish dispersion precluded the participation of such buildings in the cosmic imagery of the sacred center that was the essence of the Jerusalem Temple.

The survival of the Temple in Christian conceptions of Jesus as the sacrifice that secured eternal redemption and in Jewish images of an eschatological Temple does not exhaust the ways in which the Temple endured beyond 70 C.E. As a visual object that endured for nearly a thousand years in physical reality, it has persisted for another two thousand years in artistic conceptualizations. Graphic representations of the Temple began to proliferate almost from the moment it was reduced to ruins. Representations of the temple building and of its furnishings were used to adorn mosaic floors, bronze and silver coins, ceramic lamps, stone sarcophagi, tomb paintings, gilded glassware—practically every available artistic medium of antiquity. Beginning in the medieval period if not earlier, biblical, liturgical, and scholarly manuscripts were illuminated with depictions of temple treasures. Ceremonial religious objects were inspired by what were deemed to be their temple analogues. And of course many of the masterpieces, as well as lesser works, of European sculpture, painting, and engraving included depictions of the Temple in their portrayals of biblical themes.

Finally, the modern scholarly explorations of biblical lands and texts (see above), which overlap to some extent with visits of pilgrims to the Holy Land, have given rise to a plethora of detailed architectural reconstructions and of actual models. In the 19th and 20th centuries, biblical scholars, archaeologists, and architectural historians have produced countless graphic representations of all three of the Jerusalem Temples. Some of these are little more than fanciful projections; others have shown painstaking attention to every possible source of information. Perhaps the most elaborate reconstruction of all is the scale model of the entire Herodian city built on the outskirts of Jerusalem (Holyland Hotel) in the 1960s under the guidance of the late Professor Avi-Yonah.

In the two millennia since the Temple was destroyed, generation after generation of draftsmen, painters, archaeologists, artisans, photographers, and scholars have sought through a variety of graphic modes to reconstruct this ancient building. The motivations which led to the construction of the three successive temples in Jerusalem have been perpetuated in part by these manifold postbiblical efforts to simulate and so to comprehend the visual expression of a nonmaterial reality.

Bibliography

The literature dealing with the Jerusalem Temple is vast. Extensive bibliographies can be found in reference works, such as *IDB* 4: 434–50 and *EncJud* 15: 942–88, and in the comprehensive treatment of Busink (1970–80). The following list includes works specifically cited as well as a sample of publications that have appeared in the past two decades.

CAROL MEYERS

TEMPLES AND SANCTUARIES. This entry consists of four articles that survey temples and sanctuaries in the ancient world of the Bible. The first focuses on temples in ancient Egypt, and the second focuses on temples in ancient Mesopotamia. The third focuses on temples in Syria and Palestine during the biblical period, while the fourth surveys Greco-Roman temples. See also TEMPLE, JERUSALEM.

EGYPT

Egypt can truly be called a land of temples. From the great sprawling complex of the Amon temple at Karnak to the tiny shrines found along village streets, temples and sanctuaries devoted to the cults of the gods were a dominant feature of every city and town. Hundreds are mentioned in the texts (Helck 1960b) though a relatively small portion have actually been discovered. In the cemeteries, hundreds more, in the form of royal funerary temples and chapels for private mortuary rituals, were part of the tombs of both kings and commoners. These two kinds of temples—cultic for the gods, funerary for mortals—dotted the Egyptian landscape and were an integral part of Egyptian life. The functions they performed went far beyond religious ones. Religion was not a separate category of thought in ancient Egypt, but pervaded every aspect of society and culture. Temples were therefore deeply involved in what we would term secular life.

A. Introduction
    1. Cult Temples
    2. Funerary Temples
B. Temple Personnel
C. Economic Functions of the Temple
D. Other Non-cultic Functions

———

A. Introduction

1. Cult Temples. The cult temple was first and foremost the home of a deity and thus the point of contact between that deity and the mundane world of man. The cult temple as a building symbolized the divine creation of the universe. It represented the eternal existence of an ordered universe as opposed to the chaotic forces which, according to myth, once attempted to destroy that order. This struggle between order and chaos—that is, good and evil—was part of all ancient thought, including that of Egypt. The cult temples of the land, built of stone to last "for eternity," stood as a constant reminder of the inevitable triumph of good.

The cult temple as an institution provided the vast and complicated ritual by which a deity was worshipped. The essential goal of worship was to coax the deity into positive action on behalf of the community. All deities could bestow or withhold their largesse as they pleased; temple ritual was geared to pleasing them so they would act favorably. Because of its primary function as the house of a god, the building itself was erected only after an important foundation ritual. This can be traced from the early 3d millennium B.C. to the Ptolemaic period. The ceremonies lasted up to two weeks with the participation of the king and priests representing various deities (Montet 1964).

Three cult temples with long histories, each noted for its prestige and wealth, played a dominant role for many centuries (Helck 1960a). The largest of all Egyptian temples was that of Amon-Re, king of the gods, at Karnak (Thebes), begun ca. 1550 B.C. and enlarged and repaired over the next 15 centuries. Within its precincts were 26 chapels for deceased kings and 34 temples of varying size dedicated to other deities. The other two major temples were those of Re the sun god, at Heliopolis, and Ptah, an old god of craftsmen and creation, at Memphis. Both also included numerous other temples for kings and gods. The dominance of these cult places arose because Thebes and Memphis were Egyptian capitals; Heliopolis was originally the cult center of Atum, one of the oldest and most revered deities of the pantheon, who was superseded at this site by the sun god Re in the 3d millennium B.C.

A list of the more important cult centers would be too long for the present context, but a few are worthy of mention. Abydos, the holy city of Egypt to which Egyptians went on pilgrimage, was the traditional site of the burial of Osiris, the ruler of Paradise. The Osiris temple, one of the most splendid buildings in Egypt, was erected by Seti I (1303–1289 B.C.). A major temple to Horus, son of Osiris and protector of the living king, stands at Edfu. See Fig. ART.21. While this is of Ptolemaic date, the temple existed long before as shown by the numerous priests of this temple mentioned in earlier texts. The great temple of Elephantine was dedicated to the chief guardians of the first cataract of the Nile—Khnum, Satis, and Anukis. And, of course, there is the once magnificent temple to the Aton at El Amarna used for only the few years of Akhenaton's reformation.

Among other temples for major deities were those of Thoth, god of writing and knowledge, at Hermopolis; of Montu, god of battle, at Armant; of Min, an early fertility deity, at Coptos; and many others. This does not mean that these and other deities were worshipped only at those towns at which they were most closely associated. The greater deities such as Amon-Re, Ptah, Horus, Osiris, and Thoth, had temples and shrines throughout the land, and even abroad, especially in the Hellenistic period. With the advent of Egyptian imperialism in the period 1540–1100 B.C., temples to Egyptian gods arose in Nubia, the Sudan, and Palestine (Giveon 1978: 22–27). Hathor, goddess of motherhood, was a particular favorite of Egyptians living abroad with temples in such foreign places as the southern Sinai, Byblos, the Wadi Timnah, and Nubia.

2. Funerary Temples. Funerary temples, which otherwise had much in common with the houses of the gods, had a different primary function. Whether a large complex built for a king's pyramid or a tiny chapel in an artisan's tomb, the funerary temple served to perpetuate the eternal existence of the human soul. Ritual and ceremony played a major role in assuring the soul of food and drink and the other necessities of continued existence in the afterlife. Moreover, the funerary temple was the point of communication between the soul of the deceased and the living. Just as the living communed with gods in the cult temples, they communed with the dead in the funerary temples. For the souls of the dead, now living in the realm of the supramundane and in direct contact with the gods, could also act on behalf of the

world of the living. Innumerable texts show that the souls in Paradise were called upon to intercede in the affairs of men. Among these are letters written to deceased relatives and placed in their tombs which call upon them to help solve personal and household problems (Gardiner and Sethe 1928). There are also graffiti and monuments left by visitors to tomb chapels in the hope that the soul of the deceased will intercede for them (Davies and Gardiner 1920; Alliot 1937–38). This was in direct response to the "Appeal to the Living" frequently found in tomb texts in which the deceased promises such intercession for any passerby who makes offerings or says prayers on behalf of his soul.

Royal funerary temples developed out of the tiny structures of the Archaic period (ca. 3200–2700 B.C.) which became larger and more complex with the construction of pyramids during the Old and Middle Kingdoms (ca. 2575–1630 B.C.). During the Empire period (1540–1075 B.C.) and later, royal funerary temples were built along the western fringe of the Nile Valley opposite Thebes while the actual tombs were hidden away behind them in the Valley of the Kings. The temples at Deir el-Bahri (Thutmose III and Hatshepsut), the Ramesseum (Ramesses II), and Medinet Habu (Ramesses III) are examples of such royal funerary temples.

The funerary chapels of commoners likewise had humble beginnings. The solid, bench-shaped mastaba tombs of the Archaic period were decorated with vertical niches on all four exterior walls. One of these niches, always at the S end of the wall facing the Nile, was designated as the focal point where prayers and offerings were made for the deceased. The next step was a tiny exterior chapel at the same point on this wall. By the time of the Old Kingdom, chapels were built into the superstructure of the freestanding mastaba type tomb or, in the case of tombs cut into the mountainsides along the Nile Valley, quarried out of solid rock. Burials associated with these chapels were in simple underground chambers hidden from view. This practice continued for the rest of Egyptian history.

All funerary temples and chapels were open to the public which considered them as readily accessible points of contact with human intercessors, now in the divine realm. Certain royal funerary temples and even tomb chapels of commoners became particularly venerated over long periods of time as being shrines more efficacious than others. Their walls are covered with the graffiti of ancient visitors calling upon the deceased to intercede for them with the gods.

B. Temple Personnel

The wide range of religious and secular functions of the temples required a variety of personnel to carry them out (Sauneron 1960). The number of people attached to a temple varied from a single priest to many thousands of priests and lay workers, depending on the size of the sanctuary and the extent of its property. In the larger temples, a substantial part of the staff was concerned with administering and caring for fields and crops, gardens, animal herds, granaries, housekeeping, and the copious written records of daily life. This administrative staff was made up mostly of lay persons, though priests could also be appointed to such duties.

The actual work of these enterprises was carried on by a large number of workers. Peasant families tilled the fields and watched over the numerous flocks. Craftsmen of all kinds manned the workshops that produced the myriad cult objects and the necessities of everyday life for the entire temple community. There were doorkeepers and guards, butchers and bakers, and the artists, sculptors, and stone masons who kept the temple precinct in repair. Each temple department such as the granary or the treasury had its own cadre of caretakers, scribes, and workers. Like any large noble estate, the temple was self-supporting and employed whatever staff was necessary to supply and care for all its needs.

The continuous ritual and ceremony carried on throughout the year was the domain of the priests. It is difficult to establish a strict religious hierarchy since clerical offices varied in importance and function in different temples. There were basically two priestly classes: the "God's Servants," divided into five grades, and the "Purified Ones," the innumerable ordinary priests, also divided into several grades which cannot yet be clearly defined.

It was from the higher ranks of the God's Servants that the leaders of the clergy were drawn. High priests held the title "First God's Servant." Such men were among the most important in the land, especially the high priests of the gods Amon-Re at Thebes, Ptah at Memphis, and Re at Heliopolis. From

about 1500 B.C. on, the single most-powerful cleric in Egypt was the high priest of Amon-Re who belonged to the inner circle of royal advisors. Controlling vast wealth and the allegiance of the people, this priesthood was a significant political competitor to the royal family. Akhenaton's failed reformation in the later 14th century B.C. was an attempt to curb the influence of this priesthood which ultimately assumed the rule of Upper Egypt around 1075 B.C. The temple and state, theoretically expected to work in tandem under the divine kingship, were often in opposition as to who was in control.

There were many classes of priests who specialized in only one aspect of temple service. Among these were the lector priest, responsible for learning and reciting the vast ritual literature; the stolist, who cared for the clothing and other paraphernalia of divine statues; astronomers who kept track of time by observing the heavens and using water clocks and other time-keeping devices; priestly scholars and scribes in the temple's "House of Life" (the scriptorium/library) who accumulated and interpreted the sacred writings; singers and musicians who played a significant role in temple ceremonies; and, in later times, astrologers who read the fate of the nation and the individual in the stars.

The role of women in the priesthoods was minor for much of Egyptian history. Generally, they served as priestesses of the goddess Hathor or some local female deity. It was not until the later Empire period, when Amon-Re came into such preeminence, that women took on important positions in that cult. Women were also prominent in ceremonial singing and dancing. However, the place of women in the priesthoods seems always to have been subordinate to that of men, even with the Hellenistic Isis priestesses.

C. Economic Functions of the Temple

The most significant secular function of the temple was in the economic sphere. Janssen (1975, 1979) suggests that the Egyptian economic system was based on a local subsistence economy in which the necessities of life were produced in all sectors of society without particular concern for the open marketplace. Any surplus was collected by state institutions and redistributed among the host of government employees not directly involved in production, from high officials to ordinary workmen.

The temples were involved at both levels. Like any other sector of society, the temples produced the food, clothing, and other necessities required by their personnel. When the state collected the nation's surplus products, the temples were used as storage depots and centers for the redistribution of this surplus. In the early centuries of Egyptian history, temples were small and without great wealth. From the Old Kingdom on, royal grants and private donations gradually expanded temple property which meant a commensurate increase in agricultural laborers, craftsmen, and other workmen needed to maintain the temple's subsistence economy.

The real growth of temple wealth came during the Empire period (ca. 1540–1100 B.C.) when foreign conquests created an enormous surplus of manufactured goods in the form of booty and tribute as well as new agricultural land. It has been convincingly argued (Janssen 1979) that the cult temples formed one of many branches of government and were not institutionally or economically independent of the state. The extraordinary wealth of the larger temples must thus be seen in a new perspective. The royal "gifts" to temples were not outright grants of land, produce, objects of precious metals, and the like. This was rather the placing of state property in the hands of one of several government institutions (like the state treasury) to be recalled and used when the government wished to do so. State employees such as the royal workmen in the Valley of the Kings were paid in kind by the state out of temple treasuries. The temples thus acted as a kind of banking system for the state and paymaster for government workers.

Offerings to the gods also played a role in the redistribution of surplus goods. The food, clothing, and a host of other items presented to the gods in sometimes massive quantities were reused by the living once the service to the gods had been satisfied. Such offerings were a major source of income for the temples and were used, for example, to support the families attached to temple service in one way or another.

D. Other Non-cultic Functions

One important aspect of temple activity lay in the area of formal education which was directed by the priests within the temple precinct. It is safe to say that all educated males working in any capacity were trained in the temple schools. (The rare literate women probably received private tutoring outside the

temple.) Temple education may partially account for the fact that, with few exceptions, Egyptian officials at all levels bore priestly titles of some kind or other. Many professions such as medicine and astronomy were almost totally the domain of the priests. The temple of Neith at Saïs in the Delta was especially noted as a center for medical education.

Temple libraries housed archives of substantial proportions though, being of papyrus rolls, most have long since disappeared. The list of documents once filed in temple libraries embraces the entire spectrum of human knowledge: political, religious, scientific, economic, and legal (Redford 1986: 215–24). For example, a summary of every trial, even those held in village courts, was preserved in the temple archives. Papyri recording property ownership were kept there and, in one famous case, the litigants were able to obtain copies of the pertinent documents stretching back over two and a half centuries. The temples were thus the repositories of all the accumulated knowledge of Egyptian civilization. It was in such a temple library that Manetho, an Egyptian scholar of the 3d century B.C., studied and wrote his history of Egypt, excerpts of which were quoted by other historians for centuries.

The vast expanses of temple walls provided a public library cataloging the exploits of Egyptian kings. Here were carved in stone the records of foreign wars and other important events, the so-called "annals" of the empire and later, where succeeding Pharaohs recorded what they had accomplished on behalf of the gods. The campaigns of Thutmose III (1490–1436 B.C.), detailed accounts of the Battle of Kadesh under Ramesses II (1268 B.C.), the wars of Ramesses III (1184–1153 B.C.), and the last successful Egyptian campaign into Palestine under Sheshonk I (945–924 B.C.), are among the many exploits recorded on temple walls. The temples were chosen as the medium to record these events since kings were boasting to the gods; temples were made of stone so the boasting would last forever.

In Ptolemaic times, certain temples—notably those at Dendera, Saqqara, Deir el-Bahri, and Abydos—included sanatoria where the sick went to find cures under the aegis of deities of healing such as Hathor, Serapis, and Bes. Two deified commoners were also associated with healing in late times: Imhotep at Memphis and Amenhotep, Son of Hapu, at Thebes (Wildung 1977). Both had been royal architects who came to be venerated as patrons of the intellectual arts, and ultimately, as popular gods of healing. While actual sanatoria are known only from the late period, deities of healing are mentioned in earlier texts which suggests that centers of healing probably had an earlier history.

Oracles, divine answers to specific questions, also lay within the scope of temple activity (Černý 1962). Recorded oracles range from queries about vital state concerns such as the royal succession, to personal problems like the theft of a sheep from a farmer's barnyard. Oracles were sought in the great temples as well as at village shrines. By the 20th Dynasty (1190–1075 B.C.), divine justice via oracles had become a popular substitute for human justice in the regular law courts. Dream omina, a common type of oracle, were obtained through the temple priests under controlled conditions since dreams were considered to be messages from the gods.

Egyptian temples thus had many functions and existed to serve several purposes. They were the houses of the gods, the points of communication between gods and men, keepers of education and libraries, important economic institutions, and eternal recorders of the deeds of Egyptian kings. In the later years of the empire, during the 20th Dynasty, some, like the funerary temple of Ramesses III at Medinet Habu, took on another function. Incursions of Libyan tribes from the desert into the Nile Valley and rebellious mercenaries made life dangerous in Thebes and the villages around the city. The temples became fortresses in which the local population could find safety from rampaging foreigners. It was fitting that the temples which protected men's souls should offer them physical protection in time of temporal need. See also *LÄ* 6: 365–76.

MESOPOTAMIA

Beginning with the pioneering excavations of the late 19th century, archaeologists have recovered the remains of monumental structures more or less conclusively identifiable as temples at many sites in both S Mesopotamia (ancient Sumer and Akkad, later Babylonia) and N Mesopotamia (Assyria and the Jazirah). The remains of temples and, in some instances, the associated staged towers known as ziggurats have been discovered in Babylonia at such important cities as Eridu, Uruk, Ur, Nippur, and Babylon; and in Assyria and the N at Assur, Mari, Calah, Tell Rimah (possibly ancient Karana), Tell Brak, and in the last several years, Tell Leilan (ancient Shubat-Enlil) (see Weiss 1983). These remains date from as early as the early 5th millennium B.C.E. (at early Ubaid-period Eridu) to the mid-1st millennium B.C.E. at Babylon.

B. Origins and Evolution of the Temple
C. Social Role of the Temple

———

A. Archaeological and Textual Evidence

The ancient Sumerians, Babylonians, and Assyrians built their temples (as well as other "public" buildings and "private" houses) principally with sun-dried mud brick (although beginning in the late 3d millennium B.C.E. kiln-fired brick, frequently set in bitumen, was increasingly used, especially in constructing facades). This choice of material was forced upon them by the lack of proximity to more durable materials such as stone and large timber, especially in the Tigris-Euphrates floodplain of S Mesopotamia. Consequently, then, while the gigantic stone temples of Egypt have stood majestically for millennia, the great temples and ziggurats of Mesopotamia have crumbled into massive, amorphous mounds of decayed mudbrick. Even during their heyday, these structures required frequent replastering and other maintenance. Moreover, they were frequently demolished and reconstructed because (as is amply attested by numerous royal dedicatory inscriptions, year names, and self-laudatory royal hymns) it was considered the pious act of the dutiful ruler, acting as the god's steward, to undertake such reconstruction, and to do so on the same sanctified spot. This process usually entailed the demolition of the temple's existing walls, leaving only wall stubs often only a few inches high, that were then filled in with wall rubble (and, in at least one instance, old clay tablets) to create a platform upon which the new temple was erected. As a consequence, archaeologists excavating the remains of great urban sites that were inhabited more or less continuously for centuries (sites such as Ur, Uruk, and Babylon) have been confronted with long and complicated sequences of wall stubs superimposed upon and sometimes intersecting each other. Relatively little is known about how these structures were roofed (although some important evidence in this regard has been recovered from the Old Babylonian (OB) period temple at Tell al-Rimah; see Oates 1979: 80–82; Lloyd 1978: 167–69); indeed, for some types of temples uncertainty continues as to whether certain areas were roofed or unroofed.

Finally, especially for the late 4th and 3d millennia B.C.E., additional evidence concerning the construction and appearance of temples is provided by cylinder seals and the remains of their impressions,

by representations on stone vases and troughs, by actual models of temples and houses, by house plans incised on clay tablets, and by painted decoration on pottery (note especially Crawford 1977: 65–76).

The textual evidence regarding Mesopotamian temples tends to be much more tractable, although its interpretation is fraught with its own peculiar difficulties. Various temples and their attributes were celebrated in "temple hymns" (e.g., Kramer 1957; *TCS*3), and the destruction or desecration of famous temples at the hands of invaders or sacrilegious rulers was mourned in lamentations (see Kramer 1988). More pious rulers boasted of their reconstruction or embellishment of temples, or of donating cultic paraphernalia such as statues, chariots, or weapons to them, in commemorative and dedicatory inscriptions (see, for example, Sollberger and Kupper 1971 and Klein 1989), year formulae, and royal hymns. Undoubtedly the most celebrated inscription of this type (and one of the masterpieces of classical Sumerian literature) is that of Gudea, ruler of the Sumerian state of Lagash, who ca. 2000 B.C.E. caused two large cylinders to be inscribed with the account of his rebuilding of the Eninnu, the temple of the god Ningirsu, a warrior god who was the patron deity of Girsu (modern Tello, formerly thought to be the site of the ancient city of Lagash, now to be identified as Tell el-Hiba) (see Falkenstein 1966 and Kramer 1988). In sheer volume of material, however, the overwhelming majority of the textual evidence relating to temples consists of thousands of inscribed clay tablets that constitute the remains of the formerly vast archives of various temple households of S Mesopotamia. These administrative records consist chiefly of accounts of transactions and expenditures. They are inscribed in an often-cryptic bureaucratic argot that includes designations of rank or profession and terms for commodities that, in some instances, have yet to be adequately translated. Nonetheless, these records indisputably have yielded the most important evidence for assessing the wealth and socioeconomic power of the temples and the scope of their economic affairs, and for elucidating the bureaucratic processes and the hierarchy of personnel that administered the gods' estates and households. Among the more noteworthy archival remains recovered to date are the account texts from the Late Uruk period (late 4th millennium B.C.E.) levels of the Eanna temple precinct at Uruk. Written in a pictographic script that is a direct precursor of cuneiform writing, these clay tablets contain the earliest known evidence of writing, which evolved from the need to maintain accurate records of the increasingly complex and sophisticated Uruk temple household(s). Other major archival collections that have survived include the Early Dynastic (ED) III period (mid-3d millennium B.C.E.) archives of the temple of the goddess Bau at Girsu; the Ur III period (i.e., Third Dynasty of Ur, late 3d millennium B.C.E.) records of the temple of Inanna at Nippur; the Isin-Larsa period (early 2d millennium B.C.E.) archives of the Eshumesha, the temple of the god Ninurta at Nippur; and the Neo-Babylonian (NB) period (mid-1st millennium B.C.E.) archives of the Ebabbar (the temple of the sun god, Shamash) at Sippar and of the Eanna temple at Uruk. Unfortunately, none of these archives is complete. The extant records from each of them represent the activities of only certain parts of the temple household and document those activities for only limited periods. Of course, the archives of many of the great temples of Babylonia and Assyria—not to mention the temples themselves—await discovery.

B. Origins and Evolution of the Temple

The earliest sacred shrines of ancient Mesopotamia have never been found, and undoubtedly never will be discovered, for they were most likely constructed of reeds or some other similarly ephemeral material. Exactly why the earliest shrines were built probably can never be satisfactorily answered, although some current hypotheses would link their origins to the emergence of "tribal" ceremonial centers or treasuries among the pre-urban groups of S Mesopotamia (Wheatley 1971: 226–29; Jacobsen *EncRel* 9: 447; but see Oates 1979: 24). With regard to N Mesopotamia, some experts have attempted to identify a structure of "unusual" ground plan at the site of Hassuna or the so-called "tholoi" at village sites of the Halafian period (early to middle 6th millennium B.C.E.) as sanctuaries, but the evidence is extremely inconclusive.

In the eyes of most scholars, the earliest structures that can be identified with some probability as temples date to the early Ubaid period (early 5th millennium B.C.E.) and are to be found at Eridu in S Mesopotamia and at Tepe Gawra in the N, although at least one scholar (Aurenche 1981: 51) has cautioned that one might just as validly identify these structures as community houses. The structure at Eridu was built of mudbrick and is commonly regarded as the earliest example of "monumental"

architecture in Mesopotamia. Beginning as a small rectangular structure, the Eridu Ubaid temple evolved to comprise a central rectangular sanctuary with wall niche (presumably for the god's statue or symbol) and central "offering table," with lateral wings projecting from the central sanctuary to form a T-shape. The exterior facade was ornamented with alternating buttresses and recesses, and the entire structure stood on a platform or terrace. These attributes mark the Eridu Ubaid temple as a probable prototype of subsequent Mesopotamian religious architecture. The continuity of tradition that eventually characterized this architecture is likewise well exemplified at Eridu: the Ubaid temple lay under the great ziggurat built for the Sumerian god Enki, the patron deity of Eridu, almost 2,000 years later by the kings of the Third Dynasty of Ur.

The explosion of urban development in S Mesopotamia during the 4th millennium B.C.E. was paralleled by the construction of more elaborate temples that in some instances were set on even higher platforms. In the Eanna temple precinct the city of Uruk (biblical Erech, modern Warka) in particular were built structures as large as 275 by 175 feet, including one structure (the "Hall of Pillars") the exterior of which bore the remains of colorful "cone mosaic" decoration. Although even these buildings perhaps cannot yet be identified unequivocally as temples (see Nissen 1988: 96–97), the discovery of hundreds of account tablets dating to this period (ca. 3000 B.C.E.) surely indicates that the temples must have been located in this area. Incised with an early pictographic script, the direct ancestor of cuneiform writing, these tablets also reveal that at the dawn of literacy the temple households of Uruk already commanded abundant resources in livestock and agricultural commodities and supplied grain rations and other support to numerous dependants.

Between the end of the 4th millennium and the end of the 3d millennium B.C.E., both textual and architectural data reveal that the temples became the foremost centers of the cities of ancient Sumer. The vast majority of the temple archival remains for this period come from the city of Girsu. They attest to the great economic resources (for example, the estates of the goddess Bau alone comprised 11,000 acres) and complex bureaucracies of the temple households. The Girsu temple estates in general produced commodities such as wheat and barley, dates, vegetables, cheese and other milk products, oil, dried fish, wool, hides, and reeds; and they employed men and women (and children, as well) of many different crafts and professions, including bricklayers and carpenters, smiths and masons, spinners and weavers, butchers and bakers, farmers and fishermen, shepherds and swineherds. These records and other "historical" documents of this period, however, also reflect the ongoing encroachment by local and then "imperial" political/secular authorities (in particular, the Akkade Dynasty and the Third Dynasty of Ur) on the wealth and prerogatives of the temple households. By the 18th century B.C.E., this trend culminated in an increasing "secularization" of the temple as Hammurabi and his successors exerted more and more control over temple property. Throughout the remainder of ancient Mesopotamian history, the temples remained vital components of the socioeconomic fabric of Mesopotamian urban society, but their economic autonomy tended to be compromised by various rulers' needs for revenues. At the same time, however, the Mesopotamian ideology of kingship required that a king's rule be sanctioned by divine authority. This need gave kings good reason to curry the favor of temple priesthoods and administrators (many of whom came from the ranks of influential local families) and to assist them in maintaining the temples' prestige. Thus, the temples continued to benefit from royal endowments, and the citizens of cities with especially ancient and prestigious temples (such as Nippur and Babylon) were frequently granted royal privileges that might include exemption from conscription and taxes (see Kraus 1954: 535–36). To fend off later kings' attempts at encroachment, the temples could resort to claims of ancient privilege and protected status and, undoubtedly, to the political savvy of temple officials.

From an architectural standpoint, the period after 3000 B.C.E. witnessed the appearance of several different types of temple ground plans. Excluding temples known only from textual evidence (such as the Tummal shrine of the goddess Ninlil, which most scholars have located in Nippur, although now see Yoshikawa 1989) or temples for which an earlier ground plan was destroyed by rebuilding (such as at the Ekur, the much-celebrated temple of the god Enlil, also at Nippur), at least five different types of temple ground plan can be discerned before 2000 B.C.E. in S Mesopotamia (Crawford 1977: 22–26). The evident

lack of standardization of ground plans has led at least one scholar to speculate that different temple plans were appropriate to different gods. Thus, of the four oval temple enclosures known for this period, two of them (at al-Ubaid and al-Hiba) are known to have been dedicated to female deities (Ninhursag and Inanna, respectively); on the other hand, of the five known temples of the "house plan" type, three were dedicated to female deities and two to males (Crawford 1977: 25, 84–86). Using a criterion based on verticality as opposed to horizontal ground plan, however, the temples of S Mesopotamia during this period can be grouped into two basic categories: "high" temples on a platform or ziggurat (for the planning and appearance of which the evidence is quite meager) and "ground-level" temples. Whatever the peculiarities of their ground plans, the ground-level temples share, for the most part, certain basic elements, in that the main sanctuary (the cella) was rectangular, with a door in one of the long sides and a brick altar at one end (thus producing the so-called "bent-axis approach"). Behind the altar was a wall niche in which would have stood the cult statue. The sanctuary was also furnished with small brick pedestals (presumed to have been offering tables) and, along the walls, brick benches upon which the votive statues of pious donors would have stood (see Lloyd 1978: 118–20). Many of these features, including the bent-axis approach, are to be found in temples of N Mesopotamia during this period (including the "Archaic Ishtar Temple" at Ashur and the Ishtar Temple at Mari).

By about 2000 B.C.E., however, two new features that were to endure for centuries became established in Mesopotamian religious architecture. The bent-axis configuration was now, for the most part, replaced in Babylonia by the "direct-axis" approach, a more symmetrical layout that resulted in an aligned vista from a paved courtyard, through perhaps an antecella, that terminated with the cult statue itself, which now could be viewed sitting in a niche in the middle of the far, long side-wall of a wide, shallow room (the so-called *breitraum* cella). From this period on, the direct-axis ground plan and *breitraum* cella remained the standard for Babylonian temples. In Assyria, however, some elements of the bent-axis approach were retained in the rectangular *langraum* cella, which one entered through a door on one of the long sides, then turning 90 degrees to face the cult statue on a dais at the narrow end of the room.

Also, from the end of the 3d millennium B.C.E. on, the staged towers known as ziggurats became an essential feature of Mesopotamian temple complexes in both Babylonia and Assyria. The earliest ziggurats in Babylonia probably date to the mid-3d millennium B.C.E. (the ED period); indeed, the origins of these towers are almost certainly to be linked to the temple platforms of preliterate times. The intended function of these multi-staged towers (a ziggurat might have as few as three or as many as seven stages) remains uncertain, although of several hypotheses that have been advanced to explain their purpose (Were they thrones of the gods—cosmic mountains that served as tombs of a dying/resurgent god?), the hypothesis that identifies them as stairways connecting heaven and earth, thereby allowing the deity to descend from heaven, has become widely accepted. Normally, a "high" temple stood atop the ziggurat, a "low" temple near (not necessarily adjoining) its base.

Indisputably the best preserved ziggurat is that built for the moon god Nanna-Su'en at Ur by Ur-Nammu and his successor, Shulgi, who ruled over Sumer and Akkad during the early 21st century B.C.E. (this structure quite likely conceals within it, however, an earlier ziggurat dating to ED times). This structure originally had three stages, atop the highest of which presumably stood a "high" temple or shrine (the structure itself has not survived). The tower was constructed of a solid mudbrick core that was faced with a 2.4-meter-thick layer of baked brick set in bitumen. The lowest stage measured about 61 by 46 meters and was about 15 meters high; a triple stairway converged at its top. With the construction of this ziggurat was ushered in, moreover, yet another new concept in Mesopotamian religious architecture: a walled precinct enclosing a large, open space, with a monumental structure set in the middle and with one or more planned courtyards within the precinct. Also within the walls were a storehouse and two official residences, as well as a temple kitchen where, presumably, the gods' meals were prepared (see Oates 1979: 46–47; Lloyd 1978: 151–52). Other well-known ziggurats in Babylonia include a well-preserved Kassite-period (mid-2d millennium B.C.E.) example at ancient Dur-Kurigalzu (modern Aqar Quf, W of Baghdad) and, of course, the Etemenanki ("the house that is the foundation of heaven and earth"), the mighty ziggurat that stood within the temple precinct of the great god Marduk at Babylon during the 6th

century B.C.E. It is this structure that possibly inspired the Tower of Babel story in the OT book of Genesis. Although the structure itself has long since been demolished by the depredations of brick scavengers, the awe that it once must have inspired can easily be sensed in the famous (albeit rather skeptical) description of it by the 5th-century B.C.E. Greek historian Herodotus (*The Histories*, Book I).

The ziggurat came to be a characteristic feature of religious architecture in Assyria as well by the early 2d millennium B.C.E. Three (including a twin-ziggurat complex) were discovered at the traditional capital of Assyria, Ashur, the earliest of them having been built by the late 19th-century B.C.E. ruler Shamshi-Adad. Later ziggurats were built at Nimrud (ancient Kalhu) and Khorsabad (ancient Dur-Sharrukin). The physical relationship of tower to sanctuary in Assyria tended to differ, sometimes quite markedly, from that in Babylonia. In particular, in some instances in Assyria the god's sanctuary extended into the core of the tower itself, so that the niche containing the god's statue was actually situated within the tower's base. No similar configuration is known from Babylonia.

C. Social Role of the Temple

Throughout antiquity, no institution played a more significant or enduring role in ancient Mesopotamian society than the temples of the great urban centers of Babylonia and Assyria.

E. Sollberger (1975: 34) has succinctly defined the Babylonian temple as "the house in which a god lives, manages his worldly business, is served by his household and by his people, and, through his own success, ensures the happiness and prosperity of his city and her inhabitants." This definition incorporates very well the two principal translations of the Sumerian and Akkadian words for "temple" (respectively, É and *bītum*): "house" and "household." Quite simply, the essential function of an ancient Mesopotamian temple was to serve as the house of the city's patron god or goddess. Yet the identity of the patron deity with his or her temple was so complete that the temple can be regarded, not simply as the god's abode, but as the god's "embodiment" (Jacobsen 1976: 16–17). Looming high above the city's skyline, dominating the horizon, the temple provided the inhabitants of a Mesopotamian city "visible assurance that the god was present among them" (Jacobsen 1961: 276). Furthermore, as the city's patron and protector, the deity was fittingly regarded as its true landlord. It is hardly surprising, then, that, from the advent of written records, the temple households appear as the owners and administrators of vast estates, often comprising thousands of acres, as well as enormous herds of livestock and various storehouses, granaries, and workshops where the produce of the temple estates was sheltered and processed. Just as the temple dominated the city architecturally, then, the temple's household dominated—or, at the very least, played a vital role in—the city's economic life.

Because of the patron deity's central role in the life of the city, and from the great wealth produced by his/her estates, there accrued to the temple a number of significant social roles within the surrounding community. Perhaps most important, its fields and orchards produced surpluses of barley and wheat, dates, and other foodstuffs that might sustain the community in hard times. From that same produce came the funds to supply wages and rations to, in some instances, thousands of full-time and part-time employees and dependants whose status might range from chief temple administrator (Sum SANGA) or palace official to semi-free textile worker or agricultural laborer. The temple also protected the economically disadvantaged by sheltering and employing widows, orphans, and war captives; by standardizing weights, measures, and interest rates; or even by granting small interest-free loans of grain (although, in other circumstances, temple administrators might exact interest rates as high as one-third of a loan's principal). On a more ostensibly "cultic" level (and it is prudent, in discussing the social role of the Mesopotamian temple, not to insist on too strict a separation of "cultic" from "economic" or, for that matter, "spiritual" from "secular"), the temple might perform services such as administering oaths and ordeals in judicial proceedings.

Few scholars would dispute, however, that, in the minds of ancient Mesopotamians themselves, the temple's most crucial function was to provide for the city's patron deity a secure, permanent residence of appropriate spaciousness and luxury. Here, the deity's servants could attend to his or her "care and feeding" (Oppenheim 1977: 183) by bathing and clothing the deity's statue in its private chambers and by preparing and ceremonially presenting regular food offerings according to a suitably elaborate, long-

established ritual. In the unstinting performance of these duties lay the community's only hope, if not assurance, for its continued safety and prosperity.

SYRIA-PALESTINE

There is no technical word in the Hebrew Bible for *temple* or *sanctuary.* Hebrew *bêt,* "house," is regularly used in connection with the name of a particular deity, such as the "House of Yahweh" for the Solomonic temple, the "House of Dagon" at Ashdod, etc. Similarly the Hebrew *bāmāh* means "high place," but clearly denotes a shrine or sanctuary, usually Canaanite, yet it also refers to the royal sanctuary at Dan in N Israel. Beyond that, Hebrew *miqdaš* "shrine" (literally "place set apart") is sometimes used to describe a holy place, but the distinction, if any, is not clear. Occasionally, the terms are grouped together in ways that seem confusing, as "houses of the high places" (1 Kgs 13:32), or "shrines of the high places," (2 Kgs 17:29, 32; 23:19). A partial solution to the ambiguities inherent in the biblical terminology may lie in the fact that for the final redactors of the Hebrew Bible (i.e., the Deuteronomic historians) there *was* only one temple-sanctuary—that in Jerusalem. However, the Bible's lack of familiarity with other cultic installations is rectified in part by the discoveries of modern archaeology, which have brought to light a number of Canaanite, Philistine, Israelite, and other temples and sanctuaries. This review will summarize the main such installations known from the Chalcolithic, Bronze, and Iron Ages (for details, see entries on individual sites; and see also TEMPLE, JERUSALEM).

A. Chalcolithic (ca. 4500–3400 B.C.)

The earliest real temple in Palestine, in the sense of being a monumental public structure dedicated exclusively to cult practice, is the splendid hilltop structure above the spring at En-gedi which overlooks the Dead Sea. See Fig. TEM.05. It is a large *Breithaus* (broadroom) building, surrounded by a temenos wall with a gatehouse. Many scholars believe that the fabulous hoard of copper and ivory cultic implements, found hidden in a cave in the Naḥal Mishmar nearby, was part of the original paraphernalia of this temple. A smaller temple, perhaps a household shrine, was found at Tuleilat al-Ghassul at the N

end of the Dead Sea, with a bichrome wall painting depicting elaborate geometric motifs, priests' masks, and the like. Other small sanctuaries, such as the one at Gilat, have produced zoomorphic and anthropomorphic terra-cotta figurines; and on the Golan Heights, household shrines are characterized by small basalt altars with both human and animal motifs.

B. The Early Bronze Age (ca. 3400–2000 B.C.)

The first great urban era in Palestine understandably exhibits more monumental temples. Belonging to EB II are several *Breithaus* temples, based simply upon larger versions of the typical broadroom domestic dwelling. The Megiddo XIX temple, built just above bedrock, is typical—a single-room building with centrally aligned column bases. At ʿAi, two temples are known: the "sanctuary" adjacent to the city wall, with several phases belonging to EB I–II; and the so-called "Palace" on the summit, an Egyptian-style structure converted in EB III to a massive temple with splendid masonry construction, probably the finest 3d millennium structure in Palestine. Also belonging to EB III is the "White Building" at Tel Yarmut C.V–IV, again a fine masonry structure somewhat more rectangular than most, with thick plastered walls, column bases, and a low podium on one wall. The Arad EB II "Twin Temple" of strata III–II is unique only because of its plan that features two *Breithaus* structures side-by-side; an outer, partially walled courtyard has a stone altar and an adjacent stone-lined sunken *favissa.* See Fig. TEM.06. Smaller EB II–III sanctuaries, more like shrines, are those at Jericho and at Bâb edh-Dhrâ. No EB IV temples or sanctuaries are presently known, this being a final, post-urban phase. All the above temples and sanctuaries were looted in antiquity and thus have yielded few if any artifacts, the Egyptian alabaster vessels from ʿAi being a notable exception. The buildings themselves are simple, one-room structures, with no particular orientation, and only occasionally an altar as an item of furnishing.

C. The Middle Bronze Age (ca. 2000–1500 B.C.)

The urban revival of the first half of the 2d millennium B.C., has produced a larger number of temples and sanctuaries representing several prototypes. Nearly identical single-room *migdal* or "fortress" temples are known from the MB III phases at Megiddo (str. X) and Shechem ("Fortress Temple 1"); and a similar, less massive such temple is known from area A at Hazor (the str. XVI "Long Temple"). Hazor area H (str. XVI; MB III) has also yielded the earliest bipartite temple in Palestine. Finally, an MB III tripartite temple at Shechem ("Temple 7300") was built into a palace adjoining the city wall and NW gate. See Fig. TEM.07. More recently, very small single-room temples have been found at Tel Kittan and Kfar Ruppin; and the tiny village of Tell el-Hayyat in the Jordan Valley has produced a series of five such superimposed temples, dating from MB I–III, with terra-cotta and bronze votive offerings. The bipartite and tripartite versions of these longroom temples continue into the LB and Iron Ages.

The Nahariyah MB I–III temple is a broadroom structure with several phases, featuring a large outdoor circular altar or "high place." Isolated from any known settlement, it is located on the seashore, probably dedicated to Asherah, whose name at Ugarit means "She who treads the sea." This identification is strengthened by the discovery of several terra-cotta and metal Mother Goddess figurines, as well as a mold for casting them. Another unique MB III cultic installation is the famous Gezer "High Place," an outdoor shrine that features ten enormous standing stones in a N–S alignment with a large stone basin or laver adjacent to them, all of which are surrounded by a plastered pavement with a large stone basin or laver. Quantities of burned sheep and goat remains indicate that animal sacrifices were offered there, but it is more likely a covenant-renewal site than a mortuary installation, as formerly thought.

Most of the MB temples and sanctuaries were looted in antiquity, or were rebuilt in later times and thus had their original features altered beyond recognition.

D. The Late Bronze Age (ca. 1500–1200 B.C.)

The last phase of the Canaanite Bronze Age witnessed the proliferation of earlier style temples, as well as the introduction of newer, local and Egyptian style temples. The Megiddo and Shechem *migdal* temples were rebuilt (str. VIII–VII and "Fortress Temple 2a" respectively). The Hazor area H temple was rebuilt as another bipartite building (str. XV) and it was probably in this phase that the Syrian style basalt orthostats were added all along the lower walls. In the outer court were stone offering tables and basins, as well as a potter's workshop with many small, votive bowls. In its reuse in LB II (str. XIV), this building

was expanded into a tripartite temple with the orthostats reused. The temple continued in use in the following stratum (XIII) until its final destruction and in its debris were Cypro-Minoan style stone vases, as well as a wide variety of ceramic votive vessels. Smaller examples of this basic Canaanite style temple were also found at Tel Kittan (Temple III).

Variants on the single-room local style of temple, often with offering benches around the side walls and an altar on the back wall, are well-illustrated in the series of three successive temples at Lachish, "Fosse Temples" I–III. These temples tend to have a side room, as well as pits or *favissae* surrounding them. The Lachish pits produced a rich series of ceramic votive vessels, including the well-known Lachish ewer (Hestrin 1985), whose inscription in Proto-Canaanite mentions a sheep offering for Elat. More recently, a "Summit Temple" on the upper city has been found, much more monumental in character, which yielded among other items a splendid gold relief depiction at a nude Asherah-Qudshu goddess astride a warhorse. The Tel Mevorakh (str. XVI–VIII) temple is another example of the local style, also exhibiting a rich collection of votives: ceramic and bronze vessels, jewelry, cylinder seals, and other items.

The series of temples at Beth-shan seems to be more Egyptianizing in style. Although designated by the excavators "Thutmoses III," "Pre-Amenhotep," and "Amenhotep III," the connections and dates are fanciful. All three temples are relatively elaborate mudbrick structures with offset entrances; although badly dug and published, it is clear that rich votives were associated with these temples.

In addition to these more standard temples, a number of other types of cultic installations existed in theLB. An example of a curious rectangular "maze-like" shrine with a central column or altar is known in area F at Hazor; similar to this are the isolated, off-site examples of the Mt. Gerizim (Shechem) and Amman Airport temples, the latter with rich collections of votives and (apparently) burned human bones.

A unique "Stelae Temple" at Hazor (area C) had a semi-circular alignment of 10 small basalt stela accompanied by a seated basalt figure with outstretched arms. Nearby were found a terra-cotta mask, several fine cylinder seals, a bas-relief silver plaque, and evidence of a potter's workshop. Finally, smaller shrines are known are Shiloh, including several votive vessels; and, from the final phase of LB II, the "Sanctuary" at Deir ʿAllā in the Jordan Valley.

The only actual Egyptian temple thus far discovered in Palestine in this period is the small structure located just at the base of "Solomon's Pillars" in the Wadi Timna, just N of Eilat. It evidently served an Egyptian garrison stationed there to oversee copper mining operations, and has yielded hundreds of items, many of them Egyptian.

Despite an almost bewildering variety and number of LB temples (multiple contemporary examples of some sites), there is apparently a homogeneity of cult practice reflected. This is no doubt typical of fully developed Canaanite religion, as is best documented by the Ugaritic texts. There is a multiplicity of male and female deities, most of them connected with the fertility cults of Greater Canaan. The principal offerings in these "houses of the gods" were apparently gifts of food and drink (including animal sacrifices), and various votives—common objects (such as pottery) and more costly items.

E. The Iron I Period (ca. 1200–900 B.C.)

With the end of the Bronze Age and the beginning of the Iron Age in Palestine, evidence of a multi-ethnic society appears which is no doubt reflected in cult and temple installations, as well as in other aspects of material culture.

Among temples continuing in the Canaanite LB style are the Beth-shan VI ("Seti I") temple, and probably also the small Tell Abu-Hawam IVa temple. The final phase of the Shechem *migdal* Temple ("Fortress Temple" 2b) also belongs to the early 12th century B.C. (str. XI), although many would regard this as an Israelite reuse of the old sanctuary (i.e., the "house of El-berith" of Judg 9:46). See Fig. TEM.08.

Several Philistine temples have recently come to light, the most elaborate and well-preserved being that at Tell Qasile, at the mouth of the Yarkon River, with several 12th–11th century B.C. phases (str. XII–X). The temple features an outer courtyard, an inner cella with benches and an altar, and a *favissa* that produced dozens of discarded cult objects. Many of the latter have Cypriot and Aegean connections, underlining the relations of the Philistines with the "Sea Peoples." A smaller shrine at nearby Jaffa

yielded the skull of a lion, perhaps to be identified with Asherah, the "Lion Lady." More recently, a small shrine at Tel Miqne (biblical Ekron) has come to light, with inscribed bovine scapulae similar to those found in 12th century B.C. temples at Enkomi and Kition in Cyprus.

No early Iron I temples constructed *de novo* as "Israelite" have yet come to light, but several possible Israelite shrines are now known. At Hazor, a stratum XI "squatter occupation" above the ruins of the destroyed LB Canaanite city yielded a small shrine, with several incense stands and a jar that contained a group of bronzes, probably votives, including a fine seated male deity of familiar LB type. A bronze bull figurine, also of Canaanite style, is the principal find at an isolated 12th century B.C. hilltop shrine found recently near Dothan, in the tribal territory of Manasseh (Mazar 1982). Finally, a large early Iron I altar-like construction atop Mt. Ebal, flanking the Shechem pass, has been interpreted as an Israelite shrine (cf. Josh 8:30, 31). Storejars with burned animal bones are reported, but the possibility remains that the whole installation is either domestic, or simply a watchtower.

By the 10th century B.C., however, a number of clearly Israelite cultic installations appear. A small courtyard shrine of str. VA/IVB at Megiddo includes offering stands and a limestone "horned" altar. At nearby Taanach (str. IIB), a larger shrine features an oil-pressing installation, a collection of astragali, a mold for making "Astarte" plaques, and in particular two large terra-cotta stands with a fantastic array of sun discs, sacred trees, cherubs, lions, and other familiar Canaanite iconographic motifs. Tell el-Far‘ah N. (str. VIIb; Israelite Tirzah) produced a "gate shrine" near the city entrance with a large stela and possibly another oil-press; and from another location came a *naos* or temple model, which at one time undoubtedly contained a representation of a male or female deity (elsewhere usually Asherah-Tanit). The monumental shrine at Dan may date to the late 10th, or more likely the 9th century B.C. It features a massive ashlar masonry podium approached by a flight of steps, possibly a Canaanite-style *bāmāh* or "high place" (cf. 1 Kgs 12:31). Nearby was a small long-room temple with rich cultic finds, probably a later addition. In the S kingdom was "cult Room 49" at Lachish (str. V, 10th–9th century B.C.), a small room with benches that yielded incense stands, "horned" altars, and ceramic votive vessels. Finally, the temple at Arad, with its several phases (str. XI–VIII) may have originated in the late 10th century B.C. See Fig. ARA.02.

In Iron II, the period of the divided monarchy, some of the above cultic installations continued, in particular those at Dan and Arad. The Dan temple featured an altar associated with burned animal bones and several bronze shovels; and nearby were found "horned" altars, both male and female figurines, and other cultic paraphernalia. The Arad temple, built roughly along the lines of the Solomonic temple, with an outer courtyard and altar, a central room, and a small inner chamber with a stela and two stone incense altars, was rebuilt well into the 7th century B.C. Among the finds of the later phases were a bronze crouching lion, and two shallow offering bowls inscribed *q–k*, probably an abbreviation for "set apart for the priests." At Beer-sheba, in stratum IV, another temple of the 8th–7th centuries B.C. has been reconstructed, albeit largely from negative evidence. A radically altered building in the center of the mound was interpreted by Aharoni as a demolished temple, which he believed had once featured the large "horned" altar the stones of which were found in rubble construction of a later building. A krater from this area bore the inscription *qôdeš,* "sacred." The most astonishing Israelite shrine ever found is at Kuntillet Ajrûd in the E Sinai desert. This 8th-century-B.C. structure is built into the entrance of the fortress, with low plastered benches and storerooms on each side, and plastered walls that produced several fragmentary and intact Hebrew dedicatory and blessing inscriptions, invoking El, Yahweh, and Ba‘al. Inside the fortress, large storejars featured scenes of Bes, sacred trees, lions, processions, and especially a half-nude female seated in a throne, near an inscription mentioning blessings "by Yahweh of Samaria and his asherah."

Finally, E of Beer-sheba at the site of Qitmit an apparently cultic site from the late Iron Age has been discovered which seems to be non-Israelite. The excavator suggests from the nature of the finds that it was probably Edomite. Several small rooms with benches and altars were found, in connection with a number of unique terra-cotta figurines of worshipers and deities, including a three-horned goddess.

GRECO-ROMAN TEMPLES

A. Greek Temples

Shifts in Greek religious practice in the early 1st millennium B.C.E. are reflected in the archaeological record. During the Mycenaean period sacred space had been integrated into domestic space, and religious activity had been organized around the palace of the king. After the decline of the palace system, the developing Greek *polis* segregated religious activity and began to divide sacred space from areas of habitation. One of the Greek words for sanctuary was *temenos,* meaning "an area cut off." A *temenos* was a piece of land marked off by a wall or boundary stones, reserved for sacrifices and dedications to a god. A *temenos* could be located in the center of the city, at the edge of town, or in the countryside. Caves, groves, and areas around springs or streams were often set aside for a god. A *temenos* usually contained at least an altar, but need not have contained a building.

By the 8th century B.C.E. the Greeks had begun to build temples to their gods. The typical Archaic *temenos* was an enclosed area containing a rectangular building facing a high, raised, rectangular altar *(bomos).* The Greek temple, *naos,* was considered the dwelling place of the divinity, and the main chamber of the *naos,* the *cella,* was used for the display of the cult statue of the god. Sometimes temples also included a separate chamber, *adyton,* whose use was restricted to priests or priestesses. The major religious ceremonies, however, did not take place in the temple, but at the altar outside. By the 8th century there were temple buildings at the pan-Hellenic sites of Olympia, Delphi, and Delos, and early in the 7th century there were buildings for local cults at Argos, Sparta, and Samos.

With the evolution of the Greek *polis,* public cult became more complex; sanctuaries were expanded and adorned by cities competing to display their growing wealth. Marble was introduced as a building material at Delphia in the 6th century B.C.E. and had become standard by the middle of the 5th century at Olympia and Athens.

The architecture of the Greek sanctuary was determined by the needs of the cult. Because the area of the sanctuary was thought to be sacred, certain standards of purity were required of worshippers. Inscriptions at the entrance to sanctuaries often prohibited from entry those who had recently participated in a funeral, assisted at a childbirth, or engaged in recent sexual intercourse. Basins of water were placed at the entrance of the sanctuary so that those about to worship could perform a ritual purification by sprinkling water before entering the sacred area. Because formal sacrifice was followed by public banquets, many sanctuaries had kitchens and dining rooms to serve officials and visiting worshippers. Votive dedications required places for storage, and many sanctuaries included special buildings for the display and storage of votive gifts. Wealthy cities made it a point to advertise their success by dedicating spoils from war in the great pan-Hellenic sanctuaries like Delphi and Olympia, and city treasuries were a regular feature of these public sites.

Greek sanctuaries served a variety of needs. Usually the important gods of the city were worshipped in the center of town. At Athens, Athena, as protector of the city, had her temples on the acropolis. Other temples and shrines were located in the *agora,* or commercial and political center of the city. Demeter, as goddess of agriculture, however, often had her sanctuary outside the city walls. Grand temples for Dionysos were rare; in some Greek cities Dionysos had a small temple near the theater.

Special facilities for festivals and ritual were incorporated into Greek sanctuaries. Athletic contests were part of the festivals at Nemea, Olympia, Delphi, and Isthmia; at these sites grand stadiums were located adjacent to the sacred area, near the temple and altar of the god. Incubation, or sleeping overnight in the sanctuary, was a requirement in healing cults of Asklepios; his sanctuaries at Epidauros and Corinth were therefore equipped with special stoas for the entertainment and relaxation of visitors seeking to be cured. Oracular gods often had their sanctuaries near a natural source of water. At Delphi, in the early period, water from the spring Kassotis, located in the center of the *temenos,* flowed into the *adyton* of the temple of Apollo where the Pythia gave prophetic pronouncements.

Sanctuaries for the mysteries differed from other types of Greek sanctuaries. Because mysteries were secret ceremonies, the rituals were sometimes performed inside the temple. The Telesterion of Demeter at Eleusis, for instance, was a large, square building with a roof supported by interior columns. Tiered stone steps around the inner side of the outer walls could accommodate hundreds of worshippers standing in rows at the annual celebration of the mysteries. At Samothrace the sanctuary of the Theoi Megaloi had two buildings for the two separate stages of initiation, *myesis* and *epopteia.* Both buildings had seats for spectators at the ceremonies.

Greek sanctuaries became more complex and elaborate during the Hellenistic period, enriched and decorated by the donations of the great Hellenistic kings and wealthy private individuals. Grand stoas at Delos and Samothrace accommodated increased numbers of visitors to the annual festivals. The growing popularity of the cult of Asklepios in this period is reflected in the development of great sanctuaries in his honor throughout the Aegean and Asia Minor. Greek sanctuaries continued to flourish during the Roman period, often patronized and adorned by important Roman rulers and political leaders.

B. Roman Temples

The Latin word *templum* is related to the Greek word *temenos* and referred originally to an open space marked off for observation of the sky and the taking of auspices and divination. Eventually the word *templum* referred to the piece of land dedicated to a god and used for religious ritual. A *templum* could include a building, *aedes,* an altar, and votive dedications. The *aedes* functioned like the Greek *naos* and housed the statue of the god. The architecture of Roman temple buildings, in fact was influenced by Greek models. Some temples were open to all, others were subject to restrictions based on gender or social status. Some temples belonged to private religious associations or *collegia;* many of these included cooking and dining facilities for the banquets of the members.

Roman temples served many functions and were closely tied to the needs of the state. They provided a place for the performance of public sacrifices and for the official taking of the auspices, for storing treasures, holding meetings of the Senate and other official bodies, for trials of the law courts, and for private rituals and dedications. The Roman *consuls* had their offices in the temple of Castor and Pollux.

During the period of the Republic the building of new public temples in Rome was controlled by the Senate and the tribunes. The oldest public buildings were built in the Forum and on the Capitoline hill; later temples were scattered throughout the city as it expanded and grew. Vitruvius says that temples were located in areas appropriate to the function of the gods being worshipped (1.7.1–2). New temples could be built to honor victories in war, to accommodate a new divinity introduced at Rome (e.g., Cybele, the Syrian gods, the Egyptian gods, and Mithras), or in the Imperial period, to honor the emperor. Location of new temples seems sometimes to have been determined by political requirements. During the reign of Augustus, as part of his program of religious reform, many older temples were restored and new ones built. The reign of Hadrian was the second great period of temple building and restoration, both at Rome and throughout the empire.

TEMPTATION OF JESUS. Within the NT a narrative account of the temptation of Jesus is given in all three Synoptic Gospels (Matt 4:1–11; Mark 1:12–13; Luke 4:1–13). Reference is made to Jesus' temptation in the letter to the Hebrews (Heb 2:18; 4:15), but it is otherwise passed over in silence by the NT literature.

In each of the Synoptics, the temptation narrative is an integral part of the introduction to the Gospels' story about Jesus' ministry. The three accounts agree among themselves as to the place of the temptation ("the wilderness," Gk *erēmon*), the role of the Spirit in leading Jesus to this place, and a 40-day duration of time, but they otherwise differ among themselves as to the details of the narrative. The three accounts even identify the tempter in different fashions: "the tempter" *(ho peirazōn)* in Matt; "the Satan" *(ho Satan)* in Mark; and "the devil" *(ho diabolos)* in Luke.

A. The Synoptic Problem

Discussion as to the literary relationship among the three accounts is an integral part of the Synoptic problem. Proponents of the two-source theory generally hold that the Markan account enjoys literary priority vis-à-vis the other accounts, that Matthew's account largely stems from the Q source, and that Luke's account is a conflation of Markan and Q material. Other scholars would take issue with each of these three positions. Wilhelm Wilkens (1982), for example, has argued that the Matthean account is a creation of Matthew, who was then followed by Luke.

Scholars who admit the dependence of the Matthean and Lukan accounts upon Q disagree as to whether Matthew or Luke more faithfully reproduces the Q sequence of three temptations. The majority believe that the Matthean order (bread-temple-kingdoms) better reflects Q than does the Lukan order (bread-kingdoms-temple). That Matthew's order is more logical, leading to the issue of sovereignty as its climax (Matt 4:8–10), and that he juxtaposes the two similarly structured temptations (bread-temple) are among the principal reasons in favor of the Matthean sequence. On the other hand it is noted that Luke's sequence has a topographical schema and brings the series of temptations to their conclusion in Jerusalem, features of the narrative which are consistent with Lukan interests and his redactional techniques.

B. Mark 1:12–13

The relatively simple Markan account (Mark 1:12–13) bears the imprint of Mark's editorial work and is characterized by its christological context. In it, the Spirit of God appears as an overpowering force who drives Jesus into the wilderness, the place of temptation. Mention of the Spirit highlights the action of God (Jesus himself is not named in Mark's account) and links the temptation to the account of Jesus' baptism (1:9–11). Jesus is God's agent in the confrontation with Satan.

Mark's account is devoid of specific mention of fasting, which some infer from the final mention of angels who "minister" (*diakoneō,* a word whose primary meaning is "to serve at table"). Also, Mark does not identify any specific temptations. Rather, Jesus is described as being tempted during a period of "forty days and forty nights," a span of time during which he is in the presence of wild beasts. These traits have led some scholars to see an allusion to Moses (Exod 24:18; 34:28) and/or the Exodus (Exod 16:35; Num 14:33–34; Deut 8:2; Acts 7:42) or, alternatively, to an Adam christology and/or a paradise motif (Gen 2:19; see Mahnke 1978: 28–38). Since the account forms an integral part of Mark's initial portrayal of Jesus, and "40" is a stylized number, some scholars take the account as a symbol of the struggle with Satan and the forces of evil which is characteristic of Jesus' entire ministry.

C. Matthew 4:1–11

In Matthew's account, the temptation comes after a 40-day fast from food. An infinitive of purpose (*peirasthēnai,* "to be tempted," 4:1) emphasizes that the temptation is part of the divine plan for Jesus. A conditional clause ("if [= "since"] you are the Son of God," 4:3, 6) links the temptations to Jesus' baptism (3:13–17). The *three* temptations form a single unit. Their form is that of a rabbinic scriptural disputation: various passages of the Scriptures are passed in review. The substance of the debate ultimately focuses on the meaning of Jesus' sonship.

In their original context, the three scriptural passages cited by Jesus (Deut 8:3; 6:13; 6:16) referred to the trials of Israel during the Exodus and are presented according to the sequence of these trials according to the book of Exodus. Thus, Matthew seems to present a contrast between the faithful response of Jesus as Son and the infidelity of Israel as Son (cf. Hos 2:11 in Matt 2:15). By respectively refusing the role of the wonder-worker, tempting God, and the assumption of political power, Jesus is presented as faithful to God's word and faithfully responsive to his baptismal call. Each of the temptation episodes probably reflects Jewish-Christian debate within Matthew's community and discussions between Jews and Christians relating to the role of Jesus.

D. Luke 4:1–13

The Lukan sequence of the three temptations represents a more natural geographic movement, from the wilderness to the temple. The final episode is set in Jerusalem, a center of Lukan interest. The three temptations are bracketed by the "Son of God" motif (4:3, 9), which links the temptation narrative not only to the baptismal scene (3:21–22) but also with the genealogy (3:23–28). The temptations highlight the true identity and function of Jesus.

For Luke, the 40-day period is one of temptation and of fasting. Luke's redactional interests are apparent in his reworking of the Markan material. The additional reference to the Spirit (4:1) is in keeping with an emphasis throughout Luke–Acts. The fasting sets the scene for the first of the three specific temptations. The devil's departure "until an opportune time" (Luke 4:13) may anticipate the role of Satan in the Passion (Luke 22:3) and may suggest that the period of Jesus' earthly ministry was free from Satan (Conzelmann 1960: 28).

RAYMOND F. COLLINS

TEN COMMANDMENTS. The Ten Commandments are a collection of biblical laws contained in Exod 20:1–17 and Deut 5:6–21. The title originates from Exod 34:8 (cf. Deut 4:13; 10:4), where it is stated that Moses "wrote upon the tables the words of the covenant, the ten commandments." In the Hebrew and Greek texts, the "ten commandments" are, literally, the "ten words." Although "ten" has achieved a firm place in the tradition as the distinctive characteristic of the collection, the terminology itself was apparently a secondary description of the collection. From the Greek *deka logoi* ("ten words") derives the term "decalogue" as an equivalent designation for this set of biblical laws. However, the exact enumeration of the Ten Commandments is not obvious, as later ecclesiastical usage clearly shows. Moreover, there are also obvious differences between the biblical text as to the wording of the individual commandments.

———

A. Survey of Scholarship

Some scholars find in this terminology, "the ten words," an argument in support of the view that the original form of the Ten Commandments consisted of a negative particle and a verb, each commandment thus presumed to have been expressed as a single word. Their argument is otherwise based on a distinction among biblical laws originally developed by A. Alt (1966) in 1934. Alt distinguished between casuistic law, characterized by a conditional style ("if …, then …"), and apodictic law, a simple prescription or proscription without specific mention of a corresponding sanction. He considered that the biblical tradition had taken over much of its casuistic law from the Canaanite culture, but that apodictic law was indigenous to Israel and represented true Israelite law.

1. History of the Decalogue. The Bible places the origin of the Ten Commandments within the time of Moses. According to Exodus, God gave the commandments to the Israelites when they were encamped on Mount Sinai after the Exodus from Egypt. Deuteronomy expresses the view that the covenant established on Horeb-Sinai is based on the revelation of the Ten Commandments. The biblical tradition stresses the divine origin, the completeness of the collection, and its finality (Deut 5:22). Unlike other collections of biblical laws where the role of Moses as a mediator is stressed (cf. Exodus 19; Exod 20:22; 34:32; Lev 17:1; Deut 6:1), the Ten Commandments are attributed directly to God (Exod 20:1). In Exodus 20, the first person is used in vv 2, 3, 5, 6 (cf. Deut 5:6, 7, 9, 10).

Contemporary critical scholarship is reluctant to ascribe the Ten Commandments, in their present form, to the Mosaic era. There is a wide consensus that the present form of the Ten Commandments is the result of a long historical development, whose individual steps cannot be identified with certainty. The complex process of development was related to the institutional life of Israel, its sense of identity, its social structures, its teaching, and its worship. Given the complexity of the process, it is virtually impossible to reconstruct any original form of the decalogue. Some scholars have, however, attempted to reconstitute a presumed original form of the collection.

The individual commandments have their own history. During a period of oral transmission various commandments were expanded by the addition of motivating factors, theological reflections, promises, and explanatory detail. At some stages in the transmission, the formulation of individual commandments may have been shortened.

According to some scholars, primitive collections preceded the tenfold collection (see Nielsen 1968; Gerstenberger 1965; Hossfeld 1982; Lang 1984). Even after the decalogue had come into existence as a collection of ten laws, there was still further development, as a comparison between Exodus 20 and Deuteronomy 5 clearly demonstrates. Some scholars postulate a literary dependence of one biblical text upon the other.

Each of the biblical versions of the Ten Commandments is postexilic in its present form. Most scholars agree that Exod 20:1–17 interrupts the Exodus narrative (Exod 20:18 relates to the theophany at Sinai and continues Exod 19:25). Thus the present relationship of the Ten Commandments to Sinai is considered to result from relatively late redactional work upon the Exodus narrative.

2. Important Contributions. Many of the early critical studies of the decalogue took issue with the tradition of its Mosaic origins on the basis of a history-of-religions approach to the content of the Ten Commandments. It was argued, for example, that the social ethic expressed in the decalogue is under the influence of the 8th-century prophets (Amos, Hosea, Isaiah, Micah) and that the First Commandment was unthinkable before Hosea. The Mosaic origins of the Ten Commandments were therefore questioned on the basis of a developmental theory with regard to Israel's religion and ethics. In his 1982 monograph, F. L. Hossfeld argued that the social prohibitions of Deut 5:16–21 were freely composed along the lines of Hos 4:2 and Jer 7:9. More specifically, in a 1985 essay, Christoph Levin pointed to Jer 7:9 as the source of the decalogue.

Many scholars were convinced that the religious and social ethos expressed in the decalogue was similar to that expressed in the so-called Elohist document (8th cent.). Consequently, the decalogue was frequently interpreted according to the canons of source-critical and pentateuchal documentary theory. André Lemaire (1981) distinguished four literary redactions of the decalogue: an Elohistic (from the time of Amos and Hosea), a Yahwistic (from the time of Hezekiah), a Deuteronomistic (found in Deuteronomy 5), and a Priestly redaction (responsible for the expansion of the Sabbath commandment in both Exod 20:8–11 and Deut 5:12–15).

The major thrust of most of the recent historical-critical studies of the Ten Commandments has sought to identify their literary form, their relationship with the institutional life of Israel, and the theological and literary significance of their presence in Exodus and Deuteronomy.

A significant precursor of Alt's form-critical analysis of Israelite law was the work of Sigmund Mowinckel (1927). Mowinckel held that although the present versions of the decalogue are relatively late, its origins are quite ancient and are to be associated with Israel's worship. Form-critical analysis of Psalms 15 and 24 led to their being considered entrance liturgies. Similarly, the decalogue was judged to have originated in a liturgical rite. Mowinckel postulated the existence of an annual New Year's covenant renewal ceremony in which the Law was proclaimed, the decalogue serving as the focal point of the proclamation of the Law. Mowinckel pointed to the allusions to the decalogue in Pss 50:16–20 and 81:9–10 as an indication of the cultic use of the decalogue. While recent scholars might take issue with the thesis of a cultic origin of the decalogue, most have adopted the notion that the decalogue enjoyed a cultic function in Israel's tradition.

A further step in the study of the decalogue was undertaken by G. E. Mendenhall (1954a), who compared biblical covenant texts and a group of Hittite suzerainty treaties. Among the common features which he identified were their preambles, the historical prologues, the covenant stipulations, provisions for the preservation and reading of the treaties, and the curses and blessings cited as sanctions relative to the observance of the treaties (cf. Deuteronomy 27–28). While various scholars take issue with Mendenhall's contention that the origins of the biblical covenant pattern owe specifically to the Hittite model, many agree that the decalogue, as a summary of covenant stipulations, has many formal similarities with the suzerainty pacts. A comparison highlights the importance of the preamble and the historical prologue as providing keys to understanding the decalogue in its present literary form. The suzerainty model may also provide a clue as to the significance of the tradition of the two tables (Exod 31:18; 34:29; Deut 4:13; 9:10–11, etc.). Originally each table may have contained the entirety of the decalogue. According to the model of a treaty, two copies would be made of the text, one for each of the parties to the agreement.

E. Gerstenberger's 1965 dissertation introduced a new phase in the discussion of the Ten Commandments. He successfully demonstrated that Alt's division between apodictic and casuistic law was far too simple, since the category of apodictic law was not as unified as Alt had supposed. Gerstenberger rejected the view that the decalogue had its origin in the cult and/or was based on treaty

stipulations. Rather, he argued that the more basic form of Israelite law was "the prohibitive form" whose roots lie in a clan ethic and that at most, cultic use and treaty models represent secondary developments. While one might legitimately take issue with Gerstenberger's notion of the clan ethic, he clearly demonstrated that the content of the second group of commandments is not unique to Israel and that it has much in common with other ancient expressions of family ethics.

Subsequently, Anthony Phillips (1970) argued that the Ten Commandments functioned as a summary of Israel's criminal law. Although the precepts of the decalogue are not sanctioned within the decalogue itself, the Bible elsewhere indicates sanctions, often death, for violations of precepts similar to those contained in the decalogue. According to Phillips, criminal law regulates conduct that is detrimental to the whole community. Given Israel's covenant status with Yahweh, any offense against the covenant was against the community. Therefore, the community was subject to Yahweh's wrath in the event that his covenant was violated. Through a somewhat different approach, then, Phillips underscored the covenantal nature of the extant versions of the Ten Commandments.

While these various studies illustrate the complexity of the issues involved in any attempt to understand how the present decalogue came into being, they also point to the central position of the Ten Commandments within the biblical tradition. They are presented as the direct address of God, identified as a complete entity, given a special name, are reflected in the prophets (Hos 4:1; Jer 7:9) and the psalms (Psalms 50; 81), and provide a framework for the revision of law found in Deuteronomy 12–26. This attests to their influence upon Israel's faith and ethos.

B. The Individual Commandments

In Exod 20:2 and Deut 5:6, the Ten Commandments are introduced by a preamble, which Zimmerli (1953) identified as a "self-introductory" formula. The revelation of God's name (cf. Exod 3:14; 6:2) had been linked with the promise of Israel's deliverance from Egypt. Its citation in the preamble to the decalogue is a further sign of Israel's election. That God speaks directly to his people indicates that the commandments are an integral element within the election of the nation. The commandments are a gift from God, but they also place a claim upon Israel insofar as they are an expression of God's will for his people.

1. The First Commandment. The style of the precept itself, "you shall have no other gods before me" (Exod 20:3; Deut 5:7), is terse and negative. The commandment has been expanded by an explanation and a sanction (Exod 20:5–6; Deut 5:9–10; cf. Exod 34:14; 18:10).

Various translations have been proposed for the phrase "before me" *(ʿal-pānāy),* many of them with a negative connotation ("over against me," "in opposition to me"), but the traditional rendering appears as useful as any. The commandment defines the relationship between Yahweh and Israel by categorically eliminating any other deities from Israel's allegiance. It bans the worship of foreign gods.

The exclusivity of the relationship between Yahweh and Israel is an important element in Israel's oldest religious tradition. However, it is not necessary to ascribe the present formulation of the commandment to a very early stage of the tradition, nor is it advantageous to interpret the commandment as if it inculcated monotheism. The commandment technically enjoins monolatry, but it can be understood within a henotheistic religious system.

2. The Second Commandment. The wording, "you shall not make for yourself a graven image …" (Exod 20:4; Deut 5:8), has been incorporated into the framework of the First Commandment. Originally, the commandment appears to have banned any image of the deity carved from wood or stone, but its scope was later expanded to include metal figures as well. The additional explanation ("any likeness") banned every representation of God.

Whereas virtually all other contemporary cultures used cultic representations as a means of entering into contact with the deity, Israelites were not to do so. At issue was the fact that God cannot be controlled by humans. The Israelites were forbidden even to attempt to control Yahweh. Deut 4:9–12 is a helpful attempt to interpret the ban.

3. The Third Commandment. "You shall not take the name of the Lord your God in vain …" (Exod 20:7; Deut 5:9) prohibits the abuse of the name of God, the sacred tetragrammaton. The ancients

considered the name as expressing the nature or function, almost the very being, of a person or thing. Within Israel the name of God had an important role from the earliest times. God's name was called upon (Gen 4:26) and blessed (Ps 72:19). It was not to be blasphemed (Lev 24:16) or cursed (2 Kgs 2:24).

Although this commandment may have originally enjoyed a fairly wide scope, it seems to have been primarily cited as a prohibition of false oaths or the use of God's name in a curse from a very early period. Israelites ought not to try to manipulate God by an abusive use of his name.

4. The Fourth Commandment. Among the precepts of the decalogue, "remember the Sabbath day …" (Exod 20:8–11; Deut 5:10–12) is the one which has attracted the greatest amount of scholarly interest. Questions have been raised as to its origins and the etymology of the term "Sabbath," as well as the significance of the different explanatory interpretations offered by the Exodus and Deuteronomy accounts.

Many scholars observe that the Sabbath observance is unique to Israel and that it originally had no association with cultic practices. The Sabbath observance does not owe its origins to the Fourth Commandment, since the practice is apparently very ancient, having existed in Mosaic times (cf. Exod 16:22–30). The Fourth Commandment merely recalled and reinforced the traditional observance.

The theological explanation offered in Exod 20:11 recalls the Genesis 1 account of creation, but that account itself presupposes the Sabbath observance. Deut 5:10–12 offers a different theological explanation. Hossfeld (1982) considers this formulation of the Sabbath precept as the center of the Deuteronomic redaction of the decalogue. The explanation of the commandment in Deut 5:10–12 is in keeping not only with Deuteronomy's humanitarian concerns but also with the original social purpose of the precept. Rabbinic tradition emphasized that the commandment also required six days of work (Exod 20:9; Deut 5:13).

5. The Fifth Commandment. Like all of the other commandments in the decalogue, the Fifth Commandment, "honor your father and your mother …" (Exod 20:12; Deut 5:16), was addressed to adults. It was a prescription requiring the able-bodied to provide care and support for the elderly and is to be understood within the context of the extended, rather than the nuclear, family. A variety of legal prescriptions concerning the elderly form the background of this commandment. Casuistic statements such as those found in the Book of the Covenant (e.g., Exod 21:15, 17) are similar to those found in the laws of neighboring cultures. See LAW (BIBLICAL AND ANE). The positive formulation of the commandment summarizes a whole body of legal prescriptions concerning the physical and material support of the elderly.

The promise of life, the effective opposite of a curse, pertains to all of the precepts of the decalogue. It was attached to the Fifth Commandment to emphasize this particular precept. This results in an affirmation of reciprocal justice. During the postexilic period the commandment was particularly significant because of the importance of society's seniors in passing along the traditions of the people. Various wisdom traditions (e.g., Proverbs 1–9; Sir 3:1–16) elaborate on the implications of the commandment. During the Hellenistic period the commandment was used to provide a scriptural warrant for the obedience owed by children to their parents (e.g., Philo *Dec* 165–67; Eph 6:2).

6. The Sixth Commandment. "You shall not kill" (Exod 20:13; Deut 5:17) is a commandment whose Hebrew text is difficult to translate into English. The Hebrew verb *rāṣaḥ* has a meaning more restrictive than the generic English verb "to kill."

The commandment is addressed to free, landholding Israelites and affords protection for the life of the Israelite. The commandment forbids the illegal and willful killing of the innocent, but does not ban capital punishment nor forbid the killing of Israel's enemies during war. The commandment appears also to forbid "indirect" killing. Texts such as Ps 94:6, Job 24:14, and Deut 22:26 probably refer to social situations which effectively deprived the poor, widows, orphans, and so forth of life.

7. The Seventh Commandment. "You shall not commit adultery" (Exod 20:16; Deut 5:18) is different from the Tenth Commandment and must be understood within contemporary social structures. It was pertinent to a society that was not strictly monogamous, but was clearly patriarchal: women were considered to be virtually the chattel of their husbands.

The commandment forbade male Israelites to have sexual intercourse with the wife of another Israelite, a fellow member of the covenanted community. According to Deut 22:24 and Lev 20:10 both members of an adulterous pair were to be put to death by stoning.

Israelite men were not forbidden to have sexual intercourse with the slaves of their own household. Sexual intercourse between an Israelite man, albeit married, and an unmarried or unbetrothed woman was not considered to be the crime of adultery. The seduction of an unbetrothed daughter of an Israelite was, however, considered to be an offense violating a neighbor's property rights (Exod 22:15–16). See also ADULTERY.

8. The Eighth Commandment. In the popular view, "you shall not steal" (Exod 20:15; Deut 5:19) is generally understood as forbidding robbery, the unlawful private appropriation of another's goods. In 1953, A. Alt argued from a variety of considerations, including the placement of this commandment in the decalogue and the necessity to distinguish between it and the Tenth Commandment, that the commandment forbade the kidnapping of the free Israelite—to enslave or to sell him—rather than the stealing of material possessions. That the Heb verb *gānab* frequently supposes a human object (cf. Gen 40:15) supports this view. The situation would have been common enough (cf. Genesis 37) to warrant a particular precept. Although Alt's views have been generally accepted by scholars, some scholars (Jackson 1975; Klein 1976; Crüsemann 1983; Hossfeld 1982) have rejected them and espoused the older interpretation of the commandment, which interpret it as a forbidding of robbery.

9. The Ninth Commandment. Although many English-language translations of the Ninth Commandment, "you shall not bear false witness against your neighbor," offer the same wording for both the Exodus and Deuteronomic versions of the commandment, following the LXX (Exod 20:16; Deut 5:20), different Hebrew words are to be found in the MT. Exod 20:16 reads Heb *šeqer,* "lie," while Deut 5:20 reads Heb *šāwʾ,* "meaningless, incorrect speech." The change of wording was apparently intended to tighten rather than to change the meaning of the commandment.

The commandment forbids false witness in a legal proceeding. Protection is extended not only to the Israelite but to the "neighbor," that is, the coinhabitants of the same land.

10. The Tenth Commandment. The Deuteronomic version of the commandment, "you shall not covet …" (Deut 5:21), is different from that of Exod 20:17. Rather than considering the wife among the household properties of an Israelite, Deut 5:21 separates her from among a man's other possessions. Deuteronomy also specifically forbids the illegal appropriation of a neighbor's field.

The purview of this commandment is different from that of the Seventh and Eighth Commandments. The Tenth Commandment forbids the protracted appropriation of another's wife rather than individual acts of adultery. With regard to goods, the commandment forbids not only robbery but all illegal acquisition of another's property. See WANTING AND DESIRING.

C. Later Tradition

Apart from Exodus 20 and Deuteronomy 5, the precepts of the decalogue are rarely cited in the Hebrew Bible (Hos 4:1; Jer 7:9).

1. New Testament. The NT does not give the entire list of the Ten Commandments. Nor does it refer to the Ten Commandments in a global fashion (but cf. Mark 10:19; Luke 18:20). However, the individual precepts of the decalogue are more frequently cited in the NT than they are in the OT. They are featured in the antitheses of Matthew's Sermon on the Mount (Matt 5:21–37) and highlighted in the call of the rich young man (Matt 19:16–30; Mark 10:17–31; Luke 18:18–30). A story of controversy between Jesus and the Jews confirms the traditional Jewish interpretation of the Fifth Commandment (Matt 15:1–9; Mark 7:1–13). Individual commandments are also cited in the epistolary literature (Rom 8:7–13; 13:8–10; Eph 6:1–4; Jas 2:8–13). This situation reflects a Jewish catechetical tradition and the importance of traditional Jewish Halakah in early Christian paraenesis.

2. Jewish Tradition. The Nash papyrus and the tefillin found at Qumran suggest that the commandments had a liturgical significance within Judaism. It would appear that the recitation of the decalogue was originally part of the daily temple service (*m. Tamid* 5:1).

Within Judaism the commandments are clearly divided into a group of five positive and five negative commandments. Jewish tradition stresses that the commandments were spoken by God (*b. Ber.* 12a). In Judaism the sequence of the commandments sometimes differs from that given in the Pentateuch (cf. Mark 10:19).

Although Christians have tended to make use of the Ten Commandments somewhat independently of their biblical context, the rabbinic tradition has refused to isolate the decalogue from the larger body of biblical law. This posture has been adopted to combat the idea that only the Ten Commandments of the decalogue were given by God. The precepts of the decalogue are scattered among the 613 commandments as enumerated by Maimonides. Nonetheless some Jewish sources (e.g., Philo, or *Num. Rab.* 13:15–16) have classified the 613 commandments under the ten headings of the precepts of the decalogue.

3. Christian Tradition. Christians do not generally adopt the Jewish division of the Ten Commandments into five positive and five negative commandments. Nonetheless, they differ among themselves in the enumeration of the commandments and their consequent distribution in "two tables." The Roman Catholic, Anglican, and Lutheran traditions generally consider that three commandments relate to one's relationship to God (Exod 20:3–11; Deut 5:7–15) and seven to one's neighbor (Exod 20:12–17; Deut 5:16–21), thus treating Exod 20:4–6 as a single commandment and Deut 5:21 as two commandments. The Reformed tradition divides the commandments into a group of four and a group of six, separating the First from the Second Commandment (see above) and treating Exod 5:17 (= Deut 5:21) as a single precept.

From medieval times, many Roman Catholic authors have interpreted the Ten Commandments as a summary of "natural law." In recent years Christian scholars have tended to associate the decalogue with freedom, as both a gift from God and a task for humans, and with fundamental human rights.

TEN LOST TRIBES. See LOST TRIBES, THE.

TENONS [Heb *yādôt* (יְדוֹת)]. Projections at the end of the boards *(qĕrāsîm)* that formed the two side walls and the back wall of the tabernacle. These projections, made of silver, were inserted into two sockets as described in the tabernacle texts of Exodus (Exod 26:17, 19; 36:22, 24). See also TABERNACLE.

CAROL MEYERS

TENT OF MEETING. See TABERNACLE.

TENTH PART (OF AN EPHAH). See WEIGHTS AND MEASURES.

TEPHON (PLACE) [Gk *Tephōn* (Τεφων)]. Listed in 1 Macc 9:50 as one of the cities of Judea fortified by Bacchides in his battle with Jonathan. Goldstein (*1 Maccabees* AB, 386), following Abel (1925: 206–7), argues that *Tephō,* found in Vg and supported by Lat mss as well as a number of minuscules, is the more likely reading (note also Grimm 1853: 141). This name designates the Heb *tappŭaḥ* rather than *tĕqôaʿ* (Tekoa, M.R. 170115), suggested by the text of Josephus (*Ant* 13.1.3 §15). There is, however, more than one TAPPUAH listed in Joshua. Since the other cities fortified by Bacchides are located in the hill country N of Jerusalem, the area from which the Maccabean resistance originated, "Tephon" must refer to the Tappuah listed in Josh 17:7–8 and elsewhere located on the border between the territory of Ephraim and Manasseh, presumably at the modern location of Tel Sheikh abu Zarad (M.R. 172168).

JOHN KAMPEN

TERAH (PERSON) [Heb *teraḥ* (תֶּרַח)]. Son of Nahor, and father of Abram, Nahor, and Haran. Terah lived 205 years and died in Haran after migrating with his family from Ur of the Chaldees (Gen 11:24–32). It was in Ur that Terah, with his father Nahor, worshiped other gods (Josh 24:2). The designation of Gen 11:27–25:11 as the *tôldôt* of Terah suggests the importance assigned to this figure as the father of Abram and reflects the 135 years Terah lived after Abram's birth, enough time to experience many of the events in these chapters (Wenham *Genesis 1–15* WBC, 252).

Terah's name has been studied both in terms of its etymology and in terms of its association with other geographic and personal names. In respect to the former, initial attempts to find a divine name *trḥ* in the Ugaritic myth of Keret have been rejected as without foundation (Albright 1938; Gordon 1938; Jouon 1938: 280–81). The *trḥ* root in Hebrew may mean "ibex, mountain goat." This root appears in Amorite names of the early 2d millennium B.C. (Gelb 1980: 34, 200). Also of interest is the attempted association with *Têr* the moon god in the region of Harran in the Neo-Assyrian period, whose name has been understood as present in personal names (Landsberger and Bauer 1926–27: 92; Lewy 1945–46: 425–26; Zadok 1977: 42). For the possible association of Terah and his father with the lunar cult at Ur and Haran, see NAHOR (PERSON). However, the association of the name Terah with the moon god is now doubtful, as *Ter* is a form of *Šer,* related to West Semitic *Sahr* and thus phonologically different.

Many scholars have associated "Terah" with a place name *Til ša turāḫi,* found in Neo-Assyrian texts as early as those of Shalmaneser II in the mid–9th century B.C. and situated near Harran on the Balikh river (Kraeling 1922–23; Parpola 1970: 355–56). See HARAN (PLACE). Schneider (1952: 521) observes a Sumerian personal name *te-ra* in a cuneiform text from the Ur III period (CT 10: pl. 46 no. 18964). He compares the rendering of "Terah" in the Vulgate *(thare)* and in the Septuagint *(thara),* neither of which preserve evidence of the final laryngeal.

As with other personal names in Abram's ancestry of Genesis 11, "Terah" may have associations with a place name in northern Mesopotamia (Westermann 1984: 564–65). Albright (1924: 386–87) finds in *Til ša turāḫi,* "mound of the ibex," evidence of Aramean settlements in the 2d millennium B.C.

TERQUMIYEH. See IPHTAH (PLACE).

TERROR ON EVERY SIDE [Heb *māgôr missābîb* (מָגוֹר מִסָּבִיב)]. The phrase *māgôr missābîb* occurs in Jer 6:25; 20:3, 10; 46:5; 49:29; Ps 31:14; Lam 2:22. In Jer 6:25, 46:5, and 49:29 the phrase is a metaphorical expression for an invading army and is commonly translated "terror on every side." In Lam 2:22 the phrase also refers to an invading army. The use of the phrase in Jer 20:10 and Ps 31:14—Eng 31:13—both laments—refers to enemies of the prophet and psalmist whose whispering and plots are "terror on every side" for the prophet and the psalmist.

However, the occurrence of the phrase in Jer 20:3 has by far generated the most interest and debate. Holladay (*Jeremiah 1* Hermeneia, 543) proposes that all other uses (with the possible exception of Psalm 31) are dependent upon the Jer 20:3 text. In Jer 20:3, the phrase *māgôr missābîb* is the new name Jeremiah gives to Pashhur as part of an oracle of judgment against the priest who had beaten and imprisoned the prophet.

The two most significant problems in interpreting the phrase *māgôr missābîb* in Jer 20:3 have been first, to determine the meaning of the phrase itself, and second, to understand how, if at all, the phrase might be a play on Pashhur's name.

Regarding the meaning of the phrase, the problem is made difficult by the variety of lexical possibilities for *mgwr.* These possibilities are evident in the way other ancient versions translate Jer 20:3: LXX translates *mgwr* as *metoikos* ("alien") and Syriac as *tawaba* ("foreigner"), thus associating the word with *gwr* in the sense "to sojourn." Vg uses *pavor* and seemingly associates *mgwr* with the verb *gwr* meaning "dread." However, the Targum appears to relate the word to yet another meaning of *gwr,* namely "to show enmity, attack" (McKane *Jeremiah I–XXV,* ICC, 461–62; Holladay *Jeremiah 1*Hermeneia, 543–44). While *māgôr missābîb* in Jeremiah 20 has typically been translated as "terror on every side," Holladay (p. 544) has proposed that the phrase is given multiple meanings in its context in vv 4–6: Pashhur will be a *māgôr,* i.e., a terror to his friends; Pashhur's friends will be an accuser of *māgôr,* i.e., attack by falling to the sword of the enemy; Pashhur and his cohorts will be an occasion of *māgôr,* i.e., sojourn or exile in Babylon. When *māgôr* is understood with multiple meanings, Holladay suggests (p. 544) that *missābîb* not only has spatial ("every side") but "notional" connotations; " 'from every point of view'—'*mgwr* with every nuance.' "

Regarding the relationship of *māgôr missābîb* to the name Pashhur, there have been a number of proposals which have begun by attempting to discover the meaning of the name Pashhur—often assuming an Aramaic root. McKane (pp. 462–63) succinctly summarizes these efforts. Among the most recent is that of Holladay, who suggests the Aramaic sense of Pashhur's name is "prosperity" or "fruitfulness." The new name given by Jeremiah—*māgôr missābîb*—is according to Holladay (see above) a triple negation of the positive sense of Pashhur's original name (Holladay *Jeremiah*, 544; cf. Holladay 1972: 305–20). In contrast to these efforts to relate *māgôr missābîb* to Pashhur's name, Bright does not believe there is an obvious play on Pashhur's name (*Jeremiah* AB, 132; cf. McKane, 464).

The phrase *māgôr missābîb* remains enigmatic. While "terror on every side" is the usual translation, even this sense is not certain in the key text, Jer 20:3.

JOHN M. BRACKE

TERTIUS (PERSON) [Gk *Tertios* (Τερτιος)]. The scribe to whom Paul dictated Romans in Corinth ca. 58 C.E. (Rom 16:22). To the recipients of the letter Tertius wrote: "I, Tertius, the writer [*grapsas*] of this letter, greet [*aspazomai*] you in the Lord [*en kyriǭ*]" (16:22). It is debatable whether Tertius intended *en kyriǭ* to be linked with *grapsas* or with *aspazomai.* The former, i.e. "written in the Lord," would indicate that Tertius viewed the production of this letter as part of his Christian service; the latter, "greet in the Lord," would convey the solidarity he felt in Christ with the Roman believers. The latter is the more commonly given interpretation, support for which is the implication in Tertius' greeting that he was known by some of the Romans (Cranfield *Romans* ICC, 806).

Tertius is the only one of Paul's amanuenses mentioned by name in his letters. That it was not unusual for Paul to use such services can be inferred from various statements that he wrote parts of letters in his own hand (1 Cor 16:21; Gal 6:11; cf. Col 4:18; 2 Thess 3:17).

Tertius' collaboration with Paul raises questions about the methods of dictation and shorthand used in the process and the extent to which a scribe may have left his own imprint on the thought, style, and text of Paul's letters. In describing himself as the "writer" of the letter Tertius could have meant: (1) that he took down the letter in longhand from Paul's dictation, (2) that he wrote in shorthand as Paul dictated, or (3) that he more independently composed the letter following directions from Paul. Interpreters have variously defended each method (see the detailed discussion in Cranfield, 2–5).

FLORENCE MORGAN GILLMAN

TERTULLIAN. Tertullian (*floruit* A.D. 197–post 213) (cf. Braun 1977: 567–77) was the first great Latin Christian writer of the West. Critical editions since the Renaissance give his name as Quintas Septimius Florens Tertullianus, but this is because the 15th-century humanists J. Trithemius and Politanus gathered these names from the later manuscript tradition (Labriolle 1947: 95, n. 2). Tertullian referred to himself only as Septimius Tertullianus (*De virginibus velandis* 17.5) (Barnes 1971: 242), as the 4th-century fellow North African, Lactantius, testified (*Divine Institutes* 5.1.23). He has been identified with the Tertullian of the juridical codices (Steinwenter PW 5: 845), but this identification has been disproved (Groh 1970: 104, n. 52; Barnes 1985: 325).

The best ancient witness to Tertullian's biography, Jerome (ca. A.D. 392), tells us that Tertullian was a citizen of Carthage who was the son of a proconsular centurion (*Chronicon; de viris illustribus* 53). Recent challenges to this (Barnes 1971: 11–12) have not been accepted (Schöllgen 1984: 102). Jerome's notice that Tertullian was a priest, however, is surely wrong (Barnes 1985: 323), as are many hypothesized incidents of his biography inferred from his treatises (Barnes 1971: 243–47).

Tertullian was born into what may have been a family of equestrian rank (Groh 1970: 11–14; Schöllgen 1984: 189), one of whose members, a cousin, had published a literary work titled *The Tables of Cebes* (*De praescripto haereticorum* 39.4; Groh 1970: 12). He appears to have been married (cf. *Ad uxorem*). He was bilingual, having written some of his treatises in Greek, and was extremely well educated in rhetoric (Sider 1971). Tertullian was the most learned Christian writer of his day, having read most of the 2d-

century Christian writers before him (Harnack 1914), as well as the Silver Age pagan writers (Barnes 1971: 203). He was known and read by most subsequent North African and Western writers, but his reputation in the East was confined to his authorship of the *Apologeticum,* rendered into a Greek translation by someone else (Harnack 1892: 36), from which Eusebius of Caesarea (ca. 290) quoted (*Hist. Eccl.* 5. 5. 5–7).

Tertullian's writings sound the rigorist strains which will become the themes of North African Christianity throughout its entire subsequent history in antiquity (cf. Frend 1965; 1985): Christianity as the *nova lex;* the centrality of God as lawgiver and judge; fear of God as the foundation of salvation; the "gathered" or "pure" notion of the Church separated from all idolatry of the secular world. His writings are especially important for Western theology because they contain so many of the first Latin appearances of key theological terms—*trinitas, persona, substantia, status, dispositio, dispensatio* (cf. Otto 1960; Braun 1977). Once thought to be the inventor of such a Latin theological vocabulary (Morgan 1928: 39, 41–45), then the voice of an ecclesiastical Latin carried in the Christian community (Schrijnen 1934: 110–11; Teeuwen 1926: XIV–XV, 54; Pétré 1948), Tertullian (see the positions of Becker 1954: 341–43 and Braun 1977: 17–26) is now seen as a linguist of extraordinary sensitivity, capable of creating neologisms in line with current usages of his day (cf., e.g., Braun 1977: 151) but also careful to reflect both contemporary pagan or Christian usage and biblical meanings in his theological terminology (Braun 1977: 17–26; O'Malley 1967: 26–27, 41, 62–63; Stirnimann 1949: 93, 96).

In his writings to A.D. 209, Tertullian acts as the spokesperson for a Latin Christian community centered in the capital and confined to the proconsular province (cf. Barnes 1971: 280–82). The *Acts of the Scillitan Martyrs* (A.D. 180) and the *Martyrdom of Perpetua and Felicitas* (A.D. 203) are our only sources for knowledge of early North African Christianity besides Tertullian. Tertullian's writings give us a picture of a solidly middle-class Christian community (Groh 1970; 1976) with distinctive liturgical and theological traditions, though the origins of this community are not certain; both Roman and Asia Minor roots and connections are indicated. However, Tertullian's audience indicates a highly literate Latin-speaking group, capable of enjoying satire, irony, and, above all, great style as expressed by Tertullian's use of North African rhetoric of the forensic, epideictic, and deliberative genres (Sider 1971) and by his frequent imitation of the great 2d-century writer Lucius Apuleius (Waszink and van Winden 1987: 277). The appellation "Christian Sophist" applied to Tertullian is both apt and nonpejorative (Barnes 1971: 211–32; 1985: 333). Portrayed in earlier scholarship as a writer concerned to vanquish and silence all opponents (Lortz 1927–1928; Nister 1950: 49–51, 68; Steinmann 1967: 70), he has emerged in more recent scholarship as a nuanced interpreter, seeking to bring clarity and unanimity to widely diverse ideas and traditions (Braun 1977; O'Malley 1967: 2, 14, 36).

At the heart of Tertullian's theological method was the drive for *truth* (his most frequent word) and clarity in theological and exegetical matters, perhaps best expressed in his concern for simplicity of meaning (O'Malley 1967: 28, 122, 169). This means that the literal meaning of Scripture, as revealed by the rule of context (both historical and stylistic) is his preferred method of scriptural interpretation (O'Malley 1967: 130–31). Although he will defend allegorical exegesis of Scripture against the heretic Marcion, it is the plain truth of Scripture, represented by the Rule of Faith with its certainties, which binds and contains the conclusions of the theologian or the exegete (cf. *On the Prescription against Heretics* 13–14).

Tertullian's general systematic principle that inner reality (of a person or text) must correspond with outer reality (Groh 1971: 13–14; 1985: 88–90) results both in an increasing moral rigor in his writings and in his late adoption of the philosopher's *pallium* instead of the Roman toga (cf. *De pallio*).

After A.D. 208 (Barnes 1985: 328) Tertullian turned to Montanism and to Montanist prophets to resolve the uncertainties of points of Church discipline which neither theology nor Scripture could settle normatively, such as the proper length of fasts or veils for virgins. His community of Montanist prophets seems to have practiced charismatic exegesis and the production of spiritual psalms and visions (Groh 1985: 92–95). The vision of a Montanist sister confirmed his immanent sense of eschatology when a vision of the heavenly Jerusalem was seen hovering over the earthly Jerusalem (*Adv. marc.* 3.24.4; cf.

Groh 1985: 81). By his later treatises, Tertullian and his group seem to have split from the Catholics of Carthage (Braun 1977: 721), but Augustine's witness to an independent group in his day known as the Tertullianists (*De haeresibus* 86) is not solid (Groh 1970: 18–19; Barnes 1985: 334).

Tertullian's Latin quotations of the Scriptures have been isolated (Roensch 1871), but it is extremely difficult to tell exactly what versions he is using. His habit of glossing a text (O'Malley 1967: 36, 63) and his facility in translating directly from Greek occlude his text traditions. He also quotes with frequent inaccuracy (Waszink and van Winden 1987: 119). Studies indicate that he knew and cited all books of our present NT except 1 Peter, 3 John, and James (Campenhausen 1972: 276, n. 44), that he had at his disposal at least customary readings of certain texts and Latin translations of portions of biblical books (O'Malley 1967: 7, 45, 63; Barnes 1971: 276–78), but no precise text type has emerged (Aland and Aland 1987: 182–83). The problem is complicated by the high degree of theological self-consciousness of Tertullian. For example, his treatise *De oratione* preserves our earliest Latin commentary on the Lord's Prayer with a curious reversal of clauses. While the other clauses follow the Greek and Vulgate traditions, he reads: *"Fiat uolentas tua in caelis et in terra"* ("Thy will be done in heaven and on earth"; *Or.* 4.1) and then (*Or.* 5.1) *"Veniat … regnum tuum"* ("Thy kingdom … come"; cf. also *Or.* 9). It is impossible to tell whether the North African Church's version of the prayer contained this reversal, or whether Tertullian's theological belief (that obedience to the will of God was the heart and substance of the kingdom) caused that reversal (cf. Evans 1953: XIV–XV).

DENNIS E. GROH

TERTULLUS (PERSON) [Gk *Tertyllos* (Τερτυλλος)]. The attorney representing the Jews who brought charges against Paul before Felix the Roman governor of Judea (Acts 24:1–2).

Non-Romans bringing charges before provincial magistrates and unfamiliar with the forms of Roman law used in these courts needed the services of professional advocates. The identification of Tertullus as a *rhētor* (RSV, "spokesman") portrays him as such a professional. It is not certain whether Tertullus was Roman, Greek, or Jewish. In his speech he identifies himself with his clients but this may be his professional stance as their advocate. He appears to be familiar with both Jewish and Roman law, but the main evidence for his familiarity with Jewish law is in the textually questionable vv 6c–8a (RSV margin). The evidence indicates that these phrases are not original, in spite of the manner in which they logically round out the speech. Without their reference to "judging him by *our* law" and "Lysias taking him out of *our* hands" (which accuses Lysias of interference with "due process" in the Jewish right to judge those who profaned the Temple) Tertullus' knowledge of Jewish law is reduced to one general phrase in v 6, "he tried to profane the Temple." On the whole there is little in the speech that would identify him as a Jew.

Luke has composed Tertullus' speech to reflect professional rhetorical style. He begins with a *captatio benevolentiae*, "currying of favor." The excuse to end the praise and proceed with the charges also has rhetorical flair (Conzelmann *Acts* Hermeneia, 198). Tertullus' statement of the charges shifts their originally religious nature (Acts 21:28; 23:29) to one of sedition. Paul is a public troublemaker, a threat to the peace of the empire. Tertullus' prosecution plays on one of the governor's fears in troubled Judea. This touches on a Lukan theme in Acts. Christians are brought before Roman magistrates on various charges and found innocent. This has been seen by some to reflect a pro-Roman apologetic on Luke's part. Romans should grant Christians legal status based on the precedence of earlier decisions. Or it may be that these stories encourage the Christians of Luke's day, faced with difficult decisions in relation to the state, to remain loyal citizens.

Another aspect of Tertullus' prosecution is important to the theology of Acts. It is implied that he represents the Jewish people as a whole and against Paul and thus against the Gospel. He charges Paul with sedition against all Jews everywhere (24:5) and thanks Felix on "behalf of this nation" (24:2). Some scholars have found in these verses additional evidence in support of the idea that Luke "writes off" the Jews in the scheme of salvation in favor of the gentiles. But Luke portrays Tertullus' charges as false (see Paul's defenses). Since this claim to speak for the Jewish people against Paul appears on the lips of a lawyer pressing false charges, that claim also appears as false.

THOMAS W. MARTIN

TESTIMONIA (4QTestim). This leather fragment from Qumran Cave 4 was discovered in 1952 and purchased for the Palestine Archaeology (Rockefeller) Museum. A preliminary edition was published by J. M. Allegro (1956: 182–87) before it was fully presented by him labeled as *4Q175* in DJD 5 (Allegro and Anderson 1968: 57–60; pl. xxi); that edition was thoroughly reviewed by J. Strugnell (1970: 225–29).

4QTestim is a single column in a mid-Hasmonean hand, well preserved apart from the bottom right-hand corner. Its script is very like that of 1QS and can be dated to the early 1st century B.C.E. 4QTestim is important for the form of its biblical texts, its genre, and its implied eschatology and messianism.

4QTestim contains four texts: three biblical texts, Exod 20:21 (Sam. Pent.; = MT Deut 5:28–29 + 18:18–19), Num 24:15–17, and Deut 33:8–11, and one quotation from the fragmentary *Psalms of Joshua* (*4Q379* frag. 22, col. 2, lines 7–14; being edited for DJD by C. Newsom) whose text enables some restorations to be made in corresponding places in 4QTestim and is based in part on Josh 6:26.

Allegro entitled the document *Testimonia*, as it seems to contain a set of proof texts. The form of the document and the quotation of the same texts in other Qumran mss (Exod 20:21 [Sam. Pent.; = MT Deut 5:29 + 18:18–20] in 4QBibParaph; Num 24:17 in 1QM 11:6, CD 7:18–20 and 1QSb 5:27; Deut 33:8–11 in 4QFlor frags. 6–7) support this idea. 4QTestim's genre is used to corroborate theories that early

Christians had collections of proof texts which they used apologetically, as shown by the sequence of Isa 28:16, Ps 117, 118:22, and Isa 8:14 repeated in Matt 21:42, Rom 9:33, and 1 Pet 2:6–8 (cf. *Ep. Barn.* 6:2–4; see Fitzmyer 1957: 534; Prigent 1959: 421–22).

4QTestim is constructed in a very organized manner (Brooke 1985: 311–17). There are no introductory phrases, but the texts are linked through catchword *(gĕzērâ šāwâ)* to each other and may mirror the order of the biblical books (Exodus, Numbers, Deuteronomy, Joshua). Although the text type of these quotations differs slightly from the MT and from all known versions, the opening quotation is closest to Exod 20:21 in the nonsectarian proto-Samaritan tradition (see Skehan 1957: 435; Sanderson 1986: 224–37).

It is generally agreed that the whole document is eschatological. Lübbe (1986: 193–96) has shown how all four texts describe the self-understanding of the Qumran community as under threat. Most other scholars see that viewpoint expressed messianically in 4QTestim 1–20, the three biblical texts describing in turn the prophetlike Moses, the Davidic messiah, and the levitical messiah of Aaron (cf. 1QS 9:11; see Fitzmyer 1957: 84). In fact, Num 24:15–17 by itself (4QTestim 9–13) speaks of three figures: man, star, and scepter. Exod 20:21 (4QTestim 1–8) is placed before Numbers 24 to identify the man (*geber;* cf. 1QS 4:20, 1QH 3:7–10) as the Mosaic prophet, who may also be the Teacher of Righteousness. Deut 33:8–11 (4QTestim 14–20) follows Numbers 24 to identify the star with the levitical messiah of Aaron (as is implied for the Interpreter of the Law in CD 7:18–20). The scepter stands for the Davidic messiah. In addition to their messianic use in other Qumran documents, these texts may have influenced NT traditions: Exod 20:21 (Sam. Pent.) may lie behind Luke 9:35, John 6:14, Acts 3:22–23, and 7:37; Num 24:17 may lie behind Matt 2:2–10, Rev 2:28, and 22:16; Deut 33:8–11 may have influenced the portrayal of Jesus as priest in such texts as John 19:23, Heb 4:14–5:10, and the several traditions that speak of the denial of family (Amusin 1971: 359–61).

Not enough text remains to determine whether 4QTestim 21–30 speaks of two or three people. If the texts in 4QTestim 1–20 speak of three figures, then 4QTestim 21–30 may present their three antitypes, an accursed man who belongs to Belial and his two sons, as the context of Judges 6 suggests. Several scholars have attempted to identify these three figures with Hasmonean enemies of the Qumran community (see Brooke 1985: 309–11); the two possibilities that fit best are Simon (ruled 143–135 B.C.E.) and his two sons Judas and Mattathias, all of whom died at Doq in 135 B.C.E., or John Hyrcanus I (135–105 B.C.E.) and his two sons, Aristobulus I (104 B.C.E.) and Alexander Jannaeus (103–76 B.C.E.). If the extract from the *Psalms of Joshua* mentions only two opponents, then the possibilities for identification are numerous. The identification of the city of 4QTestim 22 and 26 also remains open; Jericho, as in Josh 6:26, and Jerusalem, as in 4QTestim 29–30, are the favorite candidates.

GEORGE J. BROOKE

TESTIMONY OF TRUTH. See TRUTH, TESTIMONY OF (NHC IX,*3*).

TET [Heb *ṭet* (טֵת)]. The ninth letter of the Hebrew alphabet.

TETRAGRAMMATON IN THE NEW TESTAMENT. There is some evidence that the Tetragrammaton, the Divine Name, Yahweh, appeared in some or all of the OT quotations in the NT when the NT documents were first penned. See also NAMES OF GOD IN THE OT; YAHWEH (DEITY). The evidence for this is twofold.

A. Jewish Scribal Evidence

The extant pre-Christian copies of the Greek OT that include passages which in Hebrew incorporate the Divine Name also preserve the Hebrew Divine Name in the Greek text. These copies are (1) P. Faud 266 (=Rahifs 848), 50 B.C.E., containing the Tetragrammaton in Aramaic letters; (2) a fragmentary scroll of the Twelve Prophets in Greek from Wâdī Khabra (=W.Khabra XII *Kaige*), 50 B.C.E.–50 C.E., containing the Tetragrammaton in Paleo-Hebrew letters; and (3) $4QLXX^{Levb}$ (=Rahifs 802), 1st century B.C.E., containing the Tetragrammaton written in Greek letters in the form of *IAO*. The well-known Jewish-Greek versions of the OT that emerged in the 2d century C.E., i.e., those of Aquila, Theodotion, and Symmachus, continued the Jewish practice of writing the Hebrew Tetragrammaton into the Greek text. The evidence, therefore, suggests that the practice of writing the Hebrew Divine Name into the text of the Greek OT continued throughout the NT period. From this it may be concluded (1) that the NT writers had access to copies of the Greek OT that contained the Hebrew Divine Name, and (2) that the NT writers who quoted from the Greek OT had reason to preserve the Tetragrammaton in their quotations.

B. Christian Scribal Evidence

By the time of the earliest extant Christian copies of the LXX (2d or early 3d century C.E.), a clear break with the Jewish practice outlined above is to be observed. The Christian copies of the Greek OT employ the words *Kyrios* ("Lord") and *Theos* ("God") as substitutes or surrogates for the Hebrew Tetragrammaton. The evidence suggests that this had become the practice of Christian scribes perhaps as early as the beginning of the 2d century. Curiously, the surrogates for the Tetragrammaton have been abbreviated by the writing of their first and last letters only and are marked as abbreviations by a horizontal stroke above the word. Thus, for example, the word for "Lord" is written **KS** and for God **THS**. These two so-called *nomina sacra,* later to be joined by thirteen other sacred words, appear also in the earliest copies of the NT, including its quotations from the Greek OT. The practice, therefore, in very early times was consistently followed throughout the Greek Bible.

A conjecture is that the forms KS and THS were first created by non-Jewish Christian scribes who in their copying the LXX text found no traditional reason to preserve the Tetragrammaton. In all probability it was problematic for gentile scribes to write the Tetragrammaton since they did not know Hebrew. If this is correct, the contracted surrogates KS and THS were perhaps considered analogous to the vowelless Hebrew Divine Name, and were certainly much easier to write.

Once the practice of writing the Tetragrammaton into copies of the Greek OT was abandoned and replaced by the practice of writing KS and THS, a similar development no doubt took place in regard to the quotations of the Greek OT found in the NT. There too the Tetragrammaton was replaced by the surrogates KS and THS. In the passing of time, the original significance of the surrogates was lost to the gentile Church. Other contracted words which had no connection with the Tetragrammaton were added to the list of *nomina sacra,* and eventually even KS and THS came to be used in passages where the Tetragrammaton had never stood.

It is possible that some confusion ensued from the abandonment of the Tetragrammaton in the NT, although the significance of this confusion can only be conjectured. In all probability it became difficult to know whether KS referred to the Lord God or the Lord Jesus Christ. That this issue played a role in the later Trinitarian debates, however, is unknown.

TEXTUAL CRITICISM. The name given to the critical study of ancient manuscripts and versions of texts, for the purpose of ascertaining a correct reading of the text. Textual criticism has been applied to both the Hebrew Bible and the Christian New Testament.

OLD TESTAMENT

The goal of OT textual criticism is to analyze and evaluate the data representing the text of the Hebrew Bible and to trace in broad outline the history of this text. For that purpose it collects the relevant data from the Hebrew sources and reconstructs them from the ancient translations (versions). At the same time it examines these data critically by comparing them with parallel material in the MT (see E.3 below). For general summaries and descriptions of OT textual criticism, see Deist 1978; Klein 1974; McCarter 1986; Roberts 1951; Weingreen 1982; and Würthwein 1979).

A. Introduction

1. Nature and Goals of Textual Criticism. At some point scholars have to form an opinion on the question of whether or not there once existed an (one) original textual form ("Ur-text") or several pristine forms of the biblical books; if either of these questions is answered in the positive, one then has to express an opinion regarding the nature of that (or those) original text(s). To determine one's position with regard to that text is important not only for abstract scholarly purposes, but also for obtaining clarity regarding the very nature of the textual procedure (described in section E below).

The majority opinion holds that there once existed an Ur-text, although often the implications of such an assumption have not been thoroughly considered. Given the present state of knowledge, the assumption of an Ur-text is the most logicial one, especially because the alternative (multiple "original" text forms) cannot be substantiated. The existence of synonymous readings or cases in which the original reading cannot be determined does not undermine the correctness of this supposition as much as it reflects our own inability to reconstruct the original text. The reconstruction of elements in the assumed Ur-text thus remains one of the aims of the textual critic, even if it is virtually impossible to determine what stage in the development of a given biblical book should be called the Ur-text.

Since literary (or "higher") criticism deals, inter alia, with the literary growth of the books, and since textual (often wrongly called "lower") criticism deals with the transmission of that finished text, we may consider the Ur-text broadly to be the finished literary product which stood at the beginning of the stage of textual transmission; textual criticism thus aims for the reconstruction of that text. (For complications deriving from this definition, see section F.) Several scholars, for example Greenberg (1978) and Talmon (*CHB* 1: 162), do not accept the assumption of an Ur-text, but rather think in terms of several parallel pristine texts.

The nature of OT textual criticism is best seen by comparing it with that of other works of literature. Such a comparison shows that the textual criticism of the OT has its own character in the following respects:

(a) In contrast to the textual criticism applied to many other works of literature, that pertaining to the OT does not seek to reconstruct the original form of the *complete* text of the biblical books, much less to determine the *ipsissima verba* of the authors of these books (the same holds true for the criticism of Homer's *Iliad* and *Odyssey,* works which supposedly went through a similar literary history). The most that could be achieved would be to reconstruct *elements* of the Ur-text. Some scholars define the aim of textual criticism in a seemingly more modest way, referring to the OT text current in a particular period (usually the 4th or 3d century B.C.). The recovery of that stage of the text would represent a more realistic goal than recovering the end product of the literary growth. However, this definition in fact is not more modest, since at that period the biblical text was current in different forms which cannot be reconstructed. Adherents of the "oral tradition" theory are compelled to work with a broader definition of the goals of OT textual criticism, because in their view the books of the OT never existed in one original text but only in various oral formulations (see Nyberg 1935; van der Ploeg 1947).

(b) It is often thought that textual criticism aims to produce "eclectic" editions of the texts studied, that is, editions that attempt to reconstruct the original text of the composition through a selection of readings from various sources. For theoretical as well as practical reasons this cannot be the task of OT textual

criticism, because not all scholars agree that at one time there existed an original text of a biblical book; and even if such had existed, practical problems make its reconstruction difficult (see further B.5.a below).

Because of these problems, most of the existing critical editions of the OT are not eclectic but "diplomatic"; that is, they reproduce a particular form of the *textus receptus* ("received text") of the OT as the base text, while recording divergent readings (or "variants") from Hebrew and non-Hebrew sources in an accompanying critical apparatus. In contrast, most modern translations of the OT are by nature eclectic: while adhering basically to the MT, they often replace some MT readings with parallel ones from the versions (mainly the LXX) and the Qumran scrolls.

2. Need for and Importance of Textual Criticism. The realization that the OT must be examined text-critically is relatively new. It has come about slowly through the discovery of new sources and through an increase in critical awareness. Meanwhile the necessity of a text-critical analysis of the OT should be justified not only on the basis of historical considerations but also in view of the internal differences between the various sources of the OT text.

a. Internal Differences between Editions and MSS. Except in the case of photographic reproductions of the same text, no two printed editions of the Hebrew Bible are identical. The differences among them generally have to do with minimal, even minute, details of the text (single consonants, vowel signs, accents, text arrangement, numbering of verses, division into chapters and verses, Masoretic notes). In a few cases, however, they concern entire words (e.g., some editions of Prov 8:16 read *ṣedeq*, "righteousness," but others *ʾāreṣ*, "earth"). Older printed editions contain several misprints, and this is even true of many modern editions. Thus, some printings of the much-used 1852 Letteris edition read *mošet* (a nonexistent word) instead of *mošeh* (Moses) in Num 11:30, and *šālaktā* (wrong spelling of "you sent") instead of *šālaḥtā* ("you sent") in Jer 29:25. Even the most "accurate" edition, the 1984 printing of *BHS*, contains several misprints and inaccuracies.

Disregarding these printing errors, most variations between the printed editions go back to differences in the mss on which they are based. With the exception of the chapter and verse divisions, which are not found in them, these mss differ from each other in the same manner as the printed editions referred to above. To be exact, the differences between the Masoretic mss (see B.1 below) are small, while older sources such as the Qumran scrolls often display major variations among themselves (see D.4 below).

b. Differences between Inner-Masoretic Parallel Texts. In parallel versions of one biblical source—such as 2 Samuel 22 and Psalm 18, Psalms 14 and 53, and in large sections of the books of Samuel–Kings and 1–2 Chronicles (see Vannutelli 1931–34; Bendavid 1972)—it is possible to notice many textual differences representing variants that originated in an early stage of the history of the text. These textual variations, distinct from redactional, linguistic, and stylistic changes, give a good idea of the relationship between the texts in a very early stage of the transmission (for examples, see section D below). It is exactly these parallel biblical passages that have prompted the development of OT textual criticism precisely because they necessitated the comparison of texts.

3. History of Investigation. Not only the comparison of parallel texts in the OT but also the differences among the Masoretic mss and the independent analytical examination of the MT led very early to the conclusion that the biblical text is corrupt in a number of places. This conclusion provoked many theological and philological discussions in the 17th and 18th centuries about the authority of MT as well as that of the LXX and the Samaritan Pentateuch (Sam. Pent.).

The first rather complete analyses of the OT text are those of J. Morinus, *Exercitationes biblicae de hebraei graecique textus sinceritate* (1633, 1660), and L. Cappellus, *Critica sacra* (1650, 1675–78). After the middle of the 17th century there appeared a great many treatises on the OT text, though it should be noted that in this and the following century the borderline between textual criticism and theology is often vague. Scholars at that time involved in the critical study of the OT text included Buxtorf, Hottinger, Morinus, Cappellus, Spinoza, Richard Simon, Houbigant, Kennicott, and de Rossi. The works of these scholars have been described in detail by Rosenmüller (1797), Keil (1859), and Barthélemy (1982: 1–63).

Of the many names that could be mentioned from the 19th century, de Lagarde, Perles, Cornill, and Wellhausen are noteworthy because of their remarkable insights into textual criticism.

In many areas of OT textual criticism it is often best to start with older works, since in textual criticism (called an art by some and a science by others) an intuitive grasp of the issues underlying divergent texts is just as important as recently discovered data: Wellhausen (in his 1871 commentary on Samuel), König (1893), and Steuernagel (1912: 19–85) in particular all exhibited that kind of intuition. At the same time, the modern description of OT textual criticism will differ significantly from earlier discussions because of the relevance of the newly discovered Qumran scrolls to almost every aspect of textual criticism.

B. Textual Witnesses

There are many witnesses to the biblical text, both in Hebrew and in other languages. Of these, the Hebrew sources are the easiest to analyze, while those in the other ancient languages must first be retranslated into Hebrew. (The relation between these witnesses is discussed below in C.2.) For obvious reasons the analysis proceeds from the Hebrew sources (especially the MT) since, as the "received text" within Judaism and Christianity, it is the primary object of scholarly attention. Even though our discussion begins with this "received" text, it is important to remember that the MT is not intrinsically "better" than the other texts.

Until the middle of the 20th century the earliest witness to the Hebrew text was the so-called Nash papyrus from the 1st or 2d century A.D. (actually a liturgical text), containing a combined version of the Exodus and Deuteronomy texts of the Decalog. But textual research underwent very significant changes with the discovery of the Qumran scrolls. This new material now must occupy the center of modern descriptions of the biblical text.

1. The Proto-Masoretic Texts and the MT. The MT of the Hebrew Bible, so named because of the subsequent addition of the Masorah to the consonantal framework, does not in fact exist in any one source and may never have existed as one textual unit. Rather, different manifestations of that textual form are known, so that it would be more correct to speak of a group of "Masoretic Texts." Like most of the witnesses to be discussed below, the content of the MT cannot be characterized in general terms, so that one must be content with describing the MT as a "text." This text was perpetuated by influential circles in Judaism (the Pharisees?); some scholars believed they also partly created this text, although there is little evidence in favor of this. Socioreligious reasons thus made the MT the most significant of the biblical texts. See MASORETIC TEXT.

The MT resulted from a combination of five elements: (1) the consonantal text; (2) certain para-textual elements; (3) the Masorah itself; (4) a vocalization scheme; and (5) cantillation signs (each is discussed below). The word "Masorah" generally refers to the latter four elements; however, in the technical sense of the word "Masorah" refers only to one of the elements, a specific type of apparatus written around the text (B.1.d below).

a. The Masoretes. The Masorah was prepared in the period between A.D. 500 and 1000 by succeeding generations of scribes who occupied themselves with the transmission of the biblical text. Little is known of the background of these Masoretes. In their composition of the Masorah, they built on the work of earlier generations of *sôpĕrim,* which literally means "scribes," but has also been reinterpreted as "men who occupied themselves with counting *[spr]*" the letters and words of the consonantal text of Scripture (*b. Qidd.* 30a). According to tradition, the copying of the Pentateuch started with Ezra, who is called a *sôpēr māhîr* ("fast writer") in Ezra 7:6 and is considered the *sôpēr* par excellence in rabbinic tradition.

The Masoretes not only transmitted the consonantal text, but also devised vocalization and accent systems for it. Their labor had both technical and creative aspects; technical insofar as it concerned the mechanics of copying and counting letters, words, and verses; creative insofar as it concerned the invention of a scheme for recording vocalization and accents. While doing this, the Masoretes also formed mechanisms to assure that special care would be exercised in the transmission of the text; the word "Masorah" in its technical sense refers only to these latter mechanisms. See MASORETES.

b. The Consonantal Text. The received consonantal text preceded the one that includes the vocalization and accents. Both of these circulated in many slighly deviating forms, and were finally

stabilized only with the advent of the printed Rabbinic Bible toward the end of the 15th century (see B.1.g below). However, earlier forms of the MT come close to such a stabilization. The earliest attestations of the consonantal framework of the MT—found in many, but not all, Qumran texts—date to around 250 B.C. Their resemblance (especially 1QIsa ^{b}) to the medieval form of the MT is striking, showing how accurate the transmission of the MT was through the ages. These earliest attestations are called "proto-Masoretic" since their consonantal framework formed the basis for the later Masoretic mss.

Although most of the preserved biblical texts reflect the MT, we also know of several sources current before A.D. 70 that reflect substantial deviations from the MT: these include the LXX, the proto-Samaritan sources, the Sam. Pent., and various Qumran scrolls. Afterward, the MT became virtually the sole witness to the biblical text, challenged only by the continual use of the Sam. Pent. and the LXX. Furthermore, the biblical quotations preserved in Talmudic literature and in the *piyyûṭîm* (liturgical hymns) generally reflect the MT, although sometimes they deviate from it in details. These differences were examined in great detail by Aptowitzer (1906–15), and especially due to the influence of Kahle (see C.3 below) their significance and number have generally been exaggerated (since the majority of the quotations actually agree with MT).

The ensemble of the Masoretic mss constitutes a distinct group, even though no single extant mss is entirely identical with any other. The work of copying, certainly in earlier times, always created variations between the basic text and the copy. Furthermore, though the consonantal text was already consolidated in the 1st and 2d centuries A.D., all the mss from that period onward differ from each other in numerous details, more so in the early centuries than in the medieval period.

In the description of the development of the consonantal text underlying the MT, three periods can be distinguished, although they cannot be clearly demarcated due to insufficient information. The first period ended with the destruction of the Second Temple. The proto-Masoretic mss of this period, mainly from Qumran (150 B.C.–68 A.D.) and Masada (until 73 A.D.), comprise a tightly closed group, almost identical in content with the medieval sources. At this early period one may still find differences between the various sources in words and phrases, discernible, for example, from a comparison of 1QIsa ^{b} and other Qumran texts or medieval sources. Talmudic and later rabbinic literature have preserved other early variants. Still other early variants are found in the Masoretic *madinḥa›ē* and *ma‹arba›ē* readings (see B.1.d below) and in the Masoretic handbook *Minḥat Shay*.

The second period begins with the destruction of the Second Temple and ends in the 8th century, most of the evidence coming from the beginning and toward the end of the period. The scrolls from Wâdī Murabba‹at and Naḥal Ḥever in the Judean desert (antedating 132–35 A.D.) are the best witnesses for the beginning of the period. Most of these sources (such as the Minor Prophets scroll from Wâdī Murabba‹at) are virtually identical with the medieval ones, although there are differences in small details. Non-Hebrew sources from this period include the Greek translations by Kaige-Theodotion, Aquila, and Symmachus, the Aramaic Targums, and the Vulgate (on all these, see B.5 below). From the end of this period come the earliest documents from the Cairo Genizah.

The third period begins in the 8th century and continues until the 12th century. The earliest dated Masoretic mss proper are from the 9th century, and are characterized by the introduction of vocalization, cantillation signs, and the Masorah. The consonantal texts of the individual codices are virtually identical.

At the end of the first stage of the development of the MT a conscious attempt was made not to insert any more changes in the text and to transmit the text as precisely as possible. However, since a variety of texts already existed within the proto-Masoretic group, the presence of textual variants could not be avoided, so the idea of textual uniformity remained an abstract ideal. The variants current in this first period as well as in the second one are mainly from earlier textual traditions and often can still be found in non-Masoretic sources such as the LXX and Qumran texts.

In contrast, the vocalized "Masoretic" mss of the third period preserved only a few variants deriving from earlier periods. Almost all variants from this period resulted from errors stemming from the frequent copying of mss in the Middle Ages. A good description of the typical characteristics of medieval mss is given by Goshen-Gottstein (1975). For the text-critical study of these mss it is important to remember that

they are not to be regarded as one single source, as is often assumed in scholarship. Every individual ms must be compared separately with non-Masoretic sources, and in that way some mss (those denoted as 30, 93, 96, 150 by Kennicott) will be recognized as containing more substantial variants than others. Furthermore, it can be demonstrated that the medieval mss are to be subdivided into independent geographical groups (Italy, Germany, France, Spain), of which the group from Spain contains more ancient variants than others (Cohen 1973). Nevertheless, the consonantal text of no single ms is significantly of greater importance than that of any other one. The variants in the medieval (12th century and later) mss were collected by B. Kennicott, *Vetus Testamentum hebraicum cum variis lectionibus I-II* (Oxford, 1776–80), and J. B. de Rossi, *Variae lectiones Veteris Testamenti I–IV* (Parma, 1784–88; repr. Amsterdam, 1969). A summary edition that includes the variants of these two collections was published in 1818 by J. C. Döderlein and J. H. Meisner. The more recent editions of C. D. Ginsburg (*The Twenty-four Sacred Books …* [London, 1896]), the *BHS,* and *The Hebrew University Bible* (see E.2 below) also quote from older medieval mss.

c. Para-textual Elements. Once it became unacceptable to make any more changes to the biblical text, the earliest generations of the *sôpĕrîm* directed their activities toward accurately recording all the peculiarities in their mss. These peculiarities attested early scribal practices also reflected in the Qumran scrolls and in Hellenistic scribal traditions. (For a detailed description of these elements, see Ginsburg 1897.) The most important practices were associated with the following six phenomena:

(1) Paragraphs. With painstaking care the Masoretes transmitted the division of the text into paragraphs (Heb *pārāšâ,* pl. *pārāšiyyôt*), which resembled the system now also attested in most Qumran texts. They distinguished between small textual units separated from each other by open spaces between verses within the line (*pārāšâ sĕtûmâ,* "closed section," indicated with the letter *samek*), and larger textual units separated from each other by spaces that leave the whole remaining line blank (*pārāšâ pĕtûḥâ,* "open section," indicated with the letter *pe*). The Masoretes also indirectly indicated versification (with the *silluq* accent), following an ancient tradition indicated (by spaces) in a few Qumran texts (1QLev, 4QDan a,c) and in several Greek texts such as 8ḤevXII. (The actual *numbering* of the verses was accomplished only in the 13th century.)

(2) Inverted *Nuns.* The original purpose of these signs (found mainly before and after Num 10:35–36) was to indicate that the passage does not belong in the present context (cf. *Sipre* 84 on Num 10:35). In the Masoretic tradition these signs developed into that of inverted *nuns,* but originally they had the form of a sigma [(] and an antisigma [)], also found in 11QpaleoLev, 1QS, 1QM, and in the writings of the Alexandrian textual critics indicating elements that did not belong to the text. These are the forerunners of our modern parentheses.

(3) Puncta Extraordinaria. Supralinear (occasionally in combination with infralinear) points are found in fifteen places in the OT (e.g., Gen 33:4; Ps 27:13). While these points originated from scribal notations indicating that the elements thus highlighted should be deleted (a convention used in many Qumran texts), within the Masoretic corpus these symbols were reappropriated to indicate doubtful letters (cf. Butin 1906 and Talmon [in the 1969 reprint of Butin 1906] *apud* Butin and the explanation in ʾ*Abot R. Nat.,* version A, 34). Similar signs are found in Hellenistic texts (cf. Lieberman 1962: 43–46).

(4) Suspended Letters (Litterae Suspensae). In the mss some letters are intentionally placed higher than those around them (i.e., "superscripted" between surrounding letters). A good example is the suspended *nun* in Judg 18:30, where the text with the *nun* is read *mnšh* (Manasseh) or without the *nun* as *mšh* (Moses). As in the Qumran texts, the suspended letters indicate later additions, which nevertheless were transmitted as such in the MT.

(5) Special Letters. The special form of some letters directs the reader's attention to details that were important for the Masoretes, such as the middle letter or word in a book. For a *littera minuscula* see Gen 2:4; for a *littera majuscula,* see Lev 13:33. In other instances imperfectly written letters are indicated especially.

(6) *Tiqqûnê sôpĕrîm* (Emendations of the Scribes). This phenomenon is not a para-textual element per se but rather is part of the *Masorah parva.* The term refers to words (18 or 11 depending on the sources;

the oldest source is the *Mekilta* on Exod 15:7) that tradition says were changed by the *sôpĕrîm;* e.g., "my wickedness" (Num 11:15 MT) replaced an original reading "your wickedness." All supposed emendations concern minor changes in words that the *sôpĕrîm* deemed inappropriate for God or (in one instance) Moses (Num 12:12). In some sources these corrections are called *kinnûyê sôpĕrîm* ("euphemisms of the scribes"), implying that the *sôpĕrîm* had a different understanding of these words without, however, changing the text itself. See also SCRIBAL EMENDATIONS; BIBLE, EUPHEMISM AND DYSPHEMISM IN THE. Many details in the list of *tiqqûnîm* are dubious. Nevertheless, it is considered likely that theological alterations have been made in the text (see D.4 below), even though the specific *tiqqûnê sôpĕrîm* which have been transmitted may not give the best examples of this process (see McCarthy 1981).

d. The Masorah. The desire of the Masoretes to transmit the text as precisely as possible is manifested in a corpus of literature which was especially designed for this purpose (see Leiman 1974). These mechanisms actually developed far beyond the original intent into collections of notes written not only alongside the text but also in separate volumes of detailed observations on the biblical text (especially observations about orthography, since the scribes were most likely to err in these details).

The Masorah (literally, "transmission" or "tradition") in the narrow sense of the word is an apparatus of references and remarks written around the text about (especially orthographic) details in the biblical text. It was composed to facilitate the accurate transmission of the text. The best-known and most influential Masorah is the Tiberian (see Yeivin 1980). See also MASORAH.

The *Masorah parva* (or "smaller Masorah"), written in the margins between columns, contains observations about the number of times a word (or phrase) occurs in a given spelling in a biblical book or in the OT as a whole. The remarks pertain only to the orthography of words whose spelling deviates from the rules devised by the Masoretes themselves. The notes constituting the *Masorah parva* are often inconsistent or inaccurate. This results from the fact that it was initially transmitted alongside of its companion biblical manuscript, and consequently several forms of the Masorah circulated, each accompanying its own manuscript (subsequently, Masorah could be transcribed onto the margins of mss to which they originally did not apply).

Three groups of notations associated with the *Masorah parva* are especially important. The first group of notations designates words that should be read *(qĕrê)* instead of the ones written *(kĕtîb)* in the text; for example, in Jer 2:24, *napšô* (K) should be read *napšâ* (Q). Earlier mss indicated the presence of a Qere by a sign in the margin (a vertical line resembling a final *nun*); in later mss the Qere was indicated by the letter *qop* (for Qere). In most mss and printed editions the consonantal text of the Kethib is pointed with the vowels of the Qere, while the marginal Qere itself remains unvocalized. In some cases whole words were "written but not read" (*kĕtîb wĕlā᾽ qĕrê*) and others "read but not written" (*qĕrê wĕlā᾽ kĕtîb*). See KETHIB AND QERE.

The Qere words can be subdivided in different ways, but it should be remembered that most Qere words differ only in one letter from the corresponding Kethib. The classification and analysis of Gordis (1971) is the best modern introduction to the problem of the Kethib and Qere. Opinions vary about whether the Qere represents a Masoretic "correction," a textual variant, or something else. The Masoretes themselves seem to have regarded the Qere as a correction of the Kethib, and therefore in their reading the Kethib was to be ignored. In line with this tradition, some modern scholars maintain that all Qere words were indeed intended as a correction of the Kethib. For the following reasons, however, this seems doubtful: (1) some (types of) words that constitute the Qere word in one verse are the Kethib word in other verses; (2) every category of Qere words contains instances that are not "corrected" elsewhere; and (3) in some passages the Qere words are grammatically impossible or contextually awkward, and therefore hardly constitute "improvements." Gordis' statistics show that as a rule, the Qere and Kethib are equal in value and that the Kethib sometimes offers a better reading than the Qere. For that reason, other scholars believe that all the Qere words were originally textual variants—differing in one or two consonants—that subsequently came to be regarded as corrections since they had been written in the margin. Gordis offers a middle course between these two views by suggesting two stages in the development of the Qere.

Initially, the Qere was intended as a correction, particularly to discourage blasphemy, such as the *Qere perpetuum* (the constant Qere) of the written Tetragrammaton (YHWH) to be read as *ʾădōnāy.* Subsequently, the already existing system of incorporating corrections as marginal notes was also used to preserve for posterity deviant/variant readings. Still later, all these marginal notes came to be (mis)understood as corrections. Recently, Barr (1981) suggested that the Qere words originated in the "reading tradition" because there is never more than one Qere word.

The second group of notations associated with the *Masorah parva* is indicated by the notation *sĕbîrîn,* followed by an almost identical word (e.g., *mmnw/mmnh* in Judg 11:34). The *sĕbîrîn* notations closely resemble those of the Qere; indeed, various words indicated as Qere in some mss are indicated as *sĕbîrîn* in others. The term is an abbreviation of *sĕbîrîn wĕmaʿṭîn,* i.e., "one might think" *(sbr)* that x should be read instead of y, but that is a "wrong assumption" *(maʿṭîn).*

Third, the *Masorah parva* mentions some 250 consonantal variants between Palestinian (*maʿarbāʾê,* or "western") and Babylonian (*mādînḥāʾê,* or "eastern") readings.

The *Masorah magna* (or "larger Masorah"), written in the spaces above and beneath columns (and sometimes in the margins), mentions the exact verses the *Masorah parva* refers to.

e. Vocalization. Vocalization and accents were added to the consonantal text of MT at a relatively late stage. This additional layer of information is known only from the MT, but is similar to the tradition of reading the Sam. Pent. During the Middle Ages the Samaritans developed a system of vocalization, but the mss of the Sam. Pent. remain without systematic vocalization. The problems which in the MT were addressed by the added vocalization were solved 1,000 years earlier in a different way in the scrolls written in the "Qumran system" of spelling, where an extremely full spelling facilitated the vocalized reading.

The purpose of vocalization was to solidify the reading of the text in a fixed written form on the basis of the oral tradition which had been stable in antiquity (note the large amount of agreement between the content of the Masoretic vocalization and the text presupposed by the LXX). As with all other forms of reading (vocalization), the Masoretic system reflects the exegesis of the Masoretes, although the greater part of it is based on earlier traditions.

The modern editions reproduce (with internal differences) the textus receptus both of the consonants and of the vocalization. This is also true of most mss, but recent findings and studies have shown that this textus receptus is only one of many systems. (For the history of vocalization and the different systems, see MASORETIC ACCENTS.)

(1) The Tiberian Vocalization. Of the various vocalization systems, the Tiberian has become the most widely accepted. More and more details of the other systems (Palestinian, Babylonian) are becoming known through the discovery of such mss, especially from the Cairo Geniza (a storeroom for sacred writings) discovered at the end of the last century, and from Yemenite mss preserved through the ages by the Yemenite community. The differences between these systems pertain to pronunciation, the graphic form of the vowel markers, and the conception of basic linguistic entities such as the *matres lectionis* and the *šĕwâ.* The Tiberian vocalization found in mss dating from A.D. 850 to 1100 is of greater importance for the reconstruction of the vocalization systems than those of the later mss, since the earlier sources (the Aleppo codex; codex Leningrad B 19a; the Cairo manuscript of the Prophets; British Museum Or. 4445; Sassoon 507, 1053; and various mss from the collection of Firkowitch in Leningrad) indicate the original systems of the Masoretes (sometimes inserted by them), while the later sources have been contaminated in the course of the transmission.

In the circles that occupied themselves with the vocalization of the biblical text from the 8th to the 10th century A.D. in Tiberias, the most prominent families were those of Ben-Asher and Ben-Naphtali. The Ben-Asher system was later accepted universally, while that of Ben-Naphtali came into disuse. It is not known whether any of the transmitted mss offer a purely Ben-Naphtali tradition; hence not all details about this system of vocalization are known, even though one learns much from the "variants" between it and Ben-Asher (see Lipschütz 1965).

In the Ben-Asher family, the most developed system is that devised by the last grammarian of that family, Aharon ben-Moshe ben-Asher (ca. 925). It was once assumed that the Second Rabbinic Bible contained the text of Ben-Asher, although now it seems that this edition contained an eclectic text from various mss (see Penkower 1982) and that in the preparation of this text the editor was often guided by his own grammatical rules (e.g., with respect to the *metheg,* the sign for secondary emphasis). Most scholars today believe that codex Leningrad B 19a (A.D. 1009) is the best complete representative of the Ben-Asher text; hence the *Biblia Hebraica (BHK)* and *Biblia Hebraica Stuttgartensia (BHS)* are based on this codex. Many, however, have recognized that the Aleppo codex is the most authentic representative of the Ben-Asher tradition, because this codex was vocalized and supplied with Masorah by Aharon ben-Moshe himself. The fame of this manuscript must be attributed largely to Maimonides, who declared it to be the authoritative text of the Bible. Kept for centuries by the Jewish congregation of Aleppo (Syria), this ms was thought to have been lost in a fire in 1948; in fact, only the pentateuchal portion was lost while the other books were saved. A facsimile edition of the surviving part of the Aleppo codex was published by Goshen-Gottstein in 1976; its vocalization is described in detail by Yeivin (1968). This codex is the basis for the edition of the *Hebrew University Bible Project (HUBP).*

(2) The Character of the Masoretic Vocalization. Transcriptions of biblical texts in the second column of the Hexapla and in Jerome's Bible commentaries often present traditions that differ from the Masoretic vocalization devised much later. Because of these data, several scholars (esp. Kahle 1959: 149–88) have contended that the Masoretic vocalization reflects a late artificial system created by the Masoretes themselves, who rejected earlier systems. Kahle based his view especially on the double pronunciation of the letters *b, g, d, k, p, t,* and the form of the suffix of the second-person masculine singular personal pronoun (in the Masoretic tradition this is *-ĕkā,* but in the earlier sources it is *-āk*). However, the Qumran texts have confirmed the antiquity of the Masoretic pronunciation, not only with respect to this pronominal suffix but also in other details (see esp. Ben-Hayyim 1954).

f. Cantillation Signs (Accents). See MASORETIC ACCENTS.

g. Printed Editions. Many scholars believe that the most ideal edition would be one based on a single manuscript, since it would consequently be a faithful representation of one existing system. Such editions have appeared only recently, however (see below). In the past, editors composed their respective texts from a variety of mss that they deemed suitable, rarely mentioning their sources for the individual elements of the text. Moreover, they allowed their own grammatical ideas to influence the text. Even though the differences between the printed editions are minor, these small variations are important for the grammatical analysis of the text.

The first printed edition of the complete text appeared in 1488 in Soncino, a small city in the vicinity of Milan. Particularly important for the advance in biblical research have been the so-called polyglots, multilingual editions that give the text of the Bible in parallel columns in Hebrew (MT and Sam. Pent.), Greek, Aramaic, Syriac, Latin, and Arabic, accompanied by Latin translations and introduced by grammars and lexicons. The first is the Complutensian Polyglot (1514–17), prepared by Cardinal Ximenes in Alcala (Latin: Complutum). The second was published in Antwerp (1569–72), the third in Paris (1629–45), and the fourth, the most extensive, in London (1654–57), edited by B. Walton and E. Castell.

The so-called Rabbinic Bibles have proved to be of great importance for the history of the printed text. These editions contain in parallel columns the MT and Aramaic Targums, along with various rabbinic commentaries. The earliest editions of the Rabbinic Bible were printed in Venice by Daniel Bomberg, the first (1516–17) edited by Felix Pratensis and the second (1524–25) by Jacob Ben-Hayyim, based on various Spanish mss (see Penkower 1982). The latter edition differs from the former in the addition of the *Masorah parva* and *Masorah magna.* Probably because of this Masoretic apparatus, subsequent generations regarded this edition as the textus receptus of the Hebrew Bible. For that reason by far the majority of the editions of the Bible (with the exception of some modern editions) derive from the text of Ben-Hayyim. They differ only as to where they remove errors, where they introduce new ones, or where they add details from other mss that the editor deemed important.

In the course of the centuries, hundreds of editions of the Hebrew Bible have appeared, of which the most important are those of J. Buxtorf (1611), Athias (1661), Leusden (1667), Jablonski (1699), Van der Hooght (1705), Michaelis (1720), Hahn (1831), Rosenmüller (1834), Letteris (1852), and Koren (1965–66).

Since the end of the 19th century, scholars have been aware of the need for more accurate editions based on critical principles. Baer and Delitzsch tried to reconstruct the Ben-Asher text on the basis of (among others) Ben-Asher's grammatical treatise *Diqdûqqê haṭṭĕʿāmîm* (published by Baer and Strack in 1879). Ginsburg hoped to reconstruct the Ben-Asher tradition on the basis of his thorough knowledge of the Masorah. His analysis of the Masorah prompted him to make the Second Rabbinic Bible the basis of his 1894 edition, to which he added a critical apparatus containing variants from various mss and printed editions. A few modern editions are based on single sources: Snaith's 1958 edition is based on BM Or. 2375, 2626–28; Dothan's 1975–76 edition and the *BHS* are based on the codex Leningrad; and the *HUBP* edition is based on the Aleppo codex. (For these latter two editions, see E.2 below.)

In recent years the complete text has been made available in machine-readable (computer) form. Several computer texts, based primarily on the *BHS* and/or the codex Leningrad B19A, contain all components of the biblical text as well as a detailed morphological analysis. (For bibliographical details, see *Centre: Informatique et Bible. Bible Data Bank, List of Data and Services* [Maredsous, Belgium: 1981].)

2. Proto-Samaritan Texts and the Samaritan Pentateuch. Among the early attestations of the biblical text, the so-called proto-Samaritan sources hold an important place. These sources contain early nonsectarian texts (see B.2.c below), on one of which was based the Samaritan Pentateuch (Sam. Pent.). In its present form, the Sam. Pent. contains a clearly sectarian text. However, when its thin sectarian layer is removed, together with that of the Samaritan phonetic features, the resulting text probably did not differ much from the texts we now label "proto-Samaritan." Because of this relationship, the proto-Samaritan sources should be discussed first; however, the fragmentary state of their preservation in contrast to the full evidence relating to the Sam. Pent. leads us first to consider the latter. (For a more complete survey of editions and translations of the Sam. Pent., as well as the history of scholarly study on it, see SAMARITAN PENTATEUCH.)

a. Origin and Background of the Samaritan Pentateuch. The Sam. Pent. contains the sacred writings of the Samaritans, presently a community of a few hundred members living mainly on Mount Gerizim (near Shechem, modern Nablus) and in Holon (near Tel Aviv). These sacred writings contain only the Pentateuch, while a Samaritan version of Joshua (see Gaster 1908) is also known.

Opinions vary about the origin of the community (see Purvis 1968). The Samaritans themselves believe that the origin of their community goes back to the time of Eli (11th century B.C.), when the "Jews" withdrew from Shechem to establish a new cult in Shiloh, which was later brought to Jerusalem. According to this conception, the Jews split off from the Samaritans, not the other way around. A different view is reflected in 2 Kgs 17:24–34, according to which the Samaritans were not originally Jews, but pagans brought to Samaria by the Assyrians after the fall of Samaria in the 8th century B.C. In accordance with this tradition, in the Talmud the Samaritans were indeed named Kythians (cf. 2 Kgs 17:24).

b. The Character of the Sam. Pent. The textual character of the Sam. Pent. is usually studied by comparing its readings with the MT (Waltke 1970), and since the list by Castellus in the London polyglot (vol. 6, 1657) a figure of 6,000 such differences is usually cited. This detail has to be reexamined now on the basis of modern critical editions.

Study of the proto-Samaritan texts has facilitated the separation of early elements in the Sam. Pent. from elements subsequently added by the Samaritans. The details of this distinction are subject to further research, but the distinction itself is probably correct. It had been surmised by recent generations of scholars that the Sam. Pent. consists of two different layers, but the exact nature of these layers could be studied only with the aid of the new finds. It has now been clarified that the second layer is thin and that if this layer is "peeled off" the proto-Samaritan base text becomes visible.

(1) Early (proto-Samaritan) Elements in the Sam. Pent. (a) Harmonizing Alterations. The Sam. Pent. contains various kinds of harmonizing alterations, especially additions (to one passage on the basis of another one) that, by definition, are secondary. These alterations appear inconsistently (i.e., features which have been harmonized in one place have been left in others). The Sam. Pent. was not sensitive to differences between parallel laws within the Pentateuch, which, as a rule, have remained intact, while differences between parallel narrative accounts, especially in the speeches in the first chapters of Deuteronomy and their "sources," were closely scrutinized.

The most frequent type of harmonizing alterations happens when one of two differing parallel verses in the Sam. Pent. is adapted to the other (for the editorial principles, see Tigay 1985: 53–96; Tov 1985). Thus, in the MT the Fourth Commandment in Exod 20:8 begins with *zākôr* ("remember") and in Deut 5:12 with *šāmôr* ("observe"), but the Sam. Pent. reads *šāmôr* in both verses. As a rule, however, the Sam. Pent. puts both parallel verses (or parallel details) after each other in the earlier of the two texts. Thus the parallel verses from Deut 1:9–18 are added in Exodus (after 18:24 and within v 25), resulting in a double account of the story of Moses' appointing of the judges. For similar additions, see Num 10:10 (= Deut 1:6–7) and 12:16 (= Deut 1:20–23). In this way the nature of the book of Deuteronomy as a "repetition of the law" (*mišnēh tôrāh*in Jewish sources) has been reinforced, since on a strictly formal level Deuteronomy can only "repeat" something if it is also found verbatim in an earlier book.

Another kind of harmonizing change concerns the addition of details in the Sam. Pent. with which the reader should actually be familiar, even though they are not explicitly mentioned in the Bible. In Exod 14:12, for example, the Israelites murmur against Moses after he has led them through the Red Sea: "Is not this what we said to you in Egypt, 'Let us alone and let us serve the Egyptians'?" This complaint is not mentioned earlier in the MT; but the Sam. Pent. inserts this quote in an earlier verse (Exod 6:9). Another illustration is Gen 31:11–13, where Jacob relates a dream not mentioned in any earlier verses in the MT; in the Sam. Pent., however, the account of this dream is added after 30:36.

The characteristic style of biblical narrative is to relate commands in great detail but their execution only briefly. In the Sam. Pent., however, the execution of such commands is often elaborately narrated by repeating the details of the command. For example, in the first chapters of Exodus God gives Moses and Aaron commands whose execution is briefly mentioned in the MT; the Sam. Pent., however, describes their execution in detail after Exod 7:18, 29; 8:19; 9:5, 19.

(b) Linguistic Corrections. Probably most of the linguistic corrections of the Sam. Pent. were already found in the proto-Samaritan sources (see, e.g., 4QpaleoExm). These corrections pertain to the removal of "unusual" forms (such as *naḥnû,* corrected in Gen 42:11 to *ʾănaḥnû; wĕḥayyat hāʾāreṣ* in Gen 1:24 instead of *wĕḥayĕtô ʾereṣ*), and to the correction of syntactical incongruities such as singular/plural, masculine/feminine (Gen 9:29; 13:6).

(c) Content. It cannot be determined how many of the content variants of the Sam. Pent. were already found in the early sources. Probably most of these variants (which cannot be characterized in any way) were archaic. Among other things, they contain a remarkable number of synonymous variants.

(2) New Elements. (a) Sectarian Changes. The views of the Samaritans differed from those of the Jews in a number of important details, only one of which is known to have been inserted in their biblical text. This concerns the most important doctrinal difference between the Jews and the Samaritans: the central place of worship (Jerusalem for the Jews, Mount Gerizim for the Samaritans). To reinforce this belief the Samaritans added a commandment to the Decalog (after Exod 20:14 and Deut 5:18) that secured the centrality of Mount Gerizim in the cult. This commandment is composed of a series of biblical pericopes that mention such a central cult in Shechem (Deut 11:29a; 27:2b, 3a, 4–7; 11:30 [in this sequence]). The addition of this material as the Tenth Commandment was made possible by changing the First Commandment into an introductory clause.

Closely connected with this addition are various alterations in Deuteronomy where the characteristic expression "the place which the Lord your God *will* choose" is changed to "the place which the Lord your God *has* chosen" (e.g., Deut 12:10, 11). From the Samaritan perspective, Shechem was already the chosen

place in the time of Abraham, whereas from the historical perspective of Deuteronomy, the choice of God's place (Jerusalem) yet lay in the future, after the conquest of the land and the election of David.

(b) Phonological Changes. Some of the phonological features of the Sam. Pent. have been inserted by the Samaritans themselves, as is visible from their agreement with those of the known Samaritan literature. This is true especially of the gutturals, which differ distinctly from those of the MT (see esp. Ben-Hayyim 1956–79; Macuch 1969). Thus in Gen 49:7 the Sam. Pent. reads *weḥebratam* instead of MT's *wĕʿebrātām.*

(3) Orthography. The use of *matres lectionis* (see D.3 below) in the Sam. Pent. differs in several respects from their use in MT. Macuch (1969: 3–9) and Cohen (1976) have shown that it is an oversimplification to say that the orthography of the Sam. Pent. is "fuller" than that of MT: in some word categories MT is fuller than the Sam. Pent., while in other ones the reverse is true. It cannot be determined with certainty how many of these orthographic peculiarities were introduced by the Samaritans, since the proto-Samaritan texts are not consistent in this matter either.

c. Proto-Samaritan Texts. An important group of early texts unearthed at Qumran have been classified as "proto-Samaritan." That name may be somewhat misleading since these particular Qumran mss are neither Samaritan (*pace* Baillet 1971) nor sectarian in any way. This term is used, like in other cases (cf. "proto-Theodotion," "proto-Lucian"), to designate a group of texts, on one of which the Sam. Pent. seems to have been based.

The prominent characteristic which these texts have in common is the occurrence of major harmonizing elements such as evidenced in the Sam. Pent. (see above). There are large harmonizing additions from Deuteronomy in Exodus and Numbers (and in one case, vice versa), well attested in 4QpaleoExm (Sanderson 1986), 4Q158, 4Q364* (both biblical "paraphrases"), 4QNumb* (see Cross 1961: 186), 4QDeutn*, and 4Q175 (Test) [*denotes texts still unpublished].

All these texts form a typologically similar group, related in character yet sometimes different in content. As for differences, the texts (except for 4QpaleoExm) are written in square Hebrew characters. Also, they lack the distinctive phonetic features of the Sam. Pent. As for similarities, they share the Sam. Pent.'s linguistic simplifications, its harmonizations in minor matters, as well as its noncharacteristic readings, although differing in many details in these areas. The spelling of 4QpaleoExm is fuller than that of the Sam. Pent., while that of the other texts is not. They are not sectarian in any way. Moreover, they contain various readings not known from other sources. At the same time, these proto-Samaritan texts share a sufficient amount of significant details with the Sam. Pent. to demonstrate the close relationship with that text. In the same way as the proto-Samaritan texts relate to each other, the Sam. Pent. is akin to all of them, although that text is a bit remote from them because of its subsequent ideological and phonetic developments.

3. The Qumran Texts. In contrast to the two aforementioned groups of witnesses of the biblical text—the (proto-) Masoretic and the (proto-) Samaritan—the texts found at Qumran do not present any one homogeneous group of texts, but a collection of different texts, including proto-Masoretic and proto-Samaritan texts. The texts found at Qumran give an insight into the textual situation in Palestine as a whole from the mid-3d century B.C. until 68 A.D., although it is not known whether the selection and nature of the texts found at Qumran is in any way representative of that period. For overviews of the scrolls and their bearings on OT textual criticism, see Skehan 1971; 1975a; 1975b; Vermes 1977).

a. Background. Many of the Qumran texts discovered in the middle of the 20th century constitute a major source of information for the history of the biblical text, with regard to the history of transmission of the text (see D below), the relation between the biblical witnesses (see C.2 below), and the specific content of the mss themselves. The latter issue is discussed here. (For background information on the Qumran texts, see DEAD SEA SCROLLS.) Many of the texts so far remain unpublished, but all of them have been described and the most important ones have been published either entirely or partially. This makes it possible to obtain a good idea of the importance and relevance of the new sources. (See Fitzmyer 1977 for bibliography, and Skehan (*DBSup* 9: 805–28) and Tov 1988 for full surveys.)

The scope of the documents differs from text to text. The large Isaiah Scroll from Cave 1 (Isa) contains all 66 chapters of the book, but only small fragments of other books have usually been preserved. Separate scrolls are usually identified on the basis of perceived different scripts, but this may be misleading since large scrolls were often written by more than one scribe, so that the total number of scrolls represented by the fragments is smaller than generally assumed.

With the exception of Esther and Nehemiah (but Ezra-Nehemiah form one book), fragments or complete scrolls have been found of all the books of the OT. In addition, fragments of some apocryphal and pseudepigraphal books (in Heb or Aram), which thus far were known only in Gk or other translations, have been unearthed. This situation may be indicative of an open-ended canonical conception, but since the background of the finds of the documents in Qumran has not been clarified, reliable information on the canonical conceptions of the Qumran community can be obtained only from their various sectarian writings.

Based on archaeological considerations, the period of settlement of the Qumran community is from approximately 150 B.C. (or somewhat later) to A.D. 68. However, paleographic analysis suggests that the oldest Qumran texts were written before that time. Presumably the settlers of the Qumran community brought with them some earlier scrolls; furthermore, if scrolls were indeed copied at Qumran, they had to be copied from texts imported from outside. The oldest scrolls are ascribed to the middle and end of the 3d century B.C.: Freedman (1962: 93) attributes 4QExodf to 250 B.C. and Cross (1955) ascribes 4QSam to the second half of the 3d century B.C. and 4QJer^{a} to 200 B.C.

b. Textual Character. The Qumran texts come from 11 caves. Presently it cannot be determined whether the scrolls differ textually from cave to cave. Most of the scrolls whose contents differ from MT (and which thus are important for the reconstruction of the textual history) were found in Caves 4 and 11. This may or may not be coincidental. The biblical text from Qumran is best described in relation to the MT and other sources known before the discoveries in Qumran. The Qumran texts reflect a textual variety, the background of which is not clear (see below).

(1) Most texts from Caves 1, 2, 3, 5, 6, and 8 (and many of Cave 4) are virtually identical with the consonantal framework of the MT, barring occasional variants, especially minor orthographic differences. This group also contains all the paleo-Hebrew texts (except for 1QpaleoLev and 4QpaleoExm). In view of the early date of these scrolls, their text tradition is usually called "proto-Masoretic."

(2) Other texts, though representing the basic tradition of the MT, display a different approach to the text. These scrolls are written in a very special orthography and language, and contain a relatively large number of secondary readings (i.e., readings that eliminate grammatical and contextual difficulties). This orthography and language has not been attested in sources outside the Qumran community (although a few agreements with pronunciations in the Samaritan tradition have been recognized), but this absence of documentation may be due to the paucity of our sources. In the meantime this system of language, orthography, and scribal habits should thus be called the "Qumran system," but the imprecision of this term should be noted. Some of the special features of this "Qumran system" are the spellings *kyʾ, zwt/zwʾt/zʾwt, lwʾ, kwh, mwšh,* and forms such as *mʾwdh/mwʾdh/mwdh;* lengthened independent pronouns such as *hwʾh, hyʾh, ʾtmh;* words serving in the MT as "pausal" verbal forms such as *(w)yqṭwlw;* lengthened future forms such as *ʾqṭwlh;* and lengthened pronominal suffixes for second and third persons plural (e.g., *mlkmh, mlkkmh,* etc.). (For a description of the linguistic background, see Kutscher 1974 and Qimron 1986, and for the distribution of these features in the Qumran scrolls, see Tov 1986; 1988.) These texts also reflect various scribal phenomena not found in other Qumran scrolls, and according to Tov (1986; 1988) they were produced by a Qumran scribal school.

(3) Some texts exhibit great similarity with two non-Masoretic witnesses: the LXX and the Sam. Pent. The sources that are akin to the Sam. Pent. (the so-called "proto-Samaritan" texts) have been described above. Furthermore, 4QJer^{b,d} are closely akin to the LXX, which in Jeremiah reflects a Hebrew text that is one-seventh shorter than the MT and with different arrangement of verses, pericopes, and chapters; in both these respects the LXX resembles the Qumran text. Several other texts, especially 4QSam ^{a}, likewise

contain some or many readings also reflected in the LXX, but none of them is as close to the LXX as 4QJer[b,d].

(4) Several scrolls are "independent" in relation to the MT, LXX, and Sam. Pent. A large scroll such as 11QpaleoLev (see Tov 1979) often agrees with the MT over against other textual witnesses, but it also disagrees with the MT. Likewise, it also agrees often with the LXX, with which it also disagrees (the same also applies to its relation with the Sam. Pent.). At the same time, it contains many independent readings, that is, readings not found in other sources (see D.4 below).

c. The Origin of the Qumran Scrolls. For the evaluation of the textual variety at Qumran and of some of the individual scrolls, one would like to know more about the origin of the Qumran scrolls. In the past most scholars have regarded the Qumran scrolls (both biblical and nonbiblical) as the scrolls of the Qumran sect, implying that these scrolls have been written at Qumran by the scribes of the Qumran community. In these descriptions the collection of scrolls has frequently been portrayed as the "library of Qumran," without the nature of this library ever being appropriately described. Likewise, the discovery in Qumran of what has been called the "scriptorium" has reassured many scholars that the Qumran scrolls were indeed written there. On the other hand, scholars have known that at least the most ancient texts could not have been written at Qumran, since they precede the time of the sect's settlement. This fact, however, has not significantly influenced the account of the scrolls' origin. In any case, the fact that most scholars attributed the Qumran scrolls to the Qumran sect aroused opposition among a few scholars, who, referring mostly to the archaeological finds, denied this claim altogether. These scholars claimed that all of the scrolls found at Qumran were brought there from somewhere else, perhaps from the Temple library (see Rengstorf 1960; Kutscher 1974: 89–95; and Golb 1980). Del Medico (1957) thought that the Qumran caves contained an ancient *genizah* (depository of books) brought from outside.

The aforementioned views were mostly based on the archaeological evidence, while a different view has been proposed by Tov (1986; 1988), based on the distribution of orthography and language in the Qumran scrolls. He noted that the sectarian compositions are written almost exclusively in the Qumran system and that furthermore, no sectarian writings are written in anything but this orthography. These findings led to the conclusion that the Qumran community wrote their own sectarian writings in this special orthography and language, probably at Qumran. Furthermore, all the scrolls written in this system reflect a distinct (Qumran) scribal school recognizable by several scribal habits (the use of scribal marks and of initial-medial letters in final position, and the writing of the divine name in paleo-Hebrew characters). These characteristics are not found in the other scrolls. On the basis of this evidence he suggested that the scrolls written in the "Qumran system" were written by the Qumran community, while the other ones were brought from outside.

4. Additional Hebrew Sources. Mere fragments of passages found in the Bible (some dating as early as the First Temple period) have been preserved. Two small silver scrolls (amulets?) from Keteph Hinnom in Jerusalem, dating from the 7th century B.C., contain (with differences) the priestly blessing (Num 6:24–26). The Nash papyrus from the 1st or 2d century A.D. contains the Decalog according to the text of both Exodus and Deuteronomy. There is also the Severus scroll of the Pentateuch which, according to rabbinic tradition, was brought by the Romans to "the synagogue of Severus" in Rome after the fall of Jerusalem (70 A.D.) and which contains orthographic differences from MT, and the "Pentateuch of Rabbi Meir," quoted by Talmudic traditions as having been copied from the Severus scroll. There were also various texts now lost and mentioned in Talmudic literature, such as Codex Hilleli, Codex Zambuki, and Codex Yerushalmi (see Ginsburg 1897: 410–37).

5. Ancient Versions. a. Text-Critical Use of Versions. The textual criticism of the OT aims at tracing all early attestations of the biblical text. It is not enough to search for such readings in Hebrew sources because non-Hebrew sources, particularly ancient translations (the Versions), also contain many data. These data are used in the text-critical analysis of the OT, but by definition they cannot be used in the language of the translations, since the aim is to discover deviating Hebrew text traditions. The textual critic must thus analyze those portions where the ancient translations deviate from the MT in order to determine whether or not they might reflect original Hebrew variants. Such elements are then retranslated

(retroverted) into the assumed Hebrew-Aramaic original, in order that these retranslated elements, together with extant Hebrew sources, can be used in the text-critical analysis.

Until recently, OT textual criticism has paid much attention to the Versions. This interest was justified because the oldest Heb mss were dated to the Middle Ages while some of the mss of the LXX, Peshitta, and Vulgate date from the 4th and 5th centuries A.D. (some fragmentary papyruses of the LXX go back as far as the 2d century B.C.). This situation has now changed because the Hebrew scrolls from the Judean desert/Dead Sea are not only considerably older than these but often also more important. Therefore text-critical interest will in the future be focused more on Hebrew sources than on the Versions, even though text-critically the LXX will always remain of great importance. The importance of the other Versions for textual criticism is diminishing, although occasionally they contain significant readings. At the same time, these Versions remain important as witnesses to ancient *exegesis.*

Text-critical analysis here reconstructs elements in the Hebrew text—the *Vorlage*—on which the translation may have been based. Scholars are divided about the possibilities and methodology of this procedure. There are no firm, systematic criteria for such a reconstruction of the text, but important aspects of the procedure followed have been described, mainly in reference to the LXX, by Margolis (1907), Goshen-Gottstein (1963), Barr (1968; 1979) and Tov (1978a). These methodological analyses can also be applied to the other Versions.

This analysis is based on the recognized differences between the MT and the various ancient translations. When such a detail differs from the MT one need not immediately assume that its *Vorlage* differed from MT. Such differences are also caused, even in larger measure, by other factors, such as exegesis, translation technique, and corruptions in the transmission of the text of the Versions. Intimate knowledge of these areas is a *conditio sine qua non* for the text-critical use of the Versions. If analysis leads to the conclusion that a particular deviation from MT is not caused by one of the above-mentioned factors, one may assume that the translation is based on a Hebrew consonantal text that differed from the MT.

Often such a text can be reconstructed on the basis of our knowledge of the translation technique and vocabulary, accessible through modern concordances and other tools. The following is a good illustration. The LXX of Deut 31:1 reads, "and Moses finished speaking" *(kai synetelesen Mōusēs lalōn)* instead of MT "and Moses went and spoke" *(wayyēlek mōšeh wayyĕdabbēr).* The deviating translation in the LXX must have been caused by the presence of a variant since no exegesis can be detected in this detail. According to the information presented by the concordances, the Gk verb *synteleō* ("finish") usually represents Heb *klh* ("finish"); thus it may be assumed that here the Heb *Vorlage* of the LXX read *wayyĕkal* instead of *wayyēlek* (i.e., metathesis of the last two consonants). The reconstruction of this variant is supported by an identical variant in a Heb Qumran scroll (1Q5, frag. 13,2) and the similar expression in the MTof Deut 32:45.

Very few elements in the Versions can be retranslated with absolute certainty to specific Heb variants. In general, it is uncertain whether a deviation in a translation is due to a Heb variant or, for example, is the result of a free translation or of exegesis (in choosing from the various possibilities, familiarity with the nature of the translation of the individual books is very important).

But even if it is certain that a detail in the version can be translated back to a particular Heb variant, this does not mean that such a variant reading actually existed in a Heb source; it is possible that the translator misread a detail in his *Vorlage,* so that the variant existed only in his mind. Thus the LXX of 1 Sam 21:8 wrongly calls Doeg *ho Syros,* words that can be retranslated to *haʿărammî,* "the Aramean," instead of *hāʿădōmî,* "the Edomite" in MT (and in other OT references to Doeg). It is impossible to say whether the *Vorlage* of the Gk translation actually read *hʿrmy* or if the translator wrongly read *hʿdmy* as *hʿrmy.* In either case it is customary to say that the LXX reflects a "variant" *hʿrmy,* even though this reading may never have existed in a Hebrew text.

Because of the different approaches in the reconstruction of the *Vorlagen* of the Versions, many divergences in the Versions are retranslated as Heb variants by some, while others regard them as

stemming from translation technique, exegesis, etc. Furthermore, in the retranslation of the divergences into Heb, the possible reconstructions can be numerous.

b. The Septuagint (LXX). The quality of the Greek translation contained in the LXX varies from book to book, ranging from slavishly literal (e.g., Psalms and some early revisions now included in the LXX canon such as the "LXX"of 2 Kings [4 Kingdoms in the LXX] and Ecclesiastes) to loose paraphrases (Isaiah, Proverbs, Esther, Job, Daniel). The analysis of this quality is crucial for the text-critical analysis of the LXX, for it helps us to ascertain whether an individual variation between the MT and the LXX is due to free translation (i.e., an idiosyncrasy of the translator) or to a Heb variant (i.e., an idiosyncrasy of the *Vorlage*).

The LXX reflects a large number of Heb variants in all the books of the OT; in fact, among the Versions, the LXX is by far the most important source for textual criticism. Together with the Qumran scrolls and the Sam. Pent., it constitutes the most important non-Masoretic witness, especially for Exodus, Numbers, Joshua, Samuel, Kings, Jeremiah, and Ezekiel. Particularly important are those sections in which the LXX reflects a text which is *recensionally* different from MT. In such sections the LXX usually represents a stage in the development of a biblical book that preceded the stage reflected in theMT. This holds especially for the LXX of Jeremiah, the shorter LXX version of 1 Samuel 17–18, and the chronological framework of the LXX in 1–2 Kings. (The text-critical use of the LXX in biblical research is discussed in Tov 1981b. For bibliography, see Brock 1973.) See also SEPTUAGINT.

c. Peshitta. The quality of the Peshitta (Syriac translation) varies from book to book, ranging from fairly accurate to paraphrastic. The Heb *Vorlage* of the Peshitta was more or less identical with MT. The Peshitta offers fewer variants than the LXX, but more than the Targums and the Vulgate. (On the text-critical use of the Peshitta, see especially Goshen-Gottstein 1960; Weitzman 1985). See VERSIONS, ANCIENT (SYRIAC VERSIONS).

d. The Targums. The quality of the translation of the Aramaic Targums varies from Targum to Targum and from book to book (see especially Komlosh 1973). As a rule, the Targums from Palestine are more paraphrastic in character than the Babylonian ones. The more literal translations of 11QtgJob and 4QtgLev, though found in Palestine, are an exception to this rule. The relation between the various Targums as well as their origins are elaborately discussed in modern research (Grossfeld 1972–77). See TARGUM, TARGUMIM.

The Targums usually reflect the MT; deviations from it are based mainly on exegetical traditions, not on deviating texts. An exception must be made for 11QtgJob, which contains interesting variants and which possibly lacks some verses of the MT (42:12–17), a fact which would be significant for the literary criticism of the book. It may perhaps be assumed that other Targums in an earlier stage of their development also contained more variants than in their present form. *Targum Onqelos* as a rule contains more variants than the Palestinian Targums. (For a discussion and reconstruction of these variants, see Sperber 1973; Komlosh 1973.)

e. The Vulgate. Though occasionally reflecting variants (see Marks 1956; Nowack 1875; Kedar-Kopfstein 1968; 1969), this Latin translation almost always reproduces MT. See VULGATE.

C. Textual History

1. Introduction. The history of the text (referring mainly to MT) since the 2d century A.D. onward is known in broad lines. But the history of the text before that time is in a sense prehistory about which we can only guess, even though many texts are now known. Theories about the history of the text were current already before the discovery of the Qumran texts, in other words, before one could have an idea of what ancient biblical scrolls looked like and before one knew about the textual multiplicity reflected in the Qumran finds. In many respects these theories are now outdated. Nevertheless, they are discussed here because of their influence on the development of the research and in particular on the terminology used.

2. Relationship between Textual Witnesses. The most important textual witnesses to the OT are MT, with Heb *Vorlage* of the LXX (here simply designated as LXX), "independent" Qumran texts and those written in the "Qumran" orthography and language, the proto-Samaritan sources, and the Sam. Pent. All other sources (such as the Peshitta, Vulgate, Targums, the Heb texts from Naḥal Ḥever, Wâdī Murabba‹at,

Masada, and many Qumran texts) are less significant for the history of the OT text since they are virtually identical with MT.

During the last three centuries the idea has arisen that the MT, the Sam. Pent., and the LXX represent the three main text types for the Pentateuch (the term comes from Kahle 1915: 436, who speaks of *"drei Haupttypen des Pentateuchtextes"*). This view has been greatly influenced by the coincidence that the MT, Sam. Pent., and LXX have been preserved for posterity respectively as the sacred writings of the Jewish, Samaritan, and Christian communities. Another influence was the analogy with the tripartite division of NT and LXX mss. This viewpoint developed gradually (before Kahle, the term "recension" was mainly used; after Kahle, "text type"), but the question was never raised whether these three sources indeed represented different recensions or text types, that is, texts that typologically differ from each other. Only the recent research done in America has tried to define the typological differences among these texts.

The problem with this approach has been expounded by Talmon (*CHB* 1: 159–99) and Tov (1978b; 1982a). According to Tov, the MT, Sam. Pent., and LXX should be regarded as three ancient texts, not as recensions or text types. The complex of relationships among these texts is no different from the relationships among all early textual witnesses. The relationship between the LXX and MT is similar to that of any early source to another one (including recensional differences), but the relationship between the Sam. Pent. and the other two is somewhat more complicated since it (and proto-Samaritan texts) does reflect a number of typologically characteristic peculiarities.

3. Research Before 1947. Various aspects of the history of the text have been discussed by scholars. However, all of these descriptions illustrate only certain aspects of the textual history, and none provides an overall description. In 1915 Kahle gave the first comprehensive description of the textual history of the Hebrew Bible. Prior to that there were only summary remarks and descriptions of the history of the text, of which the two most significant are those of Rosenmüller (1797) and de Lagarde (1863). In 1797 Rosenmüller had maintained that all the MT mss belong to "one recension," which differs from the "recension" of the LXX (at that time the term "recension" was often used in the neutral meaning of "text").

In contrast, the brief theoretical remarks of de Lagarde (1863: 3–4) have until now been of great importance for the reconstruction of the textual history. He believed that all Masoretic mss had certain characteristics in common (especially the *puncta extraordinaria*), so specific that all mss would go back to "a single copy" *(ein einziges Exemplar).* This one copy he also regarded as "one recension" (the "Palestinian recension") that differed from the "Egyptian recension" (LXX), so that terminological confusion was unavoidable. According to de Lagarde, the text from which both recensions derive (the Ur-text) can be reconstructed by way of an eclectic procedure. De Lagarde himself was unable to translate his theoretical arguments into practical applications, but subsequent generations have carried forward this line of argumentation in what became known as the "Ur-text theory." It should be mentioned that in general more has been ascribed to de Lagarde than he himself had postulated. Another source of inaccuracy is the confusion in modern literature between the views of Rosenmüller specifically on the MT and de Lagarde generally on the text of the OT.

Kahle's views were especially influenced by the text traditions differing from the MT that were known in his time: divergent biblical quotations in rabbinic literature, the fragments from the Cairo Geniza, and the various Gk and Aramaic traditions. Guided by these multiple text traditions, Kahle sketched the history of the text as follows. Originally there was not one text of the Hebrew Bible (thus de Lagarde), but a plurality of what Kahle called *Vulgärtexte* ("vulgar" texts). His model for this description was the development of the Aramaic Targums, which, having come into existence as independent translations, were circulated in various forms. This multiplicity of text traditions disappeared during the first two centuries A.D., after the MT (ca. A.D. 100) had been "created" out of the recension of one of the *Vulgärtexte* into an accurate, official text which dislodged all other traditions. In this respect Kahle's description is directly opposed to that of de Lagarde: according to de Lagarde, the history of the text

began with one text which split into various texts, whereas for Kahle the history of the text began with a plurality of text types out of which later one text subsequently emerged.

Kahle was correct in his assessment of some aspects of the textual history of the Hebrew Bible, but on several significant points his views need revision. First, the textual variants on which Kahle's theories are based, like the variants in the rabbinic sources, are of much less significance than Kahle thought they were. Kahle was often impressed by lists of variants, whereas an accurate description of their nature should have led him to other conclusions. Second, the MT was not created in the 1st or 2d century A.D., but it existed already before that time as one of many texts (cf. the proto-Masoretic Qumran scrolls). Third, Kahle's description of the contrast between *Vulgärtexte* and an official text is inaccurate and insufficiently elaborated. (Also, for criticism of Kahle's description of the MT, LXX, and Sam. Pent. as the three "main types" of the text of the Pentateuch, see below.)

Less well known than Kahle's theories are the following analyses, which further developed certain of his insights. A. Sperber (1940) further elaborated the difference between one official biblical text and many *Vulgärtexte*. He described especially the nature of these vulgar texts, in which group he also included the Sam. Pent. and the MT of Chronicles. On the analogy of the development of the Homeric writings, S. Lieberman (1962: 20–27) introduced a qualitative distinction between three kinds of mss: *phaulōtera,* "poor copies," in the possesion of unschooled villagers; *koinōtera,* or *vulgata,* the "generally accepted text," in the possession of city people, used especially for study purposes (e.g., in schools); and *ēkribōmena,* "accurate copies," in the possession of people connected with the temple. Building on Lieberman, Greenberg (1956) suggested that at the time of the Hasmoneans two text types were in circulation: the fuller, unofficial type (such as the Sam. Pent.) and the shorter, official type (the MT).

Beginning with the 1950s, a new approach to the history of the text became current in American biblical scholarship. A theory of "local recensions/text types/families" was set forth in broad lines by Albright (1955) and worked out by Cross (1975a; 1975b). This theory reduces the multiplicity of textual witnesses to three text types: one current in Palestine (inter alia, the Sam. Pent., the MT of Chronicles, several Qumran scrolls), one in Babylonia (the MT), and one in Egypt (the LXX). These text types can be described in general terms; for instance, "the Palestinian family is characterized by conflation, glosses, synoptic additions, and other evidences of intense scribal activity, and can be defined as 'expansionistic' " (Cross 1975a: 283). The characteristics of the Babylonian and Egyptian text types are described in the same general way.

This theory has its critics (Talmon, *CHB* 1: 193–98; Tov 1982a). One of its weaknesses is the lack of evidence supporting the description of the characteristics. Moreover, the terminology needs closer definition (see Gooding 1976). The Qumran scrolls show that the boundaries between the three groups are not always clear. For example, how can one explain the close relationship between 4QJer ^{b,d} (found in Palestine) and the *Vorlage* of the LXX (Egypt)? How can it be determined that MT is Babylonian and that (not only the translation but also) the *Vorlage* of the LXX is Egyptian? Serious questions are also raised by the fact that scrolls of all three supposed text types were found side by side at Qumran. Notwithstanding these objections, a central feature of the theory of local text traditions can be evaluated positively—there were undoubtedly geographical and social differences among the various text traditions. Only such an assumption can explain how altogether different forms of the text, in particular recensional differences (see F below), have been preserved, even after the MT had become the only text to be used by the central group in Judaism. At the same time, it is not possible to make precise statements about the nature of these local traditions.

4. More Recent Research. The description of the textual history is necessarily brief, because our knowledge on this subject is very limited. Each of the descriptions and theories described in the previous paragraphs refers to merely one aspect, and all of them are usually very dogmatic. There is no single "textual theory" which explains all aspects of the textual development, so that we will have to content ourselves with partial descriptions of limited phenomena.

The first question arising is the chronological framework for the description. It is relatively easy to recognize the end of the 1st century A.D. as the limit of the period of textual development, since the

biblical text did not change much after that period. At that time the texts were well fixed in their respective socioreligious environments, and they did not continue to develop anymore. On the other hand, the beginning of the period of textual development is not well demarcated. It would have been natural to assume that the textual development started upon the completion of the literary compositions, since from that time onward they were frequently copied. However, as noted below (see F), limited copying began even before that time.

In the OT itself there is some evidence that portions of books were written prior to the completion of the full literary unit. Also, editing and revisional activity, as evidenced in most of the biblical books, took place on the basis of previously written compositions. The editors-revisers of the biblical books thus served as both authors and copyists. This applies also to the author of the book of Chronicles.

At a certain point the literary unit was completed, but this process could be repeated several times: sometimes a certain readership accepted a form of the book which at the time was considered final, and it was distributed as such on a limited scale. However, at a later point someone else could prepare a "revised" edition intended to replace the previous one. That edition was also accepted by some in due course, but it could not totally replace its forerunner, which remained in use in places that were remote either sociologically or geographically. In this way the earlier editions were available to the LXX translators in Egypt as well as to those who deposited 4QJer ^{b,d} in the Qumran caves.

Independent of the procedure of copying, each of the biblical books at a given moment received an authoritative (canonical) status. This process had much impact on the copying and transmission procedures of the biblical text.

The finalized literary product which incorporated the last recognizable literary editing of the book should be considered the "Ur-text" (archetypal copy) of the biblical books, elements of which textual criticism attempts to reconstruct. This formulation, which necessarily remains conjectural, thus agrees with the views of de Lagarde, though not in all details.

The period of textual unity reflected in the copies which we named the "Ur-text" was short, and possibly never existed, since at the same time there also circulated additional copies of the biblical books incorporating remnants of previous literary stages. This relative textual unity was disturbed in the next generations, when copyists inserted changes in the text in different quantities. This textual diversity was also created by the changes pertaining to the biblical text in spelling, the writing of final letters, and probably also the dissolution of the *scriptio continua.* An abundance of textual errors likewise disturbed the initial textual unity.

Many copyists took liberty to insert changes in the text, and in this way they continued the approach of the last layer of composing and editing the biblical books. Some scholars even speak of a transitional stage of composition-copying. Even though many of these changes pertain to matters of content, a qualitative and quantitative distinction should be made between the intervention of the authors-editors prior to the authoritative status of the biblical books and that of the later copyists, who allowed themselves less freedom than their predecessors.

From the outset all copyists may have approached the text freely, but possibly already then there were copyists who consciously refrained from inserting changes in the text. In any event, the earliest available textual evidence, the proto-Masoretic texts from Qumran dating from the 3d century B.C., already displays such an approach. It is hard to know whether these texts represent an approach of earlier generations or a secondary stage; in any event, even these texts at times reflect scribal intervention of some kind.

The available textual evidence does not enable any precision in dating, but the Qumran finds allow for some statements on the last three centuries B.C. until 68 A.D. In that period we note different textual developments in the various biblical books—if the evidence does not distort the picture—and the various groups in Judaism approached the biblical text differently. The Qumran finds show that this period is characterized by textual variety. The views of Kahle (see C.3 above) referred to a situation like this, with one major difference: in his description the textual variety existed in the initial stage of the textual development, while according to our analysis it was created at a second stage.

Textual variety was characteristic of Palestine as a whole, but apparently in temple circles only one text or group of texts was used, namely the proto-Masoretic texts. The Qumran finds show the different texts which were current in Palestine in the Second Temple period: the texts written in the "Qumran" orthography, proto-Masoretic and proto-Samaritan texts, scrolls closely related to the LXX (4QJer ^{b,d}), and texts that are not related to any of the above. Because of the latter group of texts, the number of the texts current in Palestine was virtually unlimited.

This textual variety has been described in the past in terms of closeness to sources known before the Qumran finds. This way of describing the scrolls reflects a custom that resulted from the accidental situation that for centuries scholars were aware of the LXX and the medieval mss of the MT and the Sam. Pent., but not of earlier texts. Because of this unusual situation, scholars were accustomed to describing the data in a reverse order. This irregularity can now be corrected, enabling one to understand how the medieval MT developed from the earlier proto-Masoretic texts and how the Sam. Pent. was based on one of the so-called proto-Masoretic texts.

The textual variety characterizing the biblical books as a whole did not exist for all of them to the same extent. This resulted from the accidental nature of the textual transmission: scribes inserted their changes (expansions, omissions, orthography, etc.)—inconsistently—in some of the biblical books only, so that a certain textual development known from one biblical book should not necessarily have existed in all of the books.

Within this textual variety we note two different approaches to the biblical text, which gave rise to both "vulgar" texts (in use by the public at large) and all the other, "nonvulgar" texts. The latter were conservative in nature, and they were created and used by specific groups. The present evidence does not allow for a distinction between three groups, as suggested by Lieberman (1962), even though the assumption itself is logical. It is hard to know in which circles the different texts were created and used. Probably the vulgar texts were never used for liturgical purposes, but this cannot be ascertained for the Qumran sect. Between the nonvulgar texts, the proto-Masoretic texts stand out since they had a special, possibly exclusive, status in the central group of Judaism.

Vulgar texts are known from different places in Palestine. Their copyists took liberty to insert in them all kinds of changes and corrections as well as to innovate the spelling, often drastically, as witnessed in many of the Qumran scrolls. Typical representatives of this group are the texts produced by the Qumran school of scribes. These texts are usually written carelessly, and they contain many corrections and erasures. From a textual point of view their secondary nature is visible in the changes in orthography and language as well as in contextual changes. Apparently also the Severus scroll and the "Pentateuch of Rabbi Meir" contained a similar crop of secondary readings, especially in phonetic details. To this group belong also the proto-Samaritan texts and the Sam. Pent. The latter texts are not written carelessly, and their spelling does not resemble that of the Qumran school of scribes, but their scribes allowed themselves much freedom in editorial interventions. The harmonizing additions as well as the linguistic and contextual corrections are clearly secondary, a feature which characterizes the vulgar texts as well.

The so-called vulgar texts contain many secondary readings in comparison with the nonvulgar texts, but at the same time they also contain some readings which are preferable to the ones in the MT and other nonvulgar texts. Such readings simply happened to be preserved in vulgar sources.

The nonvulgar texts can also be named "precise" or "conservative," but these terms may be misleading since these texts differ from each other. These internal differences reflect the textual diversity in the Second Temple period, and all of them reflect elements of the so-called original text which have been changed in the other texts. It is hard to say which text is closer to the so-called Ur-text; if a personal impression may be allowed here, it seems that often the LXX is closer to that text than the MT.

Of the nonvulgar texts one is best acquainted with the proto-Masoretic texts, from which the MT developed in the Middle Ages. However, in spite of the great care taken in the copying of these texts, they too were corrected (see the emendations of the scribes and other corrections mentioned in D.4.b below) and they too were corrupted from time to time; see especially the text of Samuel. Another such text is the

LXX. In one case the *Vorlage* of one of its books has been preserved coincidentally in a Qumran scroll (4QJer^{b}).

The vulgar and nonvulgar texts described here were current in Palestine in the last three centuries B.C. and in the first two centuries A.D. The coincidental nature of the preserved textual sources does not enable us to know which sort of text was more frequent. However, if the Qumran scrolls display a trustworthy picture, it appears that from the 3d century B.C. onward, proto-Masoretic texts were more frequent than the other ones. This situation derives from the strength and influence of the central stream of Judaism, through whose influence these texts were copied and distributed. It is not clear whether beyond the mere copying there was a conscious effort of unifying the texts which would have reduced the number of internal differences. Such a presumed procedure could have been learned from the story about the three scrolls found in the Azarah (see *j. Taʿan.* 4:2, 68a [cf. Talmon 1962]).

After several centuries of textual diversity we note a period of textual unity at the end of the first century A.D. caused not by intrinsic factors related to the textual transmission, but by political and socioreligious events and developments. By the end of the 1st century A.D. the LXX had been accepted by Christianity and abandoned by the Jews. Copies of Sam. Pent. were available, but in the meantime that sect had become an independent religion, so that their texts were considered Samaritan, not Jewish anymore. The Qumran sect, which had preserved a multitude of texts, did not exist after the destruction of the temple. Therefore the sole texts that existed in this period were the ones that were copied and distributed by the central group in Judaism. For example, the texts from the Bar-Kokhba period found at Naḥal Ḥever and Wâdī Murabbaʿat contain solely the MT. This situation gave rise to the wrong conclusion that the MT had "ousted" the other texts, but such a description reminds one of a cultural struggle of modern times and not of the real background, viz. the political and socioreligious factors at work in this period (cf. Albrektson 1978).

It should be remembered that all descriptions such as the preceding depend on the accidental nature of the textual evidence. Even the nature of the books in the MT and LXX has been determined to a great extent by coincidence. The situation that 1–2 Samuel in the MT is relatively corrupt derives from the fact that such a copy has been included in the archetype of the MT, and not from the approach of the scribes to that book or from its textual vicissitudes. Likewise, the discovery of textually important data in some of the books of the LXX and scrolls such as 4QJer^{b} may be coincidental, so that similar developments may have taken place in other books as well.

D. Copying and Transmission of the Text

Many external facts are now known about the copying and transmission of the text from one generation to the next. These data are interesting in their own right, but they also help us to understand the background of certain textual mishaps.

1. Sources of Information. The texts from the Judean desert (mid-3d century B.C. to beginning 2d century A.D.) provide an excellent picture of a cross-section of the biblical texts on the basis of which the copying and transmission of the texts through the centuries can now be portrayed. Since some of these texts were written in Qumran and others in different places in Palestine, the copying conventions evident in the Qumran scrolls are generally accepted as representative of what was customary at that time.

The post-Talmudic tractate *Sopherim* (ed. M. Higger [New York 1937; repr. Jerusalem 1970]), which gives detailed instructions for writing biblical scrolls according to the Halakah, provides further information on this process. Many of the instructions in this tractate represent old traditions, so that the material can be used in spite of its 9th-century date. In the following some of the central details in that copying and transmission are recorded.

2. Outward Form. For many centuries the biblical books were written on scrolls (Hebrew *mĕgillâ,* pl. *mĕgillôt*), composed of individual sheets of leather (vellum) and at an earlier, undocumented stage, of papyrus. This is amply illustrated by the documents from the Judean desert (for the later periods, see the documents collected by Sirat 1985). Only in the post-Talmudic period did the codex, introduced by the Christians for their holy writings, also come to be used for the Hebrew Scriptures. Even today scrolls are still used in the synagogue for the reading of parts of the Bible.

Each scroll contained one biblical book, but a few Qumran scrolls contained more than one pentateuchal book and the Minor Prophets scroll from Wâdī Murabba‹at encompassed all the Minor Prophets. Some scrolls contained mere selections: 4QDeutq probably contained only Deuteronomy 32, and likewise some of the psalm scrolls contained a mere choice of psalms.

The text in the scrolls was written in columns, whose size varied from one scroll to the next. Some texts were more consistent regarding the column size than others, but within each individual sheet usually a consistent pattern was followed (for details see Tov 1988). These columns were usually lined and the letters were written beneath the lines. Most scrolls contained columns of approximately 20 lines, with exceptions on either side. For example, most of the scrolls containing one of the Five Scrolls had very small columns (7–13 lines). The script in which the Bible was originally written (the [paleo-] Hebrew script) was developed from the Canaanite script. Even when this script was no longer used, and new texts were written in the so-called Aramaic or square script, some of the pentateuchal scrolls could still be written in the old script. This is also the case with one Qumran scroll of Job and some as-yet-unidentified texts from Qumran and Masada. The transition from the Hebrew script to the square script took place in the 5th century B.C. (tradition ascribes this change to Ezra).

Two formal features of scrolls, attested in the Qumran scrolls, are also reflected in some way or another in the later MT: (1) The text is divided into sense units (paragraphs, sections). Not only is the system used in most Qumran scrolls similar to that of the MT, but the two also agree to a great extent with regard to the position of the paragraphs. (2) Scribal marks are used to indicate letters to be erased, corrections made, and other matters which are not always clear (see 1QIsa).

Certain formal features of the printed MT were not part of the older scribal practices: (1) In the ancient biblical scrolls the words presumably were not separated by spaces—they were written in the so-called *scriptio continua,* as can still be seen in the later tefillin and mezuzahs from Qumran and Masada. However, no such biblical texts have been preserved, and the main argument for the assumption of *scriptio continua* is that later texts often resolve word divisions wrongly. All Qumran texts use spaces between the words, and in a few exceptional cases dot dividers are used. (2) The scrolls from the desert of Judea contain neither vocalization nor accents. (3) The division into verses and chapters in the Hebrew mss was not made until the Middle Ages. (4) The letters *m, n, s, p,* and *k* have two forms in the Aramaic script, one of which is used at the end of a word. Several Qumran scrolls represent a transitional stage in which both forms of the letter are often used interchangeably (initial-medial forms of the letters sometimes are used in the final position).

The Qumran scrolls clarify various aspects of the procedure of copying (see especially Martin 1958) which also explains various types of errors: (1) The graphic similarity between several single letters or combinations of letters—ligatures—explains mistakes made with consonants. (2) The correction habits (adding elements between the lines or in the margin, crossing out, erasing, placing dots above or under the letters) created cramped and crowded texts which facilitated misunderstandings and misreadings. (3) The published scrolls contain extremely few examples of glosses, so often appealed to in biblical scholarship. If these were ever used, they must have been created at an earlier stage of the textual transmission.

3. *Matres Lectionis.* *Matres lectionis* (literally, "mothers of reading") are the letters *›alep, he, waw,* and *yod* added to the basic forms of Hebrew words to facilitate their reading. In principle the *matres lectionis* thus serve a function that in the MT was later taken over by the vocalization.

The textual witnesses differ considerably in their use of *matres lectionis,* and individual witnesses are not always internally consistent. This situation is the result of the development of Hebrew orthography. At first Hebrew did not use *matres lectionis,* but later these were added in several places to the basic form of the words: *yod* for "i" and "e," *waw* for "u" and "o," and *›alep* for "a," "i," "e," and "o" (see Cross and Freedman 1952). The increasing use of *matres lectionis* is reflected in the various kinds of biblical texts; older texts make less use of them than more recent ones.

Spellings without a *mater lectionis* are called "defective"; those with a *mater* are called "full" *(plene).* The orthography of the MT to a certain degree exhibits defective spelling, therefore the last copying stage represented in the MT reflects a relatively early stage of the evolution of the biblical text (between the 4th

and 2d centuries B.C., according to Freedman 1962). However, it is wrong to generalize about the books of the MT, since every book is different (see especially Andersen and Forbes 1986). The later biblical books (Song of Songs, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, Chronicles) reflect a fuller orthography than the earlier ones (e.g., the spelling of the name David as *dwd* in Samuel and Kings, but *dwyd* in Chronicles). Among the earlier books, the Pentateuch (esp. Exodus and Leviticus) and Kings present the most conservative system of spelling. Within individual books different spellings are found side by side (e.g., Ezek 32:23 *kbrtyh*, v 25 *kbrth*, v 26 *kbrwtyh*). (For examples of the inconsistencies in the Masoretic spelling, see especially Sperber 1966: 556–74; Barr 1989.) On the other hand, beyond the characteristics of each book, certain words consistently reflect an established spelling *(nʾm, ybʾ, ʾbwt).*

4. The Background of Textual Variations. There are literally thousands of differences regarding spelling, vocalization, verse division, etc., between parallel texts within the MT, within the early biblical texts (proto-MT compared with the Qumran scrolls and the proto-Samaritan texts), and within the later mss of the MT. Usually all these different readings are compared with the MT and deviations from the MT are called "variants," without any pejorative implication that they are intrinsically inferior. A distinction is made between unintentional variants created in the course of the copying of the text and other variants, some of which reflect intentional alterations (while still others reflect a shifting linguistic reality).

a. Unintentional Variants. Unintentional variants (for the most part mistakes) crept into the text for various reasons connected with the copying of texts: the transition from the Hebrew to the Aramaic script, the interpretation of the *scriptio continua* when the words were finally separated, the misunderstanding and interchange of letters and words by the copyists, and finally various types of oversight by the copyists. In simple terms, all variants are either different words (sometimes resulting merely from one different consonant), omissions or additions of details, or transpositions of elements. Among these, the following phenomena should be mentioned separately:

The confusion of consonants. Errors result from the fact that some consonants closely resemble others, especially *t/ʾ* and *y/ṣ* in the Hebrew script, *y/w*, *b/m/k* in the square (Aramaic) script, and *d/r* in both. Also, ligatures such as *nw* could be confused with final *m*, and *ʿy* or *ʿw* could be confused with *š*. This confusion is recognizable not only between different mss of the same text, but even within parallel texts in the MT itself (e.g., Gen 10:4 Dodanim = 1 Chr 1:7 Rodanim; Gen 10:3 Riphat = 1 Chr 1:3 Diphat).

Dittography. Errors could result from the erroneous repetition of letters or words (e.g., Jer 51:3 *ydrk ydrk;* cf. the Qere, *ydrk*).

Haplography. Errors could also stem from the skipping of one or two (almost) identical letters or words (e.g., the erroneous omission of *bṭwḥ* in Isa 26:3 in 1QIs^{a} before *bṭḥw* in v 4; the correct reading is found in the MT).

Homoeoteleuton. Similarly, errors crept in due to the erroneous omission of a group of words with the same ending, caused when the eye of the copyist jumped directly from one word (or group of words) to another, identical word (or group) later in the text (e.g., the omission of Isa 40:7b–8a in 1QIs^{a}; in this case the omitted text was subsequently reinserted at the end of the line, above the line and in the margin).

Metathesis. Errors could also result from the transposition of letters (e.g., 2 Sam 23:31 *hbrḥmy*, the Barhumite = 1 Chr 11:33 *hbḥrwmy*, the Baharumite). On the basis of parallel texts, the latter reading can be established as the correct name of the city (Bahurim).

Doublet (conflate reading). The mistaken juxtaposition of two or more parallel readings in the text itself, with or without grammatical connection, could lead to erroneous readings (see the textual witnesses in Isa 37:9; 41:20; Jer 52:34 = 2 Kgs 25:30). See Talmon 1960.

Different word division. Some differences between two textual traditions derive from the time when the words were resolved from the *scriptio continua* (cf. the Kethib and Qere forms in 2 Sam 5:2; Ezek 42:9; Job 38:12).

Many examples of these scribal phenomena have been collected by Sperber (1966: 476–90) and Delitzsch (1920) from different mss of one text, from the MT compared with the Sam. Pent., from the Kethib words compared with the Qere forms, and from inner-Masoretic parallel texts.

b. Other Variants. While many of the variants in biblical mss were created by unconscious scribal procedures such as described above, other readings were intentionally inserted into the text. Of these, there is a large group of linguistically different forms indicating that the linguistic reality of the copyist was different from that of the original text and that the text was changed accordingly. This is visible especially in the Sam. Pent. and the Qumran scribal school, as well as in the text of Chronicles when compared with the earlier books. In this latter case, the author of Chronicles allowed himself the linguistic changes which were also made by copyists. Relevant examples for 1QIs[a] are the change of the rare *yhlw* to *yʾyrw* in 13:10 and of the hapax *šwbl* to *šwlyk* in 47:2.

More penetrating changes concerned the content of the text, especially in the realm of theology. The Sam. Pent. and the LXX (possibly independently) record in Gen 2:2 that God stopped his work on the *sixth* day (and not on the *seventh* day as in the MT), thus removing a theological problem from the text. The "corrections of the scribes" (see above) show that this procedure must have continued until relatively late periods. Changes of this kind have often been recognized within the MT itself (see Ginsburg 1897: 399–404) in the tendency of Samuel to alter the component "Baal" in personal names. Thus Gideon's second name, Jerubbaal, occurs 14 times in Judges and in 1 Sam 12:11, but was changed to "Jerubbosheth" in the MT of 2 Sam 11:21, where the LXX still has the old form "Jerubbaal." The name of Saul's fourth son was twice written "Eshbaal" in 1 Chronicles, but in 2 Samuel it was changed 12 times to "Ishbosheth."

E. The Procedure of Textual Criticism

1. Introduction. OT textual criticism covers two areas. The first, the analysis of the biblical text as found in Hebrew mss and as reflected in the ancient versions, may be called textual criticism proper, while the second area, conjectural criticism, is to be regarded as an appendix to textual criticism (see E.4 below). The task of textual criticism proper is further subdivided into two stages, the first involving the collation (collection) of existing Hebrew variants and the reconstruction of other variants from the ancient translations, and the second dealing with the evaluation of these variants.

2. Collation and Conjectural Reconstruction of Hebrew Variants. The evaluation of the textual witnesses can begin only after all the relevant data have been collected. For this purpose, variants have been collected and described in various kinds of monographs. Most of the information on these variants is found in monographs which are devoted solely to this issue, but much information can also be found in special apparatuses in ICC and BKAT.

In addition, one often turns to a modern critical edition of the Hebrew Bible that contains a selection of these variants. The modern editions are *BHK*, BHS, and the still incomplete *HUB* (see M. H. Goshen-Gottstein, *The Hebrew University Bible: The Book of Isaiah I–II,* Jerusalem, 1975–81). These critical editions reflect a mixture of objective and subjective factors, the latter manifested in the idiosyncratic process of selecting which data to incorporate and how to present them. Thus, *BHK* and *BHS* merely provide a selection of textual data and are often inaccurate. Much important data is excluded and much that is insignificant has been included; especially the treatment of the Versions leaves much to be desired (*BHS* is often more careful in its judgments than *BHK,* but on the other hand the selection of *BHK* often provides a better basis for further study than *BHS*). (For a critical evaluation of *BHK*, see especially Orlinsky 1961.)

The *HUB* avoids conjectures (emendations) and its selection of data is much more complete than *BHK* or *BHS*. In four different apparatuses this (still incomplete) edition simply includes variants (a) from the Versions; (b) from the rabbinic literature and the scrolls from the Judean desert; (c) of consonants from medieval mss; and (d) of vocalization and accentuation from those mss.

3. Evaluation of Readings. After all the variants are collected from the Heb sources and reconstructed from the Versions, they must be evaluated. This evaluation is performed through comparison with the textus receptus (MT), without implying that the MT is the best text. In fact, all Heb readings in principle are of equal value and this applies also to reconstructed variants, provided the reconstruction is trustworthy.

The purpose of this comparison is to determine whether one of the transmitted readings can make a better claim of representing the "original" text (as defined in the introduction above) than the others. Because of the lack of convincing arguments, such a determination is often impossible. In some cases two variant readings are regarded as "synonymous" (see Talmon 1961), and in yet other cases the evidence for deciding the "original reading" is insufficient. However, the inability to decide in such instances does not undermine the correctness of the procedure itself.

The readings are compared on the basis of their intrinsic value. This analysis is based on subjective considerations that are used as a guide to evaluate the reading "in its context" when that "context" is taken in the broadest sense of the word. Thus, a discussion of the "context" of a given Heb word leads to a complete exegesis of the passage as well as to an analysis of the language and style of the OT as a whole and the specific scriptural unit under investigation. Ideally one tries to determine the one reading from which all the other(s) would have derived, or the reading which best explains the direction in which the other readings developed. That reading is considered the "best" or "original" reading.

In view of the subjectivity of the evaluation of the readings, some have tried to draw up rules, external (relating to the textual witnesses) and internal (relating to the intrinsic value of the reading) that would seemingly make this evaluation more objective (see, e.g., Klein 1974: 69–84; Payne 1974; Thompson, *IDBSup*, 886–91; Barthélemy et al. 1979; for an analysis of the earlier discussions see Tov 1982b). *Internal rules* pertain to such issues as preferring the shorter reading *(lectio brevior)* to a longer one, and a "more difficult" reading *(lectio difficilior)* to easier ones. But these internal rules are abstractly formulated, they apply only to a small number of instances, and their use is so subjectively determined that the evaluation still remains a subjective procedure (see Albrektson 1981; Tov 1982b). *External rules* refer to such matters as the relative and absolute date of the textual witnesses, their geographical backgrounds, the weight given to the testimony of the majority, and the preference of MT, but all these criteria are fraught with assumptions and do little to eliminate the subjective aspect of the enterprise. Common sense coupled with the occasional use of an internal rule remains our main guide.

4. Conjectures. Conjectural criticism (emendation) concerns itself with the correction of the biblical text, utilized when neither the Hebrew mss nor the ancient translations offer a "satisfactory" reading of the "original" text in a given instance. The coincidental nature of the textual data preserved justifies judicious emendation: since only a (small?) fraction of the textual witnesses have been preserved, it is possible to appeal to the unpreserved remainder by way of conjecture, basing this on known textual procedures such as interchanges of similar letters. Conjectural criticism is one of the most subjective parts of biblical study because there are no objective criteria for determining the incorrectness of the transmitted readings or for suggesting conjectures. Conjectural criticism actually stems mainly from exegesis and is only secondarily linked to text-critical criteria, for conjectures are initially proposed on the basis of what the critic feels the text "ought" to say, and only subsequently must they be acceptable on the text-critical level. Most conjectures derive from a certain understanding of the context, but some are based on linguistic presuppositions concerning biblical Hebrew, cognate languages (especially Ugaritic), and on metrical considerations. Most of these linguistic conjectures are questionable (for criticisms on grammatical conjectures, see Sperber 1966: 49–104).

A well-known example of a contextual conjecture is in Amos 6:12 where, instead of MT *ʾim yaḥărôš babbĕqārîm* ("does one plow in the mornings" [?]), Michaelis in 1772 emended it to read *ʾim yeḥārēš bebāqār yām* ("does one plow the sea with oxen" [lit. "is the sea plowed by oxen"]). The MT is unintelligible without the conjecture (accepted by RSV), which makes perfect sense and creates better parallelism than the MT, even though it is not supported by a single manuscript.

Various editions (especially *BHK* and *BHS*) and commentaries include conjectures, and given the inherent subjectivity involved it is not surprising that these have generated much criticism.

F. Textual and Literary Criticism

The biblical books each developed to the stage at which they were considered finished literary products, and textual criticism concerns itself with charting developments from that point on. The reconstruction of all developments prior to that point is the concern of literary criticism. However, since some form of

written transmission must have occurred during the stage of the literary growth, sharp distinctions between the two cannot always be drawn. Much can be inferred from the way in which late biblical revisions were based on earlier texts; also the story in Jeremiah 36 suggests that *portions* of what would later be incorporated in a biblical book were written and circulated prior to the completion of the complete literary product we now possess.

Scholars have pointed out that some of these earlier (partial) formulations of the biblical books have been preserved in the textual witnesses. These remnants of earlier literary stages (preceding the one reflected in MT) are thus relevant to *literary* rather than to *textual* criticism since they pertain to the literary growth and not to the textual transmission of the book in question. Most of the evidence relates to data preserved in the LXX and in two of the Qumran scrolls, in both cases textual witnesses which because of their physical and/or religious remoteness from mainstream Judaism were used at a time when the MT prevailed elsewhere. The examples have been collected by Tov (1981b: 293–311). For example, the MT of Isa 38:21–22 witnesses to a later stage in the development of the story of Hezekiah's sickness, as is evident from 1QIs[a] and the parallel in 2 Kings 20, which attest to an earlier stage (see Zakovitch 1985). The LXX of Jeremiah and 4QJer[b] attest to an earlier editorial stage of the book, differing from the later edition (attested by MT) both in length and in sequence of verses and chapters (see Tov 1981a). The short text of the LXX of Josh 20:1–6 reflects an earlier and shorter stage of the law on the cities of refuge than the MT, which witnesses to a subsequent editorial stage wherein the law was reformulated with respect to Deuteronomy 19 (see Rofé 1983). Likewise, the much shorter text of the story of David and Goliath in the LXX reflects an earlier stage of that story than does the MT (see Lust and Tov in Barthélemy et al. 1986). According to Tov (1981b: 307–11), this sort of textual evidence should not be evaluated with the usual text-critical procedures.

EMANUEL TOV

NEW TESTAMENT

NT textual criticism is the study of the transmission of the NT texts from their presumed autographs through all of their ms representations. Though its primary objective is to reconstruct the original or earliest form of the text of the NT books, it is concerned also with intermediate and larger forms of the text and, indeed, with all aspects of textual transmission and its history, including localized or geographically limited forms of the text, and ideologically or theologically biased textual formulation. While NT textual criticism has its "scientific" or empirical and objective aspects, including statistical analyses and quantitative measures, it is also very much an "art," requiring subjective judgments and qualitative decisions based on expert knowledge of the general textual transmission process and on experience with textual variation and scribal habits in particular. NT textual criticism, then, is the science and art that assesses the transmission of the NT text and identifies its alterations and distortions.

Textual criticism is "lower criticism," the establishment of the text of a document as closely as possible to the autograph or the author's original writing. This is distinguished from "higher criticism," the assessment of a document's philological, historical, literary, cultural, and ideological characteristics, as well as its interpretation and meaning.

A. Definitions

1. Textual Reading/Textual Variant. The textual variant or, in more recent years, the variation unit (see below) provides the focal point for NT textual criticism. Yet not every textual "reading" that varies from any other reading in the same unit of text is a textual "variant." Only variant readings that are "significant" variants are considered "textual variants." Each of these terms requires careful definition (see Epp 1976b).

a. Reading. The term "reading" is the broadest and most general term, referring to any textual difference or any varying text formulation in a ms found by comparison with the same passage in any other ms. Any such textual divergence is always a "reading" before it is anything else. It may, in fact, remain a "reading" permanently or, depending on its nature, may be designated a "variant."

b. Significant/insignificant Readings. A reading is either a significant reading or an insignificant reading. "Significant" means meaningful or useful for the major tasks of NT textual criticism, including the determination of ms relationships, the location of a ms within the textual history of the NT, and the establishment of the most likely original text. Naturally, an "insignificant" reading is one that is inappropriate, inadequate, or inconclusive for these goals of textual criticism, though no reading can automatically, finally, or absolutely be described as insignificant. For example, readings not useful in establishing a ms's relationship to other mss may nonetheless aid in understanding its own nature and the characteristics of its scribe(s). Hence, the edition of any ms should display and analyze all of its readings prior to separating the significant ones from the insignificant. In addition, readings may become significant readings when new mss are discovered or upon the availability of collations of mss previously unexamined. This complicates the task of collecting and recording data and makes imperative, e.g., the *full* collation of every NT ms so that all of its readings can be examined as the need arises.

An *insignificant reading* may be classified in one of four ways and should not be called a "variant": (1) A *nonsense reading* is one that fails to make sense because it cannot be construed grammatically or because it lacks a recognizable meaning in some other way. Authors and scribes do not produce nonsense intentionally, so it is assumed (a) that nonsense readings resulted from errors in transmission; (b) that they, therefore, cannot represent either the original text or the intended text of any ms or alert scribe; and (c) that they do not aid in the process of determining ms relationships.

(2) A *clearly demonstrable scribal error* (other than a nonsense reading) is a reading that can be construed grammatically and makes sense but can be demonstrated with reasonable certainty to be a scribal error. Unintentional scribal errors are described below, but notable are certain instances of haplography and dittography; harmonization with similar contexts; errors of hearing that produce a similar-sounding word; and metathesis. Naturally, it is difficult to determine in many cases whether a variant is a "clearly demonstrable" error or an intended reading, and any reading that makes sense should not lightly be placed in the "insignificant" category. Yet, in the case of many readings a reasonable argument can be made that the result has arisen, for example, from harmonization or from haplography due to homoeoteleuton—a common error both in antiquity and in our own everyday experience that eliminates several letters or words or a lengthy passage as the eye jumps from a certain word ending or line ending to a similar ending farther along in the ms.

(3) With one notable exception, mere *orthographic differences* between readings render those readings insignificant for text-critical purposes. The most common orthographic differences involve itacisms (the

accidental confusion of seven vowels or diphthongs which had a similar pronunciation) and the *nu*-movable (presence/absence of the letter *nu* at the end of certain Greek forms), as well as varying formulations of abbreviations. None of these phenomena contributes decisively to the establishment of ms relationships, and "correct" spelling is not a material issue in reconstructing the original text as long as no ambiguity in meaning attends the alternative spelling formulations. The exception to the insignificance of orthographic changes comes in the spelling of proper names; these need to be retained in the critical apparatus among the "significant" data for textual criticism because some classic text-critical and historical problems turn on the forms of names for persons or places.

(4) Finally, a *singular reading*—a reading found in one NT ms but in no other as far as our knowledge extends—is not genetically or genealogically significant, nor are original readings to be expected among them, so they are considered insignificant. Singular readings, however, are useful in assessing the nature and characteristics of an individual ms and its scribal habits, so they need to be identified and preserved for those purposes—and also in the event that new ms evidence renders such a reading no longer singular! Singular readings fall into two groups: those that produce sense and those that do not. Nonsense singular readings are treated as nonsense readings in general, for they contribute virtually nothing to text-critical study except perhaps to convey some general impressions as to the carefulness/carelessness of a particular scribe. Singular readings that make sense—whether they present an alternative historical, descriptive, ideological, theological, or editorial perspective, or involve orthographic differences, harmonizations, or scribal corrections—do not contribute to the major tasks of textual criticism and are therefore "insignificant" readings, though—again—they may aid in understanding a particular ms in terms of the habits of its scribe and in terms of any stylistic or ideological distinctives of that ms.

A nagging question regarding singular readings is whether a similar reading in a versional ms or patristic quotation nullifies the singular status of such a reading in a Greek ms, for currently a singular reading is defined as a singular textual divergence within the Greek ms tradition, but perhaps a singular reading should be so designated only if truly unique—that is, without support in the entire (known) NT textual tradition. As an example, numerous readings found in the Greek ms tradition only in Codex Bezae do find support in early versions or patristic sources. Readings so supported can assist in establishing textual groups and in seeking the original text.

c. Textual Variant. The term "variant" (or "textual variant") is reserved for those readings that are "significant" or meaningful in the major tasks of NT textual criticism, as specified above: determining ms relationships, locating mss within NT textual history and transmission, and in establishing the original or earliest possible NT text. Stated negatively, a "variant" is a reading that is not a nonsense reading, not a demonstrable scribal error, not a mere orthographic difference, and not a singular reading. Stated positively, a variant is a significant reading by virtue of its fitness for genetic and genealogical tracking and by virtue of its appropriateness as a possibly original reading. Thus, not all "readings" are "variants," though all "significant readings" are "variants" because of their intrinsic value for pursuing the most important goals of the discipline. The only reservation or ambiguity in these definitions (as already noted) is that "insignificant" readings can be of value (and therefore significant!) in assessing a particular ms's own textual, stylistic, or ideological characteristics and the habits of its scribe or scribes.

A first step in the text-critical process, then, is to distill from the mass of readings those that are genuine variants, for this distillate will form the body of data from which judgments can be made both about the history of the NT text and about the most likely original NT text.

2. Variation Unit. A reading and a variant by definition exist only over against another and divergent reading; therefore, a variant to be a variant must be a member of a variation unit, which constitutes the indispensable basis of comparison in textual criticism. A "variation unit" is that determinate quantity or segment of text, constituting a normal and proper grammatical combination, where our mss present at least two variant readings and where (after insignificant readings have been excluded) each of these variant readings has the support of at least two mss. Utilizing the technical definition of "variant" above, a variation unit can be defined more succinctly as that segment of text, constituting a normal and proper grammatical combination, where our mss present at least two "variants." In every case where a variation

unit is being delineated, however, the shortest or smallest possible grammatical unit should be selected, that is, the shortest grammatically related segment of text that encompasses all the variants from across the ms tradition that present themselves at that point. Text-critical practitioners quickly discover the utility of establishing variation units, for they permit the data to be displayed in a convenient fashion. But more importantly they allow for more precision and accuracy in analyzing the genuine variants in any given segment of text, for they encompass all variations *in a coherent unit of text* that are relevant to textual decisions, rather than treating individual words in isolation from their most immediate context. It will be apparent that the use of variation units also has the advantage of reducing the number of variants, for in many cases the proper variation unit is not a word, but often two or more words, or a phrase, or even entire sentences and occasionally paragraphs (as mss of the so-called Western text illustrate).

(In practice some readings are included in an apparatus that normally would be excluded by these definitions of "variant" and "variation unit." Examples would be readings in versions that differ somewhat from the Greek variants but support most or major elements of the text displayed in the variation unit, or "noteworthy" readings, that is, interesting or striking readings of mss, versions, or fathers that technically are singular readings or even nonsense readings or represent mere orthographic changes. These are included when, in the admittedly subjective judgment of an editor, they inform the text-critical process in some potentially significant fashion.)

A second step in the text-critical process, then, is the isolation of variation units in the NT text to facilitate the evaluation of the data relevant to the major text-critical tasks.

B. Occasion and Necessity

1. The Basic Transmission Process. The discipline of textual criticism is necessitated by the nature of the process by which the NT text has been transmitted to us—through mss, that is, through copies of copies of copies made by hand down through the years. Since—like virtually all ancient literature—no autographs are extant for the NT, its most likely original text must be reconstructed from these imperfect, often widely divergent, later copies. To understand this complex transmission process requires knowledge of ancient writing materials, of paleography, of scribes and scribal habits, of scribal errors and transcriptional probabilities, of scriptoria and their procedures, and of the availability and mobility of literary texts in the early Christian world. In a broader context, it also requires knowledge of the nature, development, and spread of early Christianity, including details of the relevant geographical areas, the cultural and ecclesiastical milieu of Christianity in those various areas, and the theological and personal influences that shaped Christian faith. For the earliest times and even for some later periods, our understanding of the NT text is inhibited by a lack of detailed knowledge; just as often, perhaps, the neglect of data provided by Church history has prevented advances in the discipline. (Birdsall is an example of the proper historical approach.)

Within this context, what NT textual materials have come down to us? As early as 1707, John Mill claimed that the (relatively few) NT mss examined by him contained about 30,000 variant readings (Vincent 1903: 6); 200 years later B. B. Warfield (1907: 13) indicated that some 180,000 or 200,000 various readings had been "counted" in the then existing NT mss, and in more recent times M. M. Parvis reported that examination of only 150 Greek mss of Luke revealed about 30,000 readings there alone, and he suggested that the actual quantity of variant readings among all NT manuscripts was likely to be much higher than the 150,000 to 250,000 that had been estimated in modern times (Parvis *IDB* 4: 594–95). Perhaps 300,000 differing readings is a fair figure for the 20th century (K. W. Clark 1962: 669). The textual critic must devise methods by which to sort through these myriad readings and to analyze the many mss that contain them.

It is not difficult to imagine how the NT writings were employed in the early decades of Christianity and how they were circulated in that initial period and in the succeeding decades. For instance, an apostolic letter or a portion of a gospel would be read in a worship service; visiting Christians now and again would make or secure copies to take to their own congregations, or the church possessing it might send a copy to another congregation at its own initiative or even at the request of the writer (cf. Col 4:16); and quite rapidly numerous early Christian writings—predominantly those that eventually formed the

NT—were to be found in church after church throughout the Roman world. Naturally, the quality of each copy depended very much on the circumstances of its production; some copies must have been made in a rather casual manner under far less than ideal scribal conditions, while others, presumably, were made with a measure of ecclesiastical sanction and official solicitude, especially as time passed. Great Church centers, such as Antioch, Alexandria, Ephesus, Rome, Lyon, and Carthage, must have issued copies of the Scriptures, or parts thereof, for their constituent churches, and when the Christian Church gained the official favor of the Roman Empire under Constantine, the emperor himself commissioned 50 copies of the Scripture "on fine parchment … by professional scribes" for new churches in Constantinople (Eusebius, *Vita C.* 4.36). This occurred about A.D. 331, some 280 years after Paul penned the first of his letters and about 260 years after the first gospel, Mark, was written. Codices Sinaiticus and Vaticanus, the two oldest parchment manuscripts of the NT (except for fragments), are elegant copies of the kind that Constantine must have had in mind, and they come from precisely this period—the mid–4th century.

As the study of papyri in Egypt demonstrates with considerable specificity, the Roman Empire facilitated the fairly swift and widespread movement of letters and literature, and there is no reason why Christian writings would not have enjoyed the same mobility. This is evidenced, e.g., by the fact that early NT papyri contain at least remnants of all the major kinds of texts identified as existing in the first centuries of Christianity, and yet there is no compelling reason to think that all of these kinds of texts originated in Egypt; rather, many texts now survive in early Egyptian papyri that were brought there from other areas of the Christian world (Epp 1989c).

Our four gospels gradually emerged as the Church's choice from among a larger group of gospel writings; this occurred through a process only vaguely understood but culminating sometime between A.D. 150 and 180. These four gospels most often circulated in a single codex, though sometimes with the addition of Acts or other portions of the NT. The Pauline letters also frequently circulated together, though sometimes with Acts and/or the General Epistles, and the Acts and the General Epistles are another common combination. Actually, almost every conceivable grouping of NT writings is to be found among extant mss, including about 60 codices containing the entire NT (Aland and Aland 1987: 78–79). As these mss circulated and were used and reused in churches, they were copied and recopied, and the survivors among them have left to us a legacy rapidly approaching some 5,400 Greek mss, plus thousands of versional mss and patristic quotations. These constitute the data for NT textual criticism, from which the history of the NT text must be deduced and the most likely original text reconstructed.

2. General Nature of the Manuscript Evidence. The need for textual criticism exists, of course, whether there are 5,000 or only 5 mss. The extant mss for many classical authors reach only into the hundreds (e.g., fewer than 700 for Homer's *Iliad*) and can be as few as several mss or even one (as for books 1–6 of the Latin *Annals* of Tacitus). This comparative paucity of mss, on the average, for classical authors has occasioned a correspondingly frequent use of conjectural emendation in the construction of critical editions of classical texts. In the case of the NT, however, the thousands of mss and the hundreds of thousands of readings present a genuine embarrassment of riches, and NT textual critics have only rarely employed emendations, preferring rather to assume that the original reading in virtually every case is somewhere present in this vast store of material. The difficult questions, of course, are, where have they been preserved and how do we locate them among so many witnesses?

But it is not only in quantity of mss that NT textual criticism excels in riches; their quality also exceeds those in other areas of ancient literature. For one thing, the interval between author and earliest extant mss for most classical writings is customarily hundreds—sometimes many hundreds—of years, and an interval of 1,000 years is not uncommon. For example, the single ms of Tacitus referred to earlier (of a work written about A.D. 115) dates from the 9th century, and most of the mss of Euripides (ca. 485–406 B.C.) come from the Byzantine period. The majority of the NT mss are also of late date, but the distinctive differences are that so many others are early and that the interval between the time that the NT books were written and their earliest ms representation is only a century or so. In one striking instance, a papyrus fragment of John (P^{52}) may date as early as 25 years after the gospel's composition, and several other mss with extensive portions of text are dated to around A.D. 200—for books written between A.D. 55 and 90.

Even the two elegant codices mentioned earlier, Vaticanus and Sinaiticus, were produced around 350. So both the quantity and quality of ms sources place the NT text in a category virtually by itself.

Riches such as these constitute both the complex problem that the NT text presents—for the materials are so vast and variegated—and at the same time the rare opportunity and exciting challenge facing the discipline—the advantage of a depth and breadth of material unavailable for similar bodies of ancient writings. NT textual critics, by and large, are confident that the original reading in virtually every case is preserved among the array of some 300,000 variant readings. Yet both the preservation and the discovery of NT mss are random events, and while this randomness of history has been particularly generous to NT studies, it has not furnished scholars with a systematic presentation of textual evidence, nor does it offer a complete or even necessarily representative array of ms material for each or any writing or for the various geographic areas of early Christianity. Textual criticism, however, must utilize the materials it has and devise methods that will assess them appropriately. That challenge has a history reaching back almost as far as our earliest extant mss themselves—when rudimentary methods emerged—and it remains in some measure unresolved even today.

3. Scribal Alterations. Textual criticism has been occasioned by the divergent nature of the texts in our ms remains, and it is necessitated by the quantity of ms evidence. But necessity also arises from scribal errors and alterations in the transmission process. Among our earliest extensive mss, some show signs of being copied with workmanlike care (e.g., P^{75}, P^{45}), while others appear to have been copied by rather careless scribes (e.g., P^{66}). Scribal habits, including errors and alterations, need to be analyzed carefully. Commonly they are divided into two categories: unintentional and intentional alterations. (Examples can be found in standard handbooks, e.g., Scrivener 1894: 1.7–17; Nestle 1901: 234–39; Warfield 1907: 93–107; Robertson 1925: 150–60; Vogels 1955: 162–82; Greenlee 1964: 63–68; Metzger 1968: 186–206; Vaganay 1986: 87–98.)

a. Unintentional Scribal Errors. Accidental alterations are often characterized as errors of the eye, of the ear, or of memory and (unthinking) judgment. First, those involving oversight include (1) confusion of letters that have similar appearance (uncial *alpha, delta,* and *lamda* look alike, as do *epsilon* and *sigma, omicron* and *theta, eta* and *nu, pi* and *gamma-iota* or *tau-iota/iota-tau,* etc.); (2) mistaken division of words (since uncial letters were run together in mss, without word division or punctuation); (3) misreading of abbreviations or contractions; (4) metathesis, or interchanging the order of letters or words; (5) mistaking a less familiar word for one more familiar to the scribe; (6) haplography ("single/simple writing"), the omission of one word when it occurred twice, or of two or several words (even a sentence or more—cf. Luke 14:27) that are dropped as the scribe's eye jumps from one group of letters to a similar group of letters farther down the leaf, thereby resulting in the failure to copy what lies between the two words that have a similar ending (homoeoteleuton); (7) dittography ("double writing"), repetition of a letter, word, or passage because the scribe's eye went back to what had already been copied; and (8) simple misspellings due to carelessness and failure to notice the error.

It has been a long-standing convention in textual criticism that scribes tend to lengthen the text they copy rather than shorten it (except when haplography has clearly resulted from homoeoteleuton); hence, the common acceptance of the rule, "the shorter reading is to be preferred" (see below). Recent study of scribal habits as revealed in the early NT papyri, notably by E. C. Colwell, has, however, cast some doubt on this principle (Royse 1979: 143, 150–55).

Abbreviations also require an added comment. They were frequent for divine names, for other terms, and at the ends of lines. Sometimes they were mistaken for ordinary words (or vice versa), permitting varying ways of reading the text. A special class of abbreviations, apparently created by Christians within the first two generations, concerned divine names and sacred terms and was employed in a rigidly consistent fashion. These abbreviations appropriately are called *nomina sacra* and, whether by design or not, they differentiated Christian books from both Jewish and secular books. They may have been theologically motivated, for the most prominent among them would represent—in an almost creedlike fashion—the common beliefs of all Christians. These "sacred names" were God, Lord, Jesus, Christ, Son, Father, Spirit, cross, savior, man *(anthropos),* mother, heaven, David, Israel, and Jerusalem. (On the

whole matter, see Roberts and Skeat 1983: 57–61; Roberts 1979: 46–47.) The abbreviations (really contractions) used for each were formed from two or three letters or two syllables in the word, with a horizontal line drawn above the resulting contraction. At 1 Tim 3:16, e.g., the likely original *hos* (*omicron-sigma,* "he who") may have been misunderstood as the abbreviation for "God," which was written *theta-sigma* and would look very much like the relative pronoun *omicron-sigma.*

Second, unintentional errors of the ear, occurring when scribes produced copies from dictation, include (1) itacism (relating to the vowel *iota,* though itacism involves other vowels as well), which is an interchange of various vowels and diphthongs that were similarly pronounced (such as *ai* and *e; ou* and *y; o, ō,* and *ō̧;* i, y, ē, ę̄, ei, oi, and *ui*), and the *nu*-movable (presence/absence of the letter *nu* at the end of certain Greek forms); (2) interchange of certain similar-sounding consonants or combinations of letters (as in Matt 2:6: *ek sou* for *eks hou*), or of single consonants for double, or vice versa; and (3) failure to emphasize or hear a rough breathing mark.

Finally, unintentional errors resulting from a momentary lapse of memory include (1) the use of a synonym for the word in the exemplar (when the scribe remembers the meaning but not the exact word); (2) a change of word order; (3) an unconscious assimilation to the similar wording of another biblical passage or liturgical formulation that is better remembered than the wording the scribe has just seen in the exemplar (though this assimilation could as well be intentional harmonization [see below]); and (4) unconscious harmonization with a word, phrase, or grammatical formulation in the immediate context of the passage then being copied. In addition, errors due to poor judgment may be included here, though—like certain cases of harmonization—some may deem them intentional. The most common one involves material placed in the margins by earlier scribes or by readers of the ms being copied. These marginal notations could be corrections to the text, glosses (interpretations of or comments on the text), or even material not directly related to the text. The error of unthinking judgment comes when a scribe incorporates one or more of these marginal notes from the exemplar into the text of the ms being produced.

b. Intentional Scribal Alterations. Changes made intentionally by scribes as they copied texts were motivated, in virtually all cases, by a desire to improve the text or to correct it in accordance with what they believed to be its true reading. Purposefully destructive change, at least as perceived by the scribe, is unknown. Moreover, it is customary to say that a slavish scribe—and better still, one of only modest intelligence—is to be preferred to one who thinks for himself. It is the thinking scribe who is more likely to make intentional alterations in the text, inevitably in good faith and out of worthy motivations, including occasional changes made to introduce or promote a viewpoint not in the text being copied. As a class, intentional alterations are far fewer than accidental ones, yet they can exercise far more influence in the transmission process.

The categories of intentional scribal changes include (1) alterations in grammar, spelling, and style, including the spelling of proper names; (2) intentional harmonizations to bring the passage being copied into conformity with one similar or parallel (such as a parallel in the Synoptic Gospels), or with an OT quotation (sometimes expanding it to include more of the source or conforming it to the LXX), or with a liturgical passage in the Church lectionaries, or even to bring a passage into conformity with a translation known to the scribe or found in a bilingual ms; (3) clarification of perceived geographical or historical discrepancies, such as references to time or place, or to authors of OT quotations; (4) conflation of varying readings present in two or more mss accessible to the scribe, yielding a full text; (5) addition of logically appropriate material, such as expanding "Jesus" or "Lord" to "the Lord Jesus Christ"; and (6) theological or ideological alterations, usually involving minor changes in the interest of the Virgin Birth, the omniscience of Jesus, the trinity, or asceticism, to mention a few examples, as well as extensive additions of material, as found, e.g., in mss of the so-called Western text.

C. Major Source Materials for the NT Text

The NT text has been preserved in Greek mss; in numerous ancient (and, of course, modern) translations or versions; in liturgical documents, primarily lectionaries, surviving in Greek and other

languages; and in NT quotations by Church Fathers in various languages. All of these become sources for readings and for textual variants in the process of restoring the NT text.

1. Greek Manuscripts. Greek mss of the NT, now numbering more than 5,300, customarily have been characterized in three differing ways: (1) by the material upon which they are written (papyrus, parchment, or paper); (2) by their calligraphic type (uncial or minuscule handwriting); and (3) by the function of the document containing the text (continuous-text ms, lectionary, or patristic quotation). The traditional way of listing them, however, cuts across these categories (utilizing one or two from each!) and follows the scheme of papyri, uncials, minuscules, lectionaries, and patristic quotations.

a. Writing Materials and Calligraphy. The NT was first written on papyrus—undoubtedly both the autographs and the earliest copies—as are the oldest extant NT mss, virtually all of which consist of or have come from mss in codex form. Papyrus was used as a writing material as early as 3000 B.C. and was still manufactured in Egypt as late as the 11th century A.D.; Greek writing on papyrus goes back to the 4th century B.C. and extends to the 8th century A.D.

As is well known, the freshly cut lower stems of papyrus plants were peeled off in long strips, were placed side by side, slightly overlapping, and then covered by another set of strips laid crosswise, and finally were struck with several blows from a broad mallet or a flat stone to fuse the two layers together into a sheet, which—when dried and polished with pumice—produced a strong, flexible, light-colored, and durable writing material. Contrary to popular opinion of long standing, papyrus was not a particularly fragile substance that was far inferior in durability to parchment. Papyrus does become brittle and subject to instant disintegration, however, when it has been repeatedly wet and dry. It survives, therefore, only when protected from moisture in buildings, caves, jars, or even in the soil of the virtually rain-free areas of Egypt, Palestine, and Mesopotamia, provided that the papyrus was neither too near the surface nor so deeply buried as to be affected by a rising water table. It has also been assumed that papyrus was expensive, but the fact that vast quantities were used, often with wide margins and large unwritten spaces, and that reuse (though quite feasible) was infrequent, indicates that at times, at least, papyrus as a writing material was quite inexpensive (evidence summarized in Epp 1989b).

For Greek literary works, papyrus sheets were glued together to form a roll or scroll; in Christian circles, papyrus sheets were turned into a codex, that is, into our form of the book, constructed of folded sheets bound at one edge. For reasons still not entirely clear, all of the Christian mss that survive from the 2d century (six OT texts made for Christian use and five NT texts) are on papyrus and are in codex form, which has led to the theory that Christians invented the codex and that the earliest codices were made of papyrus, or—if Christians did not invent the codex—that they immediately adopted it as the only suitable form for their writings (Roberts and Skeat 1983: 40–42).

Papyrus mss, in codex form, were used by Christians from the earliest times into the 8th century. They constitute only 3% of NT continuous-text mss and less than 2% of all NT mss, though, of course, far less than that in the amount of extant Greek NT text, since most of the papyri are highly fragmentary. Qualitatively, however, they enjoy an importance inversely proportionate to the small amount of text they presently preserve.

Meanwhile, around the turn of the 2d/3d century (A.D. 200), NT mss began to be copied on parchment or vellum. Though the terms are now used as synonyms, vellum technically is calfskin prepared as a writing material, while parchment technically is writing material processed from other animal skins. Among all the sources for parchment, skins of sheep and goats were preferred. Preparation of skins for use as writing material (i.e., leather, which was tanned) may reach as far back as 2500 B.C., but the invention and extensive manufacture of parchment is associated by tradition with the city of Pergamum in the 2d century B.C., and the term "parchment" is related etymologically to "Pergamum."

In these Hellenistic times, skins were soaked (with little or no tanning agents) for cleaning and removal of hair and, while wet, were stretched, and then were allowed to dry, a process in which the adhesive pelt fluid dried to give the material a firm consistency and to set the fibers in the stretched condition: "Having become trapped in their own adhesive the fibres cannot revert to their former relaxed state and the result is a highly stressed sheet which is smooth, strong, relatively inelastic, light in colour, yet opaque" (Reed

1975: 44). Leathers were not stretched; parchment was, and the extremely durable material that resulted took inks and colors well and could be written on both sides. The stability of parchment also permitted its reuse, after scraping and washing the existing writing off the surface; such a ms is called a *palimpsest* (i.e., "scraped again"). Some 50 NT mss prior to the 11th century are palimpsests, among which the most famous is Codex Ephraemi Syri Rescriptus (C), whose NT text dates to the 5th century. It was first deciphered by C. Tischendorf through application of a (destructive) chemical reagent, but today it and other palimpsests can be read by use of ultraviolet photography, which recently has been further aided by computer enhancement techniques.

Parchment codices were standard for copies of the NT text until the very late Middle Ages when paper finally replaced parchment (14th–15th centuries) and when printing replaced hand copying (15th century). Roughly 75% of all Greek NT mss are on parchment (ca. 4,000, including some 2,400 continuous-text mss and some 1,600 lectionaries). Paper mss, therefore, are more common than might be supposed, numbering roughly 1,200 (somewhat evenly divided between the minuscules and lectionaries) and ranging in date from the 12th to the 19th centuries, with most originating in the latter part of this period.

As for *calligraphy,* until the 9th century Greek ms of the NT (both papyrus and parchment) were written exclusively in uncial script (using large-sized, unconnected capital letters), and uncials continued to be employed in the following century. Minuscule script (using lowercase, cursive or "running"—connected—letters) was used from the 9th centupy on. The earliest dated NT minuscule (no. 461) was copied in 835. Minuscule script, as its name implies, was smaller, requiring less space, and its connected style permitted more rapid writing. Minuscules, therefore, were easier and quicker to produce and less expensive than uncials, and the legacy of NT textual materials is likely to be larger than might have been the case had the uncial hand persisted. About 12% of NT mss are in uncial script (some 650) and 88% in minuscule (some 4,650). NT uncial mss are found on papyrus and parchment, minuscules on parchment and paper.

b. Function and Form of NT Mss. NT mss assumed certain forms in accordance with their functions. The predominant form in which the NT text has been preserved is the *continuous-text ms,* i.e., a ms recording the text of at least one NT book (even if no longer fully preserved) in a continuous fashion without additional context (though occasionally an interlinear or separate commentary to the text may be part of the ms). These mss may be written on papyrus, parchment, or paper and may be either in uncial or minuscule hand. Continuous-text NT mss number about 3,125, including about 94 different papyri in uncial script, about 270 different uncial mss on parchment, and around 2,750 minuscules on parchment or paper (of which more than 2,100 are on parchment).

A second form is the *lectionary.* Lectionaries are mss containing portions of biblical text for reading in church services. NT "lessons" from the Gospels and Epistles are arranged not in the order of the NT canon, but in accordance either with the Church year (called the synaxarion), which runs from Easter to the next Easter and which contains readings for specified Saturdays, Sundays, and weekdays of the ecclesiastical year, or with the calendar year (called the menologion), which begins with September 1 and contains readings for feast days, saints' days, and other days of the Church year and for special Church occasions. Lections vary in length from a few verses to a few chapters, with a customary length of about ten verses. Since these segments of text have been extracted (originally) from the NT writings, that is, from continuous-text mss, an introductory formula (called an *incipit*) often had to be added to accommodate the text to liturgical usage, including such standardized phrases as "The Lord said …," "At that time …," or "In those days …" At times minor changes had to be made in the text itself, such as altering a pronoun (e.g., "he") to a noun (e.g., "Jesus"), to insure a meaningfully independent and self-explanatory portion of text (Colwell and Riddle 1933: 1–5; Metzger 1972: 479–84).

By their very nature, these liturgical texts are likely to have been transmitted rather carefully and preserved with a considerable measure of conservatism. They are likely, however, to have been copied almost exclusively from exemplar lectionaries, rather than scribes freshly extracting the relevant portions from continuous-text mss—that would be too tedious. This conservatism in the copying process suggests that Greek lectionaries, which range in date from a few 4th-, 5th-, and 6th-century uncial fragments to

paper mss of the 18th century and later, are certainly more important than these relatively late dates suggest, for—more so than other mss—they are likely to preserve texts substantially earlier than their own dates. Yet this is a relative statement, for the origin of the Greek lectionary system is debated, with suggestions ranging from the 4th century to much later—perhaps the 7th or 8th century (Aland and Aland 1987: 163–66; Metzger 1972: 495–96). Basically, and overwhelmingly, the lectionaries carry a Byzantine text (see below), and they have significance for studying the development of the NT text, but little importance in establishing the original text. Their role in the latter is chiefly to aid in identifying readings introduced into continuous-text mss from the lectionary system, especially the *incipit*, which monks who are scribes would be prone—out of familiarity with lections—to transfer from their memories to the texts they are copying (Metzger 1972: 495; Aland and Aland 1987: 166).

NT lectionary mss in Greek number around 2,200, of which nearly 90% (more than 1,900) are minuscules and the rest uncials (about 270). Two uncial lectionaries date as early as the 4th and 5th centuries, about seven more in the 6th and 7th, with large numbers originating in the 9th and 10th, and with vast numbers of minuscule lectionaries stemming from the 11th and 12th centuries and thereafter (Aland and Aland 1987: 81). Over all, 75% are on parchment, with the rest on paper (dating from the 12th century on), and the majority of lectionaries consist of gospel readings. Needless to say, lectionaries occur also in other languages, but they are classified with the appropriate versional mss.

c. Aids to Readers of Manuscripts. Ancient mss, including those of the NT, contained relatively few helps for the reader. Words and sentences usually were not separated from one another, occasionally leading the reader to divide words in alternate ways with differing meanings; virtually no punctuation occurred until the 6th or 7th centuries (see examples in Scrivener 1894: 48–49); similarly, breathing marks and accents are rare prior to the 7th century, though after this time they occasionally were added by a later hand to earlier mss (as, e.g., in Vaticanus; see other examples ibid.: 45–48); and only rudimentary and differing systems of chapter division were employed. Already Vaticanus, Sinaiticus, and Alexandrinus, e.g., had marginal capitular systems, though they were not the same ones.

To assist in locating parallel passages in the gospels, Eusebius (ca. 263–339) devised a system of ten "canons" or tables (known as the Eusebian Canons) that divided the gospel material into sections and identified those that were found in all four gospels (canon I), those in each combination of three gospels (canons II–IV); those in each combination of two gospels (canons V–IX), and finally those sections in only one of the gospels (canon X). Thus, all the possible combinations were exhausted. Each section in each gospel was then numbered consecutively, and these section numbers, along with their appropriate canons, were placed—in colored ink—in the margin of a ms. The reader, by looking up the section number in the designated canon, could find the numbers of any parallel sections in other gospels (the canons are reproduced in Nestle-Aland^{26}: 73*–78*; cf. Metzger 1968: 24–25).

d. Traditional Classifications of Greek NT Manuscripts. Greek NT mss customarily are placed into one of four groups, *papyri, uncials, minuscules,* or *lectionaries,* to which is added a fifth class, *patristic quotations.* Of course, patristic quotations, as used in textual criticism, are not directly mss, for they must be quoted from critical editions; yet there is no reason to depart from the usual classifications.

A system of symbols had to be developed for easy reference to the various mss, for it was too cumbersome to refer constantly to Codex Alexandrinus or Codex Ephraemi Syri Rescriptus or Codex Bezae Cantabrigiensis, especially in a critical apparatus. J. J. Wettstein, in his critical edition (1751–52), developed the first such system of ms designations when he used capital letters for uncials and small letters for minuscules. He started the alphabet afresh for each segment of the ms tradition, that is, assigning letters A, B, C, etc. to the uncial gospel mss, then A, B, C, etc. again to mss of the Acts, then to those of Paul, and finally to those of the Apocalypse; then in similar fashion assigning lowercase letters to each group of minuscules.

Late in the 19th century this system was expanded and refined by C. R. Gregory, and the numbers he assigned in his 1908 list constitute the basis for the system still in use today. Naturally, the Latin alphabet was not adequate as more mss were discovered, so the Greek alphabet was also used and—for a while—a few letters of the Hebrew alphabet (of which only *alep* remains in common use, for Sinaiticus). These

additional symbols were also inadequate, however, and the present system (referred to as Gregory numbers) employs Arabic numbers for all ms groups, though in differing ways. Numbers of papyri are preceded by P, as in P^{75}, those assigned to uncials by a zero, as in 0171, but the familiar capital letters earlier assigned to many uncials remain in common use (such as A, B, C, D, W), though each of these also has a number (e.g., A = 02, B = 03, C = 04; D of the gospels and Acts = 05; D of Paul = 06). Minuscules are designated simply by successive numbers (such as 1, 69, 1739), and lectionaries are consecutively numbered but preceded by a cursive letter *l* (°).

Others attempted to assign symbols that would be more rigidly consistent as well as more descriptive of the mss involved. The most elaborate such effort was that of H. von Soden (1911–13), who divided all witnesses into three groups, using the Greek letter *delta* for manuscripts preserving the entire NT (including those lacking the Apocalypse), *epsilon* for mss of the gospels, and *alpha* for those of the Acts and Epistles. Then an Arabic number was assigned to each in such a way that it indicated the ms's date—1 to 49 for a *delta* ms through the 9th century, etc. Thus, each ms designation would convey both its content and its age. For example, *delta* 1 would indicate a ms of the whole NT dating in the first nine centuries; but this happens to be Vaticanus, and the age indication is much too broad to be useful, for it is of highest importance to know that Vaticanus dates in the mid-4th century rather than merely somewhere before the 10th. Von Soden's system is much more complicated than these few remarks suggest, and something of its complexity can be gauged from the fact that several concordances of ms references, or "keys," were produced to permit translation of von Soden's symbols into those of Gregory, and vice versa (the latest occupies 38 pages in Aland 1963: 334–71). In addition, von Soden's system was neither sufficiently precise (in terms of mss of early date) nor sufficiently flexible to accommodate the many additional mss that came to light after 1913. Accordingly, it has fallen into disuse, though it must be understood so that text-critical discussions by scholars who employed it can in turn be understood.

What follows is necessarily a summary of some of the most important witnesses to the Greek NT text. The standard handbooks provide similar summaries for their times, and catalogs of mss provide the appropriate detail for this primary material. In the final analysis, of course, the original publication of a particular ms inevitably provides the fullest array of data and analysis. The latest full list of the papyri and uncials, as well as a select list of about 150 minuscules and a list of Greek Church Fathers, with brief descriptions, can be found in Aland and Aland 1987: 96–155 (cf. Aland 1963, with update, 1969; also 1976, a descriptive catalog of NT papyri). More convenient for most will be the list of mss in *UBSGNT*^{3} (905–7), supplemented in *A Textual Commentary on the Greek New Testament* (= Metzger 1971: 771–75), but especially that in Nestle-Aland^{26} (684–711), which provides a handy chapter-and-verse indication of the exact contents of each papyrus and uncial, or—in the case of very extensive manuscripts—their lacunae. Lacunae are also noted for minuscules cited individually in Nestle-Aland, but not for the vast number cited under the symbol "M" (= Majority text). Notable among other handbooks with brief descriptions of selected mss are Metzger 1968: 36–67; Vogels 1955: 7–73; Lagrange 1935: 41–181, 389–420, 465–87, 529–38, 579–97; Kenyon 1912: 41–144; 1949: 66–110; Gregory 1907: 299–393; Nestle 1901: 28–93; Scrivener 1894: 1.90–377. For more extensive treatments of mss known at the time, see Gregory 1908; 1909; von Soden 1911–13: 1.102–248; for mss in America, K. W. Clark 1937.

(1) Papyri. Presently 96 NT papyri have been identified, though two of these are portions of others (P^{33} = P^{58}; P^{64} = P^{67}), leaving a total of 94 different papyri. They range in date from the 2d century to the 8th, and all but four are from codices (the four, P^{12}, P^{13}, P^{18}, P^{22}, are from scrolls, though all are exceptional in that they are either written on both sides or are on reused papyrus [Aland and Aland 1987: 102]). These 94 papyri range in extent of coverage from tiny fragments (like P^{52} of John) to extensive portions (in papyri like P^{66}, P^{75}, and P^{72}).

The first NT papyrus came to light in 1868, when C. Tischendorf published a fragment containing 62 verses of 1 Corinthians (now designated P^{11}); but the first major flow of NT papyri came from the Oxyrhynchus excavations in 1897ff. by B. P. Grenfell and A. S. Hunt, which eventually produced 28. More remarkable is the fact that 20 of these (plus one uncial fragment found there, 0162) date to the turn

of the 3d /4th century or earlier. By 1930, 42 papyri had been published, though all were highly fragmentary.

A significant change came when the Chester Beatty papyri were made available in 1930–31, for the three most prominent (P^{45}, P^{46}, P^{47}) were the first NT papyri to preserve extensive portions of text. Equally important—if not more so—were the early dates of these three mss: P^{46} from about A.D. 200 and P^{45} and P^{47} from the 3d century.

P^{45} contains 30 leaves of an original codex containing the four gospels and Acts in perhaps 220 leaves. Now surviving are 61 verses of Matthew (20:24–30; 21:13–19; 25:41–26:39); about 6 chapters of Mark (4:36–9:31; 11:27–12:28); more than 5 chapters of Luke (6:31–7:7; 9:26–14:33); most of John 10 and 11; and 13 chapters of Acts (4:27–17:17).

P^{46} contains 86 leaves of an original 104, which held 10 epistles of Paul (but apparently not the Pastorals), plus Hebrews, though the usual order of Galatians and Ephesians has been reversed and Hebrews stands between Romans and 1 Corinthians. Extant are eight chapters of Romans; all of Hebrews; virtually all of 1–2 Corinthians; all of Ephesians, Galatians, Philippians, Colossians; and two chapters of 1 Thessalonians (but none of 2 Thessalonians)—all leaves suffering some loss of lines at the bottom.

P^{47} preserves 10 leaves of an estimated 32 originally, and it held the Apocalypse, of which 8 middle chapters are extant (9:10–17:2).

Important as these discoveries were, more significant ones were to follow, when around 1955–56 four codices came into the possession of M. M. Bodmer of Geneva, the priceless P^{66}, P^{72}, and P^{75}, and the 7th-century P^{74}, as well as a fifth containing three verses of Matthew (P^{73}). Three of these codices are of very early date: P^{66} (like P^{46}) from about A.D. 200, and P^{72} and P^{75} from the 3d century; moreover, as noted earlier, they preserve extensive portions of text.

P^{66} has 104 pages of John's gospel (1:1–6:11; 6:35–14:15), plus fragments of 46 other pages (14:26–21:9, with lacunae).

P^{72} is the earliest known copy of 1–2 Peter and Jude and contains the entire text of these epistles.

P^{75} retains 102 of its original 144 pages and preserves chaps. 6–17 and 22–24 of Luke, as well as portions of chaps. 3–5 and 18; in addition, it has virtually all of John 1–12 and portions of 13–15. P^{75} is the oldest known copy of Luke, and its text (of both Luke and John) is extraordinary for its close similarity to that of Vaticanus.

P^{74} contains, with numerous lacunae, Acts 1:2–28:31, and portions of James, 1–2 Peter, 1–3 John, and Jude.

Further papyri have been published since, but none that in any way matches the combination of early date and extensive text found in the Chester Beatty and Bodmer mss. There are, however, 43 other very early papyri that, by virtue of dating prior to the early 4th century, rightfully deserve mention, though they are all highly fragmentary: P^{52} (early 2d century); P^{32}, P^{46}, $P^{64/67}$, P^{66} (about A.D. 200); P^{90} (2d century); P^{77} (2d/3d century); P^{1}, P^{4}, P^{5}, P^{9}, P^{12}, P^{15}, P^{20}, P^{22}, P^{23}, P^{27}, P^{28}, P^{29}, P^{30}, P^{39}, P^{40}, P^{45}, P^{47}, P^{48}, P^{49}, P^{53}, P^{65}, P^{69}, P^{70}, P^{75}, P^{80}, P^{87} (3d century); and P^{13}, P^{16}, P^{18}, P^{37}, P^{38}, P^{72}, P^{78}, P^{92} (3d/4th century). To this list of our earliest mss should be added the four earliest uncials known to us: 0189 (2d/3d century); 0220 (3d century), and 0162 and 0171 (3d/4th century), for they fall into the same earliest period. (See Aland and Aland 1987: 56–64, 96–102.) These mss, because of their extraordinarily early dates, occupy a position of supreme importance in all aspects of NT textual criticism, especially its history and theory.

(2) Uncials. As a classification of NT mss, "uncials" is not used to refer to all NT mss written in uncial characters (about 650), but only to continuous-text mss so written on parchment (about 270). Thus, the papyri and the more than 270 lectionary mss written in uncials are classified under papyri and lectionaries, respectively, and not here.

Continuous-text uncials total about 290, but the number of different uncials is closer to 270, due to the continuing process of uniting separated fragments with their original mss (Aland and Aland 1987: 105; see 106–25 for a full list of uncials). Uncials date from the 2d/3d century through the 10th century. Only 4 predate the early 4th century (0189, 0220, 0162, 0171); 14 stem from the 4th century—including the two most famous uncials, Codices Sinaiticus and Vaticanus; but 54 survive from around A.D. 400 to 500; and

uncials increase as one moves into the later 6th and through the 9th centuries, with the last 19 originating in the 10th century. It should not be assumed, however, that uncials inevitably preserve large segments of NT text; the oft-mentioned, famous codices like Sinaiticus, Vaticanus, and Alexandrinus have extensive text, as do many others, but in reality only 35 percent of all uncials survive in more than two leaves. To be more precise, only 59 uncials (about 22 percent) contain more than 30 leaves and only 44 uncials (about 16 percent) have more than 100 leaves. Of this latter group, 17 contain 100 to 199 leaves; 16 have 200 to 299; 9 have 300 to 399; and only 2 have more than 400 (Bezae [05] with 415 and Claromontanus [06] with 533 leaves).

Among the uncials, perhaps five mss stand out from all the rest; all are of early date (4th or 5th century) and of crucial importance in NT textual transmission and for the discipline generally.

Codex Sinaiticus (א) is the only uncial presently containing the entire NT (though Alexandrinus still contains portions of every NT book). Sinaiticus also has virtually all of the OT, as well as the *Epistle of Barnabas* and the *Shepherd of Hermas.* It dates from the 4th century and its large pages contain four columns each—the only NT ms written in this fashion.

Codex Alexandrinus (A) is of somewhat later date—in the 5th century—and lacks only portions of Matthew (up to 25:6), John (6:50–8:52), and 2 Corinthians (4:13–12:6) from its NT, and it contains the OT, as well as *1–2 Clement.* It is written in two columns and its text appears to have been copied from different exemplars, for its gospel text is akin to the Byzantine type, while the remainder of the NT has a text like that in Sinaiticus and Vaticanus.

Codex Vaticanus (B), 4th century, is written in three columns and contains all of the NT except an extensive portion from Heb 9:14 through Revelation; it also has the OT, though it begins with Gen 46:28 and lacks Ps 105:27–137:6. Vaticanus would be regarded by all as the most valuable uncial ms of the NT, and by many as the most important of all NT mss, due to the combination of its early date, its broad coverage of the NT, and the excellent quality of its text, which—for the overlapping portions—is strikingly similar to that in P^{75}.

Codex Bezae Cantabrigiensis (D) contains, on Greek and Latin facing pages, the four gospels (in the order Matthew, John, Luke, Mark), Acts nearly complete, and a small portion of 3 John. Its date is 5th century, or possibly late 4th. It is written in one column, but in sense lines rather than in the usual fashion of simply filling the lines. Bezae, with many striking additions to the text (and some omissions), is the major Greek representative of the so-called Western type of text, which some have considered the earliest form of the NT text, but which others have viewed as a later, derivative development.

Codex Washingtonianus (W), also known as the Freer Gospels (for C. L. Freer of Detroit, who acquired it in 1906), has the four gospels virtually complete (though in the order of Matthew, John, Luke, and Mark) and dates from the early 5th century. Its text is of mixed character, with various sections of varying length representing rather different textual types: Byzantine in Matthew and most of Luke; Alexandrian in the rest of Luke and most of John; and so-called Western in Mark 1:1–5:30, but like the text of P^{45} in 5:31–16:20. It may be best known for the material it inserts into the already longer ending to Mark (16:9–20) that it shares with other witnesses: it adds at 16:14 a paragraph that includes an excuse by the disciples in response to the risen Christ's chiding of them for unbelief.

Other uncials of special significance should be noted briefly.

Codex Ephraemi Syri Rescriptus (C) is a 5th-century ms of the whole Bible that was erased in the 12th century and reused for writings of Ephraem of Syria, though now it has many lacunae in the roughly 60% of the NT that remains. Yet extensive segments are extant of all NT books except 2 Thessalonians and 2 John, of which nothing is preserved.

Codex Claromontanus (D^P) is a 6th-century ms of the Pauline letters and Hebrews, which —like Codex Bezae—is a Greek-Latin bilingual codex written in sense lines, which was at one time in Theodore Beza's possession. And for the last century its text has been considered to be similar in character to that of Codex Bezae; that is, D^P has been recognized as the leading Greek witness to a so-called Western text of the

Epistles, just as Bezae has long been considered the chief Greek witness to a Western text of the Gospels and Acts. (Aland and Aland 1987: 108, however, disagree with this assessment of Claromontanus.)

Codex Laudianus (E^a) contains the Acts (except for 26:29–28:26) and dates from the 6th century. It is bilingual, but with the Latin in the place of honor on the left or verso and the Greek on the right; the Latin follows the Greek in a slavish manner. Its text is best described as "mixed," that is, showing agreements with Codex Bezae but also with the Byzantine text.

Codex Coislinianus (H^P), from the 6th century, contains portions of 1–2 Corinthians, Galatians, Colossians, 1 Thessalonians, Hebrews, 1–2 Timothy, and Titus in an Alexandrian kind of text. Its present 41 leaves—used in the Middle Ages for binding other books—are now in six widely spread libraries.

Codex Freerianus (I), or the Washington Codex of the Pauline Epistles, dates from the 5th century and contains 1 Corinthians through Hebrews with numerous lacunae. About 40% of its original leaves survive, and its text is Alexandrian.

Codex Regius (L) is a gospel codex from the 6th century with very few lacunae, but with two endings to Mark, the common 14:9–20, but also the so-called shorter ending. It is poorly written, but with an Alexandrian kind of text.

Codex Borgianus (T) is a 5th-century Greek-Sahidic ms with portions of six chapters of Luke and seven of John. Three other uncials (0113, 0125, 0139) have been identified as parts of the same ms, which together total about nine leaves. Its text is Alexandrian in complexion.

Codex Dublinensis (Z), a 6th-century palimpsest ms of Matthew (with lacunae), carries an Alexandrian form of text.

Codex Koridethi (theta) is an interesting 9th-century ms of the Gospels (lacking only Matt 1:1–9; 1:21–4:4; 4:17–5:4), not only because it is written in a rude hand by a scribe who did not know Greek, but, more so, for the nature of its text. In Matthew, Luke, and John it is Byzantine, but its text of Mark cast it, formerly, in the role of the leading member of the later phase of the so-called Caesarean text (see below).

048 is a double palimpsest whose earliest text (5th century) contains small portions of Acts, the Catholic Epistles, and the Pauline Epistles (though not Galatians or 2 Thessalonians).

There are other uncials, all fragmentary, that should be listed briefly as important by virtue of their early dates. First, there are the several uncial fragments that predate the 4th century and are properly classified with the earliest papyri, namely, 0189 (Acts 5:3–21) and 0220 (Rom 4:23–5:3, 8–13), both of the 3d century, and 0162 (John 2:11–22) and 0171 (Matt 10:17–23, 25–32; Luke 22:44–56, 61–64) of the 3d/4th century. Next are 058 (Matt 18:18–29); 0169 (Rev 3:19–4:3); 0185 (1 Cor 2:5–6, 9, 13; 3:2–3); 0188 (Mark 11:11–17); 0206 (1 Pet 5:5–13); 0207 (Rev 9:2–15); 0221 (most of Rom 5:16–6:3); 0228 (Hebrews 19–21, 23–25; 0231 (Matt 26:75–27:1–3, 4); and 0242 (Matt 8:25–9:2; 13:32–38, 40–46), all of the 4th century, which places them in the same period as Codices Sinaiticus and Vaticanus. Others, 057 (Acts 3:5–6, 10–11); 059 (Mark 15:29–38); 0160 (Matt 26:25–26, 34–36); 0176 (Gal 3:16–25); 0181 (Luke 9:59–10:14); 0214 (Mark 8:33–37); 0219 (Rom 2:21–23; 3:8–9, 23–25, 27–30); and 0270 (1 Cor 15:10–15, 19–25), date to the 4th/5th century, just prior to the period of Codices A, C, W, D, and others of the 5th century.

These early uncials, both the great codices of the 4th century and the fragmentary ones up to the turn of the 4th/5th century, provide some perspective on the textual situation at this time.

(3) Minuscules. Some 80 percent of the minuscules are solid representatives of the Majority text and to that extent at least they will contribute little to the establishment of the original text, for the Byzantine or Koine text (to use two other terms for the Majority text) is a text type that developed from the early 4th century on and became the well-established and official ecclesiastical text of the Byzantine Church. Yet among the minuscules are some (nearly 10%, according to Aland and Aland 1987: 128) that may have much to contribute to recovery of the original NT text. Some of these, as well as several minuscules noteworthy for other reasons, are noted below. For a list of about 150, see Aland and Aland 1987: 128–35; for descriptive comments on about 20 prominent minuscules, see Metzger 1968: 61–67; cf. Vogels 1955: 65–69; for older descriptive lists, see Gregory 1909: 124–326; von Soden 1911–1913: vol. 1; Scrivener 1894: 1.189–326.

Minuscule 1 (12th century) is distinguished for its use by Erasmus—as a supplement to his main source, Minuscule 2—for the first published Greek NT (1516). In 20th-century textual criticism, Codex 1 was identified as the head of a group of similar mss known as Family 1 (1, 118, 131, 209, 1582), whose text has affinities with the text in Codex *theta;* together, these and other mss were considered part of the so-called Caesarean text. Codex 1 contains the entire NT except the Apocalypse.

Minuscule 13 (13th century) contains the gospels (with lacunae) and heads a group of a dozen mss named Family 13, which, again, was identified earlier as a major component of the so-called Caesarean text.

Minuscule 33 (9th century) contains the whole NT except the Apocalypse, with a few chapters missing in each gospel, and has long been called the "queen of the cursives" because its text is akin to the Alexandrian kind of text found in the great uncials.

Minuscule 69 (15th century) includes the entire NT (with lacunae) and is written partly on parchment and partly on paper. It is a prominent member of Family 13.

Minuscule 81 (a dated ms from 1044), which contains Acts (except 4:8–7:17 and 17:28–23:9) and the Epistles, is significant because its text is of the Alexandrian type.

Minuscule 383 (13th century) has the Acts and Epistles, with so-called Western readings in Acts 13–22, which are largely shared by 614.

Minuscule 565 (9th century) is a magnificent copy of the gospels (lacking only John 11:26–48; 13:2–23), written with gold ink on purple parchment and containing the "Jerusalem colophon"—a statement that it was copied "from the ancient mss of Jerusalem"—which appears also in some 13 other mss.

Minuscule 579 (13th century) appears to be a copy of a much older ms of the gospels with an Alexandrian kind of text, especially in Mark, Luke, and John. It not only has the "longer ending" of Mark (16:9–20), but also the added "shorter ending."

Minuscule 614 (13th century) contains the Acts and Epistles in a text with numerous affinities with the so-called Western kind of text (cf. 383).

Minuscule 700 (11th century) is a gospel codex with upward of 300 singular readings and noteworthy for its reading, in the so-called Lord's Prayer (Luke 11:2), of "Let your holy spirit come upon us and cleanse us" in place of the usual "Let your kingdom come"—a reading shared in Greek only by minuscule 162.

Minuscule 892 (9th century) has the gospels, though only half of its original text of John remains. It is important because of its early date, but more so because it preserves the early, Alexandrian kind of text.

Minuscule 1241 (12th century) contains the NT, with lacunae and later supplements, though not the Apocalypse. It has numerous noteworthy readings.

Minuscule 1243 (11th century) is important for its text of the Catholic Epistles, though it contains the entire NT except the Apocalypse.

Minuscule 1424 (9th/10th century) heads a large family of manuscripts. It has the whole NT (except Matt 1:23–2:16) with a marginal commentary (though not on the Apocalypse) taken from various Church Fathers, and its text of Mark appears to be of special interest.

Minuscule 1739 (10th century) preserves the Acts and Epistles (except Acts 1:1–2:6, which have been supplied by a later hand) in a generally Alexandrian text form. It may have been copied from a 4th-century exemplar, because its valuable marginal notes taken from early Church Fathers end with Basil (330–79).

Minuscule 2053 (13th century) contains the text of the Apocalypse with the commentary of Oecumenius. Its quality of text is rated by some above the early uncials and even papyri (Metzger 1968: 65–66; Aland and Aland 1987: 134).

Minuscule 2062 (13th century) has the text of the Apocalypse, except for 2:1–14:20, and a commentary. Its text is similar in quality to 2053.

Minuscule 2344 (11th century) contains the Acts, Epistles, and Apocalypse (with lacunae). Its text of the Apocalypse often agrees with 2053, and it is important in the other sections as well, particularly in the Catholic Epistles.

Minuscule 2427 (14th century) survives in 44 leaves of the gospel of Mark and may contain an early form of text.

Minuscule 2464 (10th century) is a relatively early minuscule ms of Acts and the Epistles, though it lacks about five chapters of Romans and all of 1–2 Timothy, Titus, Philemon, and Hebrews.

(4) Lectionaries. Though the lectionary mss of the NT number 2,200 or more, they are not often cited in the critical apparatus of Greek NT texts because they overwhelmingly preserve a Byzantine text and are not critical in establishing the original NT text. Greek lectionaries do not include the Apocalypse, for there were no readings from this book in the Church year; the same applies to some passages of Acts and the Epistles. The Nestle-Aland[26] cites only 5 lectionary mss (numbers 32, 44, 185, 1575, and 1602); the *UBSGNT*[3] cites 52 systematically and 97 from other critical editions of the Greek NT. The American and British Committees' apparatus of Luke (1984–87) cites 10 lectionary mss that were scientifically selected as representatives of the "dominant" lectionary text (numbers 69, 333, 513, 852, 853, 867, 991, 995, 1084, 1750—dating from the 10th to the 13th centuries) and also 31 others that represent a "divergent" text.

The current list of lectionary mss can be found in Aland 1963; 1969; older descriptive lists appear in Gregory 1909: 327–478; Scrivener 1894: 1.327–76.

(5) Patristic Quotations. Passages of the NT quoted by writers in the early Church constitute an important body of data for textual criticism, for they provide narrowly dated and geographically located textual readings. That is, from them we have an indication of the form that a text took at certain places at certain times—at least the *terminus ad quem* for such a reading, though not normally, of course, the *terminus a quo*. By comparing these patristic readings with similar variants in continuous-text mss, we have some sense as to the age and, though less clearly, the possible provenance of the mss containing them. In general, the more striking or distinctive the readings, the more definite are the conclusions about their date and place of use and perhaps origin. Patristic quotations, therefore, assume very great significance in the effort to establish text types.

Unfortunately, however, the matter is not as simple as this schema suggests. Which manuscripts of the Church Father represent what that author wrote? Indeed, the whole process of textual criticism must be applied to each patristic writing in an effort to establish its original text as closely as possible. Though this has been done for most relevant writings, critical editions still have not been prepared for some; more frequently, though, new critical editions are required that take account of new discoveries and of refinements in method. There is a further difficulty when a canonical text (even if not yet fully defined) is a prominent subject of the early Church writings. The biblical text was well known to the Christian monks (or others) who copied and recopied the mss of the patristic writings, and we can never be certain that what the patristic author wrote has been copied as that author wrote it or whether biblical quotations have been conformed—in the copying process—to the copyist's knowledge or memory of how that text ran in the NT known and used by the scribe and the local community. Of course, this same situation confronts us in the continuous-text mss, but it is heightened in the fathers—where a copyist's main task is the transmission of not the NT text, but the text of the patristic writing. The patristic problem becomes more complex and vexing when passages from the gospels, but particularly the Synoptic Gospels, are involved, for often the author does not indicate which gospel is being cited, leaving open the possibility that the copyist has conformed the citation to a more familiar Synoptic form of that passage. This can happen also when the source of the quotation is given. Naturally, if the patristic writing is a commentary on one of the gospels, some of these difficulties are eased. To take a different example, sometimes an author will cite only the first words of a NT quotation—assuming that the reader will know the rest—but a scribe may fill in the text according to the formulation used locally; or vice versa, the scribe may leave out all but the first words of a familiar passage. As a rudimentary rule, if a quotation differs from the usual forms of the NT—and is not an obvious error—it might gain credence as representing what the author wrote, though such a principle would neither apply to many cases nor by any means be an adequate criterion.

Even more serious problems emerge, for it is not always clear whether an early Christian writer is (a) quoting a NT book directly and exactly as it occurs in the NT text being referenced or, as an alternative, is attempting consciously to quote such a text from memory (a *citation*); (b) is paraphrasing the text, i.e.,

adapting a NT text to the writer's own discussion or syntax while retaining clear verbal correspondence to the Greek NT passage (an *adaptation*); or (c) is merely alluding to a passage by reference to its content but without substantial verbal correspondence (an *allusion*). These questions must be answered in each instance before a patristic quotation can be listed in a critical apparatus of the NT. In the process, each writing must be evaluated further to discover, e.g., its author's citing habits, and a close comparison must be made of varying citations of the same text in the same author. As a rudimentary rule, long quotations are more likely to have been copied from a ms than to have been cited from memory, though the usual transmission hazards indicated above must also be taken into account; at the same time, short or incomplete citations cannot be taken as indicating that the writer's NT text left out the remaining portion of a passage—unless an evaluation of that writer's views makes it highly unlikely that he would have omitted such words were they known to him. An additional complication arises when a writer conflates two or more NT quotations into one.

Ideally, for use in textual criticism, the father's NT text should be reconstructed. In the case of a writer with extensive quotations (like Origen), a running text of that writer's NT (or sometimes NTs), or portions thereof, can be presented, with an apparatus that shows the citations as well as the adaptations and allusions. Then, the resultant father's NT text is compared directly with all major mss and text types to identify the relationship of that father's text to the NT textual tradition as a whole. In the case of writings with few NT quotations and where a running NT text cannot be reconstructed, the individual citations, adaptations, and allusions can merely be listed, showing their agreements/disagreements with the NT ms tradition. (On the terminology and method, see Fee 1971a; 1971b). The Society of Biblical Literature, in a new series, is publishing these kinds of analyses of patristic NT quotations (the first volume is by Ehrman).

Though the process must operate case by case, adaptations and even allusions can at times be more informative about a father's NT text than the citations. Normally, however, only what can reasonably be established as a writer's quotation from a ms lying before him has the fullest weight as a textual reading that can be placed into a variation unit and then employed, with other ms and versional variants, to establish the NT text. Yet apart from their crucial significance in the dating and localizing of certain kinds of variants and textual formulations, patristic quotations do not loom as large as one might expect in the overall establishment of the original text.

Of obvious significance are Greek patristic writers and writings such as the following (dates are often approximate): *Apostolic Constitutions* (380); Apostolic Fathers (Clement of Rome [95], *Didache* [early 2d century], *Epistle to Diognetus* [late 2d century], Ignatius [d. 110], Papias [2d century], Polycarp [d. 156]); Athanasius of Alexandria (295–373); Basil the Great of Caesarea (330–79); Chrysostom (344–407); Clement of Alexandria (d. 212); Cyril of Alexandria (d. 444); Cyril of Jerusalem (315–86); Didymus of Alexandria, "the Blind" (313–98); Dionysius of Alexandria (late 2d century); Epiphanius of Salamis (315–403); Eusebius of Caesarea (263–339); Gregory of Nazianzus (329–90); Gregory of Nyssa (335–94); Hesychius of Jerusalem (1st half of 5th century); Hippolytus of Rome (d. 235); Irenaeus of Lyon (2d century); Justin Martyr (d. 165); Marcion (2d century); Nonnus of Panopolis (5th century); Origen of Alexandria/Caesarea (185–254); Tatian (2d century); Theodore of Mopsuestia (352–428); and Titus of Bostra (d. by 378).

Lists of these and other Church Fathers quoting the NT can be found in Nestle-Aland^{26} (62*) and *UBSGNT*^{3} (xxxvii–xl), a relevent quotations are utilized in the critical apparatus of each; a full, annotated list appears in Aland and Aland 1987: 170–80. An index of biblical citations and allusions has been prepared by the Centre d'analyse et de documentation patristique (Allenbach et al. 1975–87), providing an almost exhaustive list for the first three centuries (with a separate volume on Origen), as well as for Eusebius, Cyril of Jerusalem, and Epiphanius. The apparatus of the American and British Committees' *Gospel according to St. Luke* (1984–87) includes all citations and adaptations in Greek fathers up to A.D. 500, but does not normally record allusions.

2. Versions. If the NT were preserved only in Greek mss and Greek patristic citations of NT passages, textual criticism would be much simpler but also much poorer. Actually, the rich Greek tradition was

expanded during the early centuries of Christianity, not only through the patristic quotations but through the translation of the text into other languages—which in turn was quoted by Church Fathers who wrote in those languages.

The earliest history and actual origins of these translations are obscure. It is clear, however, that the earliest and also the most important were the Latin, Syriac, and Coptic Versions—though not necessarily in that order. During the early centuries of Christianity, the NT circulated and was used in its original Greek dress in Greece, Asia Minor, southern Italy, and in the coastal regions of the Mediterranean Sea in Syria and Egypt—and also rather deeply into Upper Egypt, as recent studies show. Surrounding these geographical districts, however, were areas using different languages: Latin in much of Europe and North Africa; Syriac throughout Syria, including centers like Edessa and Arbela (though Greek was the language of Antioch); and Coptic (in various dialects) in Egypt, and it was inevitable that the spread of Christianity, at an early date, would entail also the translation of the NT into these and other languages.

It cannot be said with certainty whether Latin or Syriac translations were the first to be made; both seem to have originated in the latter part of the 2d century. The gospels were the first to be translated, perhaps into Syriac for Tatian's Diatessaron (a weaving together of the four gospels into a single account about A.D. 170, though its original language has been a matter of debate also), perhaps followed later in the century by Syriac translations of the separate gospels—though these could have preceded the Diatessaron. Or perhaps the gospels were first translated into Latin by missionaries in the late 2d century for use in Latin-speaking sections of the Roman Empire. In any event, versions of the gospels and of other portions of the NT in Syriac, Latin, and Coptic were widely circulated in the 3d century, though the earliest extant manuscripts in these languages are from the 4th century, and the late 4th century at that for the Latin and Syriac versions. (On the versions generally, see Metzger 1977; Aland 1972; Vööbus 1954.)

The use of versional evidence in textual criticism, however, is anything but mechanical; often no one-for-one relationship exists between a reading in Greek and its counterpart in Syriac or Coptic or even in Latin. Differences between Greek and the NT versional languages can be of several kinds, as indicated in the following examples: Syriac, unlike Greek, has no case endings, differs in tense systems, and has no comparative or superlative (Brock 1977). Coptic has no case endings and relies on strict word order to show subject, object, indirect object, and adverb; uses definite/indefinite articles differently; and cannot represent the distinctions between various Greek prepositions (Plumley 1977) (see LANGUAGES [COPTIC]). Armenian presents relatively fewer problems; Greek word order, e.g., can often be preserved precisely, but Armenian lacks the vocative case and grammatical gender; nouns and relative pronouns in some case constructions do not show a distinction between singular and plural; and there is no aorist infinitive or present participle, nor a future tense (Rhodes 1977). In Georgian, Greek prepositions often are not expressed but understood, some prepositions are postpositive, prepositions and postpositives may have several meanings, and there is no definite article as such (Brière 1977; Molitor 1972: 318–25). Ethiopic has no neuter gender and no definite or indefinite article; its verb cannot adequately express time, modal nuances, or the active, passive, or middle voice (Hofmann 1977). Gothic has no future form, prefers a singular demonstrative pronoun even if the Greek has a plural, and a Gothic verbal form may represent two Greek moods or tenses (Friedrichsen 1977). Old Church Slavonic, though it coincides with Greek in most major aspects and allows for a decent translation even on a word-for-word basis, does not have an explicit definite article, has no future tense, and cannot always clearly express the nuances in Greek subordinate clauses (Lunt 1977). Even Latin, which generally provides a fine vehicle for translating Greek, does not differentiate between the aorist and perfect tenses, and has no definite article and no middle voice, among a number of other relatively minor differences (Fischer 1977).

Grammatical and idiomatic factors such as these affect the textual critic's ability to determine what Greek text lies behind particular renderings in these various Versions. Only detailed knowledge of such factors, however, will permit the critic to understand the possibilities in each case or perhaps to realize that no clear determination of the underlying Greek is possible at all.

a. The Syriac Versions. The textual tradition of the Syriac version is complex, though the number of extant mss is very much smaller than, e.g., the Latin version. For the gospels, Acts, and Pauline letters

(the extent of the NT canon in the early Syriac Church), there was an early or Old Syriac form of the tradition, and it survives in continuous-text mss for the gospels but is preserved almost exclusively in patristic quotations by Syriac-speaking fathers for the Acts and the Pauline letters (though these patristic sources have not always been preserved in Syriac itself).

The Old Syriac gospels survive in two forms, each in one ms. The first is the Curetonian Syriac version, named for William Cureton, editor in 1858 of the 5th-century ms in which it is found; its symbol is sy^{c}. The gospels occur in the order of Matthew, Mark, John, and Luke, and about half the text originally in the ms now survives. The second is the Sinaitic Syriac, preserved in a late-4th-century palimpsest ms found in a monastery on Mt. Sinai in 1892 by Agnes Smith Lewis and Margaret Dunlap Gibson. About 85% is extant—though difficult to read—and its symbol is sy^{s}. Whether these two forms of the Old Syriac gospels stem from a common original and represent different developmental stages of that text or are independent translations from Greek into Syriac remains a matter of debate—though the former view is dominant (Metzger 1977: 39).

The commentaries (in Armenian) of Ephraem of Syria (d. 373) are the chief source for the Old Syriac texts of Acts and the Pauline Epistles, complemented by the writings of Aphraates (d. 367) and by such works as the *Liber Graduum* (A.D. 320).

Tatian's Diatessaron of around A.D. 170 could, and quite logically would, have been constructed by using the four separate gospels (or *tetraevangelium*), and that is the view of some; more numerous and more recent scholars, however, contend that the Diatessaron was the first form in which the gospel narratives appeared in Syria. Among the evidence for this latter view are the significant textual differences between the wording of the diatessaron and the Old Syriac gospels—making it difficult to understand how Tatian could have drawn his text from these fourfold or separate gospels. Of course, it is perhaps more difficult still to picture compilers of the separate gospels extracting their materials from the Diatessaron, and yet there are diatessaric elements in the Old Syriac gospels, suggesting that in some way the Diatessaron, developmentally, lies behind the Old Syriac gospels—even if they may have expanded it in accordance with current Greek texts. This is currently the dominant view, though a third option is to argue that the Diatessaron and the Old Syriac gospels were translated from the Greek as independent efforts, based perhaps on differing localized texts from the mid-2d century.

A further debate, relevant to these other questions, concerns the time when the Old Syriac text originated. Since only two mss have survived, it has been difficult to argue that the Old Syriac text was ever an official and canonical gospel text in Syria—would there not, in that case, be more numerous remains? It could, though, be argued that the Old Syriac mss were suppressed once the Peshitta version took over, just as copies of the Diatessron disappeared when the four separate gospels became dominant (early 5th century)—for the Diatessaron has hardly survived in Syriac and our knowledge of it is overwhelmingly from preservation in other languages. If, as seems more likely, the Old Syriac was not an official text in Syria, then perhaps the separate gospels were individual translations made on an ad hoc basis. Such translations—plausibly including the archetype of sy^{s} and sy^{c}—could have appeared in the 3d century, though there is no proof.

Some recent opinion places the origin of the Old Syriac around the mid-4th century—built on the view that the text was based on the Diatessaron and that the Diatessaron held its canonical position as the gospel text in Syria until the time of Rabbula (early 5th century)—this latter view in turn being buttressed by the fact that only two mss of the separate gospels in Syriac have survived. Yet not all scholars have given up the earlier view that the Old Syriac text stems from the end of the 2d century.

So various questions—highly complex and intractable—remain regarding the diatessaron and the Old Syriac gospel text (see Metzger 1977: 3–48; Black 1972; Vööbus 1951; 1954).

Early in the 5th century, someone prepared a Syriac vulgate version, known as the Peshitta ("simple"), whose symbol is sy^{P}, and this revision displaced the Diatessaron in favor of the separate gospels and also replaced the Old Syriac. Whether Bishop Rabbula of Edessa (411–31) made the revision or produced merely a transitional Syriac version along the way toward the Peshitta is not clear, but the Peshitta is preserved in a tight textual tradition in some 350 mss, some as early as the 5th and 6th centuries.

Another Syriac version, the Palestinian (= Aramaic), whose symbol is sy^{pal}, stems from about the 5th century and apparently was translated from Greek independently of the other Syriac versions. Three 11th- and 12th-century lectionary mss survive, as well as a fair number of fragments from continuous-text mss, including small portions of the gospels, Acts, the Pauline Epistles, Hebrews, James, and 2 Peter. The most recently uncovered fragments come from Khirbet Mird, the most extensive of which is a parchment fragment containing Acts 10:28–29, 32–41.

Finally, the complex Syriac textual tradition continued to develop through an early-6th-century version made for Bishop Philoxenus by his chorepiscopus Polycarp in 507/8, which was either reissued by Thomas of Harkel in 616 with marginal notes or was revised by Thomas, again with marginal notes. On the former view, there is only one version involved (the Philoxenian); on the latter view, there are two separate versions, the Philoxenian (sy^{ph}) and the Harclean (sy^{h}). Present evidence indicates that the latter view is correct and that Thomas of Harkel rather considerably revised the Philoxenian version—primarily to bring it into slavishly close conformity with Greek idiom—and also added marginal readings and a critical apparatus that marked off certain readings with obeli and asterisks. This apparatus and the marginalia are by no means fully understood, but at least some of the readings highlighted in these ways represent Greek variants known to Thomas. Whether any Philoxenian mss survive is uncertain; the only ones plausibly defended as Philoxenian contain the Catholic Epistles and the Apocalypse, but these books were not part of the Syriac NT canon and therefore were never quoted by Philoxenus. The only certain remnants of the Philoxenian version would appear to be NT quotations in Philoxenus's *Commentary on the Prologue of John*, recently published. (On the Philoxenian/Harklean problem, see Metzger 1977: 63–75; Brock 1981; VERSIONS, ANCIENT [SYRIAC]).

b. The Latin Versions. The translation of the NT into Latin developed into the most extensive tradition of any NT version, for it existed both in North Africa and in Europe in an "Old Latin" form from the earliest period and then expanded in its "Vulgate" form into a widespread, long-standing, and highly influential ecclesiastical textual tradition.

When and where the Latin version originated are difficult questions. Rome is not the likely place of origin, for Greek was the dominant language there for Christian writings until perhaps the mid-3d century, though Latin began to be used at the end of the 2d century. The earliest extant Christian writing in Latin from Rome, however, comes from the mid-3d century (Novatian). The only plausible evidence favoring Rome as the Latin version's place of origin is the existence there of Christian technical terms in Latin in the first half of the 2d century (e.g., in *Shep. Herm.*). Actually, Tertullian of Carthage in North Africa (ca. 160–220) provides the earliest NT texts in Latin, and Cyprian (ca. 200–58), also of Carthage, evidences the first use of Latin NT mss, though the earliest extant Latin NT mss found anywhere stem from the 4th century. The best judgment, therefore, is that the NT took its first Latin form in North Africa, perhaps in the late 2d century. (See Metzger 1977: 285–90; Fischer 1977: 5–6).

Old Latin mss, exceeding 50 in number, are designated by lowercase Latin letters in italic (*a*, *b*, *c*, etc), which are used for the gospels, then reused for each subsequent section of the NT: Acts, Pauline Epistles, Catholic Epistles, and the Apocalypse. More recently—since the alphabet cannot furnish enough letters—the Vetus Latina Institute at Beuron has assigned an Arabic numeral to each ms. Old Latin mss date from the 4th century until the 13th, indicating the version's longevity and persistence. Vulgate mss exceed 8,000 in number and as many as 10,000 may exist—approaching twice the number of all Greek mss of the NT—and the most important among them are designated by uppercase Latin and Greek letters. They date from the 5th century on.

The Old Latin *(Vetus Latina)* version, with its roughness and diversity of language, was neither a single nor a unitary textual form, but there were several forms or versions, differing according to location. In part, at least, the Old Latin must have originated as a slavish interlinear version of the Greek. The *African Old Latin* form is attested primarily by three relatively old mss (Codex Palatinus [*e* or 2] of the gospels, 5th century; Codex Bobbiensis [*k* or 1] from A.D. 400 with about half of Matthew and Mark; and the fragmentary Fleury palimpsest [*h* or 55] of Acts, 5th century), as well as quotations in Tertullian and Cyprian. It shows greater differences from the Greek tradition than do the European forms, which differ

among themselves as one moves from Italy to Gaul and to Spain. The *European Old Latin* is preserved in far more mss than the African, including several of the 4th and 5th centuries. Currently three groups are differentiated, the term "European" being applied to the first, which includes, for the gospels, Codex Vercellensis (*a* or 3; 4th century); Codex Veronensis (*b* or 4; 5th century); Codex Colbertinus (*c* or 6; 12th/13th century); and Codex Corbeiensis II (*ff*^{2} or 8; 5th century), among others, as well as Irenaeus. The Italian group includes several mss (e.g., gospels: *f* or 10, *q* or 13; Paul: *r*, *r*^{2}, *r*^{3} or 64), as well as the great bilinguals (e.g., *d* or 5, the Latin side of Bezae, and *e* or 50, the Latin side of Laudianus). Finally, a Spanish group has been identified. (See Metzger 1977: 293–330.)

Critical editions of the Old Latin are, for the gospels, *Itala* (Jülicher, Matzkow, and Aland 1954–72) and, for the rest of the NT, *Vetus Latina* (Frede 1962–69; 1975; Thiele 1956–69).

These Old Latin mss, and others like them up through the 13th century, were the NT Scriptures for many Latin-speaking churches over a wide area. The diversity of mss and the generally chaotic state of the early Latin textual tradition were recognized, however, by prominent Church figures in Rome and elsewhere already by the latter part of the 4th century, as evidenced, e.g., by the statement of Jerome (347–420) that every Latin codex seemed to represent a different version and by Augustine's reference to the "infinite variety" among Latin translators. Pope Damasus (366 to 384) took action to correct this situation by asking Jerome to prepare an offical revision of these diverse Latin texts. He himself may only have done the OT, but he or others completed a revision of the gospels in 383, based apparently on European Old Latin mss and a comparison with several Greek manuscripts. From this beginning, the *Vulgate* ("common") text (symbol: vg) developed and assumed its dominant position in the Roman Catholic Church, becoming by decree of the Council of Trent in 1546 the standard text for liturgical purposes.

Some Old Latin mss continued to be copied and used for some centuries after Jerome's time (as noted above), and the Vulgate revision was itself corrupted in its own transmission process by conflation with such Old Latin manuscripts, as well as through the normal scribal alterations, with the result that the Vulgate textual tradition—the more than 8,000 mss and many thousands of patristic quotations—became quite thoroughly mixed and confused. Attempts were made to cut through this confusion by issuing authorized editions of the Vulgate, like those of Pope Sixtus V (1590, the Sixtine edition; symbol: vg^{s}) and Pope Clement VIII (1592; the Clementine edition; symbol: vg^{c1}). In 1899, J. Wordsworth and H. J. White published the first of a three-volume modern critical edition of the Vulgate, whose aim was to recover the revision as Jerome (and his successors) prepared it, and this edition, carried on by others, was completed for the NT in 1954 (Wordsworth and White 1889–1954).

Vulgate mss are too numerous to report here, and their importance for the primary goal of textual criticism consists mainly in the degree to which they preserve Old Latin portions or readings. For Latin Church Fathers, see Aland and Aland 1987: 211–16.

c. The Coptic Versions. The NT in several Coptic dialects is found in various geographical areas of Egypt. Sahidic was the language of Upper (southern) Egypt from Thebes to the south, and the NT in Sahidic (cop^{sa}) dates from the early 3d century. Bohairic was used in the delta region of Lower (northern) Egypt, and NT portions (cop^{bo}) were translated perhaps later in the 3d century. Between these areas, lesser dialects and accompanying translations were to be found, mainly the Achmimic (cop^{ach}), sub-Achmimic (cop^{ach2}), Middle Egyptian (cop^{mae}), and Fayyumic (cop^{fay}).

The Sahidic was known mainly from fragments until the 20th century, when a number of more extensive mss came to light, some as early as the late 3d and early 4th centuries. Its text of the gospels and Acts may be described as possessing both Alexandrian and Western elements, with the former predominating. Bohairic is preserved in many late mss, but early ones are few, though there is an extensive 4th-century copy of John. The Bohairic version generally has greater affinity with the Alexandrian than does the Sahidic in the gospels, and even more so in the Acts.

The Achmimic, sub-Achmimic, Middle Egyptian, and Fayyumic versions are preserved in relatively few documents. There is, however, one extensive sub-Achmimic ms of the Fourth Gospel dating to the early 4th century; there are two extensive 4th- or 5th-century Middle Egyptian mss, one of Matthew

(largely Alexandrian in textual type) and one with half of Acts (with distinctive Western elements); and an early-4th-century Fayyumic ms is extant with a fair portion of the Fourth Gospel. (On the Coptic versions, see Metzger 1977: 99–141.)

d. The Armenian Version. Whether the Armenian version (symbol: arm) was made from Greek or Syriac—the latter is the more recent judgment—is debated, but it seems to have originated in the early 5th century, with a revision some centuries later on the basis of a Greek text. Also debated is whether the Armenian gospels were first in a diatessaron form or were separate gospels. As to its preservation, more Armenian NT mss exist than for any other version except Latin, though none dates prior to the 9th century. The version's textual character is most like the Old Syriac in the gospels, though some have identified it as Caesarean; in Acts and Paul it shows that "midway" character between the Alexandrian and Western. See Metzger 1977: 153–71; VERSIONS, ANCIENT (SYRIAC).

e. The Georgian Version. Opinion is varied as to the basis for the Georgian version—whether Greek, Syriac, or Armenian, or a joint Armenian-Syriac basis—with Syriac and Armenian the two most likely possibilities. Again, some think the Georgian gospels first appeared in a diatessaron form, though perhaps in a non-Tatian form of harmony. There is little doubt, however, about the close affinity of the Armenian and Georgian versions: they are twins whatever their respective origins. Furthermore, two streams have been identified in the gospel texts, an earlier stage (geo^1), found in the Adysh ms, and a later (geo^2), found in the Opiza and Tbet› mss. The latter shows signs of revision on the basis of Greek texts, and its textual character has been called Caesarean. In the Acts, it has been argued that an Old Georgian version existed that was translated from a no longer extant Old Armenian, and that both share a textual complexion like that of the Old Syriac. (See Metzger 1977: 182–98.)

f. The Ethiopic Version. Far more obscure is the origin of the Ethiopic version (eth), but perhaps it came into being in the late 5th or early 6th century. The gospels were translated either from Syriac or Greek, but the Acts, Catholic Epistles—and perhaps also the Apocalypse—doubtless from Greek. The oldest mss predate, at best, the 13th century, and the Ethiopic text is characterized by heterogeneity in the gospels.

g. Other Versions. A number of versions less important for NT textual criticism but cited occasionally in the critical apparatus are the *Arabic* (arab), *Nubian* (nub), *Persian* (pers), and *Sogdian* (a Middle Iranian language) in the East; and the *Gothic* (goth), *Old Church Slavonic* (slav), *Anglo-Saxon*, and *Old High German* in the West. (See Metzger 1977: 257–81; 375–459.)

D. History of the NT Text and Critical Editions

This vast store of sources—Greek mss, patristic quotations, versions—must be evaluated, sorted, and somehow marshaled in the reconstruction of the earliest attainable form of the Greek NT text. That process began, presumably, with the first copyist of a NT text who—out of a conscious interest in improving it—pondered a change in the text being copied, for at that point an alternative reading was being assessed. It is Origen of Alexandria/Caesarea (185–254), however, who marks the first documented use of text-critical principles when, in his commentaries, he refers to NT readings that are supported by "few," "many," or "most" mss accessible to him. He is followed by Jerome (347–420), who took note of variant readings, considered an older ms to carry more weight than a recent one, and preferred readings that best suited a passage's grammar or context. In the Renaissance, Lorenzo Valla (1407–57) collated some Greek NT mss and pointed out involuntary and voluntary scribal alterations, and Erasmus (1466–1536) observed thousands of textual variations in preparation for his edition, which became the first published Greek NT (1516). It was based on several minuscule mss, primarily Minuscule 2, supplemented by no. 1. This was the beginning of the printed editions, and it was quickly followed by the Complutensian Polyglot in 1522 (whose Greek NT portion had already been printed in 1514, though not published). Numerous editions succeeded these earliest two, including notable ones by Robert Estienne, also known as Stephanus (four editions, 1546–51); Theodore Beza (nine editions, 1565–1604); and the Elzevir brothers (seven editions, 1624–78), whose second edition of 1633 contains the famous phrase *textus receptus* in their statement in the preface, "You have the text now received by all."

A new, lengthy, and productive period began when Brian Walton placed variant readings from Codex Alexandrinus at the bottom of the pages of the Greek text in his Polyglot Bible (1655–57) and additional readings in an appended critical apparatus. Alexandrinus, which had come to light in 1627, was assigned the symbol "A" by Walton and was a major factor in the now increasing activity of collecting variant readings and displaying them in critical editions of the textus receptus. John Fell's 1675 edition presented variants from mss and versions exceeding (so was his claim) 100 in number. A giant step was taken by John Mill's 1707 folio Greek NT (which printed the 1550 Stephanus text), for its extensive apparatus encompassed more than 31,000 readings for more than 21,000 variation units. The sheer size of this body of variants raised disturbing questions about the validity of the textus receptus; beyond that, in his prolegomena and textual notes Mill enunciated several important text-critical principles, including the judgment that the more obscure a reading, the more authentic, and he implied that genealogical relationships may exist between mss. For his achievements, Mill appropriately may be called the founder of modern NT textual criticism.

These collections and displays of variant readings met their share of severe criticism, but there was now no way to stop the increasingly sophisticated movement to explore the available textual evidence for the Greek NT. Indeed, plans to supplant the textus receptus now became deliberate, most notably in Richard Bentley's preparations for an edition that would present the text of Origen's time ("the true exemplar of Origen"); his 1720 *Proposals for Printing* this Greek/Latin NT explained that he intended to employ the oldest uncials and the patristic and versional evidence of the first five centuries. Unfortunately, he never carried out his ambitious plan, though its influence—through the principles enunciated—was significant nonetheless. Others accelerated the process that slowly but surely was undermining the textus receptus, and they did so in two ways: by forming new critical texts through choices among the myriad readings and—more important—by developing rules or "canons" for selecting those readings. Notable are two such proposals for new editions that appeared in the decade following Bentley's 1720 statement. In 1725, J. A. Bengel published a "Prodromus" ("forerunner") to his edition and in 1730 J. J. Wettstein's *Prolegomena* appeared. Bengel's critical edition did not appear until 1734 and Wettstein's two large volumes not until 1751–52, and when they did, surprisingly the resultant text of neither scholar followed the noble canons of criticism they proclaimed in their proposals—for they both largely stayed with the textus receptus. Yet their canons were to have far-reaching influence. Bengel asserted that "the harder reading is to be preferred" (usually expressed as *difficilior lectio potior*) and that ancient witnesses are to be preferred; in 1742 he listed 27 canons in his famous *Gnomon.* Wettstein asserted 19 canons, among them that the reading in clearer Greek is not necessarily preferable; the fuller, more ample reading is not preferable to the shorter; a reading conformable to the style of the author is preferable; the more ancient reading is preferable; but the more orthodox reading is not necessarily preferable.

Though the principles of Bentley, Bengel, and Wettstein were not consistently carried through by any one of them, they were to bear fruit in the landmark Greek NT of J. J. Griesbach in 1775–77. He enunciated 15 canons, including many of those championed by Bengel and Wettstein. Griesbach gave most weight to his first canon, which in brief states that "the shorter reading … is preferable to the more verbose," though he carefully qualifies and elaborates it by specifying, e.g., that the reading in question must be supported by the "old and weighty witnesses," must suit the author's style, and must not show influence from a parallel passage, etc. He also prefers the more difficult reading, the harsher reading, the less orthodox reading, etc. What is more important, however, is that—unlike his three predecessors—Griesbach put his critical principles into practice, though still with considerable restraint. The result was that Griesbach's edition made the first significant break with the textus receptus. Yet this was only a cautious and measured departure from the received text of long standing, for, while Griesbach's text departed from it at many points, the textus receptus was still there as the textual base being manipulated.

Actually, it took some 50 years more to reach a clean, clear, and decisive break with the textus receptus—in the sense that the NT text would now be formed entirely from the most ancient witnesses available rather than from previous printed editions. It was Karl Lachmann who achieved this in his edition of 1831. His aim was to formulate the text as it had existed just prior to A.D. 400, and his bold

method was to lay aside the entire established traditional text and to draw his own text from the oldest Greek uncials, the Old Latin and Vulgate, and some early fathers such as Origen, Irenaeus, and Cyprian.

The succeeding period produced our modern editions of the Greek NT, based on the general principles exemplified by Lachmann, and also brought an increasing flow of new mss. Constantine Tischendorf was prominent in both endeavors, for he produced eight editions of the NT (1841–72) and nearly two dozen volumes publishing new mss. The rationale for his editions was that the text "should be sought solely from ancient witnesses" and must "arise from the witnesses themselves …, not from the edition of Elzevir, which is called 'received' " (2d ed. of 1849). He goes on to say that the mss "that excel in antiquity prevail in authority" and that the foundation of all canons is this: "More probable than others is the reading that appears to have occasioned the other readings." His eighth major edition of 1869–72, with the indispensable "Prolegomena" by C. R. Gregory (1894), was the last large-scale critical edition of the entire NT to be produced (except for that of H. von Soden [see below]), and it is still in use for its vast treasury of textual readings, though in many serious ways it is thoroughly out-of-date (e.g., he cites, about six times, only one papyrus, P^{11}). Tischendorf's text, though important both for utilizing all of the newly found materials and for furthering the triumph over the textus receptus, was not long in use, for the Westcott and Hort text of 1881 and the Nestle text of 1898 (and its successive editions) were much more widely used in parish and in scholarship.

Tischendorf's other monumental contribution was his discovery and publication of significant NT mss. Not only did he find and rescue Codex Sinaiticus—the dramatic story is well known—but he discovered 18 uncials and 6 minuscules and edited or redited some 36 other mss.

S. P. Tregelles in 1854 published canons of criticism along the same lines as Lachmann and Tischendorf, producing a Greek NT between 1857 and 1872. Meanwhile, over a 20-year period, B. F. Westcott and F. J. A. Hort had been preparing a new critical text with an extensive introduction, which appeared in 1881–82. The very title of their work, *The New Testament in the Original Greek,* shows that their goal was far more ambitious than those of Bentley or Lachmann—who wanted to establish the 3d- and 4th-century texts, respectively—for Westcott and Hort sought and claimed to be reproducing the original text itself. How they formed their text, however, is more important than their audacious claim. In short, Westcott and Hort (though Hort actually wrote the introduction) argued that four types of text existed or developed in the first centuries of Christianity, which they called "Neutral," "Alexandrian," "Western," and "Syrian." The so-called Neutral, they argued, is represented by the great 4th-century uncials, Vaticanus and Sinaiticus, but can be traced back to the mid-2d century. The Alexandrian represents the refinement of an essentially Neutral kind of text—a polished version—and is found in codices C, L, 33, the Coptic versions, and Alexandrian fathers such as Clement and Origen. The so-called Western kind of text, they argued, reaches back as far—perhaps further—than the Neutral and is represented in Bezae and Claromontanus and can be documented in early fathers (e.g., Marcion, Tatian, Justin, Irenaeus, Cyprian) and early versions (especially the Old Latin and Curetonian Syriac). Finally, the Syrian (which we now call Byzantine) is a later text that has developed from the conflation of readings found in the earlier text types. Westcott and Hort rather dramatically documented such conflation in test passages and argued, further, that the Greek and Latin fathers up to the mid–3d century support one or another of the pre-Syrian texts but do not support the conflate readings or other distinctively Syrian readings. A major conclusion was that the Syrian text had not yet been formed by the mid-3d century and that of the other three that lay behind it, the two oldest were competing texts in the earliest traceable period: the Western and the Neutral. (The Alexandrian text, since Westcott and Hort, has generally been classified with the Neutral, though the term "Alexandrian" has been retained to describe the combined entity.)

The question that remained for Westcott and Hort concerned which of these earliest pre-Syrian text types (Neutral or Western) represented the original, since both—according to them—had 2d-century claims. There was no way by which Westcott and Hort could bring their historical reconstruction to reveal—on historical grounds—which of the two was closer to the original NT text. That is to say, they admitted that genealogical method—which, in the rather loose fashion that they applied it, had shown the

Syrian text to be later—could not break the impasse. How was it to be broken? Actually, seeds of the solution were already evident in the way that the Western text had been described by Hort—a text given to paraphrase and corrupt in other respects. Hence, when seeking an escape from the historical reconstruction that found two very early texts in competition with one another, the Neutral and the Western, Hort relied on subjective evaluations and on internal criteria. These internal considerations involve, first, the internal evidence of readings, i.e., consideration of individual readings in terms of (a) intrinsic probability (what the author most likely wrote) and (b) transcriptional probability (what the scribe most likely wrote); when both methods certify the same reading, it may with certainty be accepted as the most probable, but transcriptional probability is decisive when the two approaches are in conflict. Second, the internal evidence of documents considers each individual group of readings that makes up a ms so as to acquire "knowledge of documents," namely, that ms's general quality and reliability. In ths way the weight of a ms's readings can be assessed when the internal evidence of (individual) readings is unclear. Third, the internal evidence of groups considers a single group of mss so as to determine its overall character as a bearer of generally reliable documents—in comparison with other groups.

This strategy pushed to the background the later, smoother, critically edited text with conflated readings, namely, the Syrian, and it pushed aside the early, paraphrastic, nearly always corrupt text that was fond of assimilation, namely, the Western Text. At the same time, however, it brought to the forefront the oldest and "best" (i.e., the purest) mss and the "best" groups of mss, those witnesses which—as Westcott and Hort saw it—had virtually escaped corruption and contamination and which they—understandably—called "Neutral." Vaticanus, Hort asserted, "very far exceeds all other documents in neutrality of text …, being in fact always or nearly always netural" (2.171), with Sinaiticus next in purity, and these mss, by virtue of being both close in time and closest in quality to the original text of the Greek NT, were taken by Westcott and Hort as fair representatives of that text.

A major effect of the Westcott and Hort scheme and of the text it produced was the thorough rout of the textus receptus—a general equivalent of their Syrian text. Though Lachmann, Tischendorf, Tregelles, and others had displaced the textus receptus by asserting the logical authority of the older witnesses, it was Westcott and Hort who provided an impressive and consistent demonstration of how and why this later, fuller text developed from the older—their loosely genealogical explanation of the patently observable conflation process. In this and other ways, Westcott and Hort set the stage for the 20th-century agenda in NT textual criticism.

Westcott and Hort's claim to have the NT "in the original Greek" amounted, of course, to overkill, and the very strategy that led to this claim was quickly attacked at various vulnerable points—leading the discipline during the first half of the 20th century into a fascinating period of new explorations and of speculative historical reconstructions. For example, Westcott and Hort's negative valuations of the Byzantine (= Syrian) text and the Western text were viewed by many as excessive. Some sought to redeem Byzantine readings—and indeed the entire text—from their now harshly negative status. The most extreme form of this attempted rehabilitation came from J. W. Burgon (1883; 1896), who turned the Westcott and Hort reconstruction on its head and counterattacked with vehement, acrimonious, and abusive charges against what he saw as their malicious intention to undermine the text of long standing and to replace it with their "scandalously corrupt" mss—Vaticanus and Sinaiticus (1883: 16). A more reasoned defense of Byzantine readings was made by F. H. A. Scrivener (1894), who also published numerous mss and collations.

As for the Western text, Westcott and Hort's harsh judgment about its extensive corruption—while claiming at the same time that its readings were perhaps the earliest documentable NT readings—provided a challenge: Were these early Western readings, rather than the Neutral, really the original ones? As a result, not only were individual Western readings claimed to be original, but some argued that the Western text of Acts in general was original (e.g., A. C. Clark in 1933), and Fr. Blass in 1896 (1898: 96–164) asserted that both the Western and Neutral texts were original in Luke–Acts, claiming that Luke wrote two versions of each book, one represented by the Western, the other by the Neutral. More significant, some of the witnesses assigned by Westcott and Hort to the Western text were soon

recognized to be disparate and divergent rather than homogeneous. When new discoveries brought to light such mss as Washingtonianus and Koridethi and the Sinaitic Syriac, a new, separate text type was identified two generations after Westcott and Hort: the Caesarean. This text type, however, was soon divided into two phases, a primitive, pre-Caesarean stage (P^{45}, W [in Mark after 5:30], f^{1}, f^{13}) and a recensional, Caesarean text proper (Codex *theta*, 565, 700, arm, geo, Origen^{part}, Eusebius, Cyril^{Jer}). This understanding of the Caesarean text enjoyed widespread support for nearly 50 years, but during the past 15 years or so the Caesarean text appears to have been breaking up. While W and P^{45} (in Mark) form a textual group (with other supporting witnesses), that group is not related significantly to the witnesses il the later Caesarean proper group, so the former should no longer be called "pre-Caesarean." In fact, the P^{45}-W group appears to be a separate group that stops with W and leads no further; nor does it have a significant relationship with either the Alexandrian or the so-called Western texts, nor with the Byzantine. As for the Caesarean text proper, recently *theta* has been shown to agree only about 40% with Codex W and, e.g., to agree nearly 50% with Codex D, which would make *theta* more "Western" than "Caesarean." The result has been to question not only the existence of a "pre-Caesarean" text of the gospels, but also of a "Caesarean" text in general (see Hurtado 1981; cf. Epp 1974: 393–96.)

Critical editions continued to appear after Westcott and Hort, including those of R. F. Weymouth (1886), B. Weiss (1894–1900), the British and Foreign Bible Society (1904, with a 2d ed. by G. D. Kilpatrick in 1958), A. Souter (1910, rev. ed., 1947) H. J. Vogels (four eds., 1920–50), A. Merk (nine eds., 1933–64, revised 1965), and J. M. Bover (five eds., 1943–68). H. Greeven produced a new text of the Synoptic Gospels in 1981.

Some large-scale critical editions appeared following Westcott and Hort. From 1911–13, H. von Soden undertook the prodigious task of classifying the massive body of Byzantine mss into manageable groups and assessing their character. Many minuscules were first collated for his edition, which encompassed the entire NT, and his meticulously detailed discussions are still valuable, as is the ms evidence in his critical apparatus. Yet his division of all witnesses into three recensions and his preference for readings supported by two gave prominence to Byzantine readings in his critical text—which therefore moved against the stream of critical opinion from Bentley on. Second, S. C. E. Legg produced a critical apparatus of Mark (1935) and Matthew (1940). In 1948–49, the International Greek NT Project (= American and British Committees), a joint British-North American endeavor to present not a critical text, but a critical apparatus, of the NT, began work on Luke—taking up the task after Legg's publications—and produced an apparatus in two large volumes in 1984–87, which offers the textual evidence from the eight papyruses that have portions of Luke, from 62 uncials (out of 69 containing Luke), from 128 minuscules (methodically selected from nearly 1,700 extant for Luke), and from 41 representative lectionary mss, as well as evidence from all Greek and Latin Church Fathers up to A.D. 500 and from selected Syriac fathers, and from the following Versions: Latin, Syriac, Coptic, Armenian, Georgian, Ethiopic, Gothic, and Old Church Slavonic, as well as the Arabic and the Persian versions of the Diatessaron. Since then the project has begun work on the gospel of John.

Meanwhile, Eberhard Nestle produced a hand edition of the Greek NT (12 eds., 1898–1923), and this "Nestle" edition was subsequently edited by his son, Erwin Nestle (13th–20th eds., 1927–50), and by Kurt Aland (21st–25th eds., 1952–63), then coedited with Barbara Aland beginning with the 26th ed. (1979). Hence, this hand edition is popularly known and cited as Nestle-Aland^{26}. The text of the 26th edition is identical with that of the *UBSGNT*^{3} (1975), edited by K. Aland, M. Black, C. M. Martini, B. M. Metzger, and A. Wikgren, whose first edition appeared in 1966 and which has an accompanying *Textual Commentary* prepared by Metzger (1971). The earlier Nestle editions formed the NT text by choosing readings supported by two of the following editions: Tischendorf, Westcott and Hort, and Weymouth (but Weiss after 1901). The more recent procedure has been to construct the text without reference to earlier editions. The Münster Institute for NT Textual Research (founded and directed by Kurt Aland, and since 1984 by Barbara Aland) maintains the official registry of mss and also the most complete files of ms copies, which constitute the main resource for the Nestle-Aland and *UBSGNT* editions, as well as for a new major critical edition under way at the Institute.

E. Contemporary Theory in NT Textual Criticism

The preceding historical sketch of the development of critical texts leads naturally to current theoretical issues in NT textual criticism. First, the long-standing question of text types has not been resolved to everyone's satisfaction and remains a major issue.

1. Text Types. Though there is not complete agreement about the configuration of the NT text in the first few centuries, it can be argued plausibly that three textual clusters or constellations can be identified in reasonably separable groups, and that each finds its earliest representatives in papyrus mss and then carries on to one or more major uncials (cf. Epp 1989c). (1) First, the clearest cluster can `e identified in the P^{75}-Codex B line (with P^{66}, Sinaiticus, and, e.g., the later L, 33, 1739), namely, an Alexandrian kind of text, which might be called the *B text group.* (2) Second, three or four papyruses and one uncial prior to the 4th century (P^{29}, P^{48}, P^{38}, 0171, and perhaps P^{29}) form a cluster that can be related to Codex D (and later with 1739 in Acts, and 614, 383), namely, what has long been called—though incorrectly in the geographical sense—the Western kind of text, which might better be designated the *D text group.* (3) Third, a cluster can be identified in P^{45} and Codex W (with, e.g., f^{13}), which might be called the *C text group* because it stands midway between the B and D text groups (but no longer to be called Caesarean). (4) In addition, though not among the early clusters and therefore with no early papyrus representatives, there is the later Majority or Byzantine text group, whose earliest major witness is Codex A (though only in the Gospels). Therefore, this might be called the *A text group* in recognition of Codex Alexandrinus. This cluster does have supporting witnesses among the papyruses, but only from the 6th (P^{84}), 7th (P^{68}, perhaps P^{74}), and 7th/8th centuries (P^{42}).

Whether all of these clusters can properly be called text types is—and will be—much debated. A text type may be defined as an established textual cluster or constellation with a distinctive character or complexion that differentiates it from other textual constellations. Such differentiations are based not on general impressions or on random samples, but on a full quantitative comparison of agreement/disagreement in variation units (or test readings when large numbers of manuscripts are being considered). "The quantitative definition of a text-type is a group of manuscripts that agree more than 70 per cent of the time and is separated by a gap of about 10 per cent from its neighbors" (Colwell 1969: 59).

No one doubts that the Byzantine (the A text group) is a genuine text type, beginning in the 4th century and carrying on in the ms tradition even beyond the invention of printing. It is also plausible, though not all agree (e.g., Aland and Aland 1987: 50–71), to argue that the other three textual constellations constitute three distinguishable text types as early as the 2d century and following (with the C text group, however, ceasing with Codex W).

Attempts to identify and clarify text types have been prominent since Bengel divided all NT witnesses into three families, and text types were a major preoccupation in the differing reconstructions of Westcott and Hort and von Soden, but especially in the period that followed. It will and must remain a major item in the discipline's agenda. (See below; cf. Epp 1989a: 97–100; 1989c.)

2. Canons/Criteria of Criticism. In the preceding historical sketch, the gradual emergence of critical "canons" or criteria for determining the most likely original readings can be observed, and various examples have been noted along the way. These canons go back at least as far as Gerhard von Mastricht in his Greek NT of 1711. Now they are usually divided into two categories: *external criteria,* those appealing to the nature of mss and to historical factors in the transmission process; and *internal criteria,* those appealing to scribal habits, contexts of passages, and the author's style, language, and thought. They can be summarized as follows (from Epp 1976a: 243), with each criterion phrased in such a way that if it accurately describes a textual variant, there would be a presumption (other things being equal) to regard that variant as the most likely original reading in its variation unit:

A. *Criteria related to external evidence*

1. A variant's support by the earliest mss, or by mss assuredly preserving the earliest texts
2. A variant's support by the "best quality" mss
3. A variant's support by mss with the widest geographical distribution

4. A variant's support by one or more established groups of mss of recognized antiquity, character, and perhaps location, i.e., of recognized "best quality"

B. *Criteria related to internal evidence*

1. A variant's status as the shorter or shortest reading in the variation unit
2. A variant's status as the harder or hardest reading in the variation unit
3. A variant's fitness to account for the origin, development, or presence of all other readings in the variation unit
4. A variant's conformity to the author's style and vocabulary
5. A variant's conformity to the author's theology or ideology
6. A variant's conformity to Koine (rather than Attic) Greek
7. A variant's conformity to Semitic forms of expression
8. A variant's lack of conformity to parallel passages or to extraneous items in the context generally
9. A variant's lack of conformity to OT passages
10. A variant's lack of conformity to liturgical forms and usages
11. A variant's lack of conformity to extrinsic doctrinal views

These criteria are employed with various degrees of decisiveness and in varying combinations in all current methodologies in NT textual criticism. For example, while the external criteria are emphasized in the historical-documentary approach, the internal criteria receive almost exclusive emphasis in the rigorous eclectic method. The third basic method, reasoned eclecticism, compromises and uses a combination of the two kinds of critical canons (see below).

Anyone attempting to employ them will recognize, however, that their use is highly complicated and that in the final analysis, determinations are made on the basis of a "balance of probabilities." For example, often the criteria will compete with one another: one or more canons will accredit a reading while other canons discredit the same reading; or different canons at the same time will accredit two or more competing readings in the same variation unit; or external criteria may support one reading, while internal criteria support another, etc. Moreover, as noted earlier, the "shorter reading" canon has been called into question in recent times, and it is clear that not all carry the same weight. It might be suggested that the canons be rank-ordered and judgments made on the basis of the applicable canon with the highest priority. Discussions of this type generally—though not always—come to the same conclusion that Tischendorf reached: the only criterion that can clearly claim priority is that the reading is to be preferred that best explains the origin of all other readings in the variation unit. Most recently, K. Aland has called this the "local genealogical method" (Nestle-Aland^{26}: 43*).

3. Basic Text-Critical Methods. Current approaches to the establishment of the most likely original NT text may be reduced to the three basic methods mentioned above, though a brief summary can hardly do justice to the complexities involved in each.

a. Historical-Documentary Method. In an ideal text-critical world, this method would be largely adequate by itself, for it attempts to reconstruct the history of the NT text by tracing the lines of transmission back through the extant mss to the earliest stages and then selecting the reading that represents the earliest attainable level of the textual tradition. The NT text-critical world, of course, is not ideal, and the matter is not as simple as this schema suggests. Yet in theory we should be able to organize our extant mss into groups or clusters, each of which has a similar kind of text (as sketched earlier). As a result of this process, we should be able to isolate the earliest known groups. Then we should be able to identify other groups that can be arranged in an identifiable chronological succession—that is, later groups. If only one very early group or cluster were to emerge, that would simplify matters a great deal, for it could be claimed with a high measure of legitimacy that this earliest type of text is closest to the original. Or, to view the matter at the level of readings, within each variation unit the reading would be selected that comes from that earliest cluster, again with a plausible claim that it represents the original reading.

This—though much oversimplified—is the traditional method of external or documentary textual criticism, so named because it emphasizes external criteria, including the age and provenance of a

document, as well as the general quality of its scribe and its text. This could be called the "historical-genealogical" method, but—unlike textual criticism in the classics—strict genealogical procedures (establishing stemmata of manuscripts) is not feasible in NT textual criticism, for there is too much textual mixture in the complex array of mss (Colwell 1969: 63–83; Birdsall *CHB* 1: 317). So a name that emphasizes history and documents makes "historical-documentary" an appropriate designation for this idealistic method.

The historical-documentary method ascribes a major role to the earliest papyruses and uncials—that group prior to the 4th century—for these mss, many discovered only recently, provide for the first time a genuine opportunity to assess and to reconstruct the history of the NT text in those crucial one and a half to two centuries preceding the great uncial codices. Unfortunately, this earliest group of mss does not reveal one earliest cluster or type of text, but a spectrum of readings that do not easily lend themselves to grouping. Yet the task, though elusive, is not impossible (see "Text Types" above).

Also prominent in this method is the quantitative measurement of ms relationships, in which the total agreement/disagreement between and among a sizeable number of mss can be measured and displayed—largely a development since the 1960s (Duplacy 1975; Colwell 1969: 56–62; Fee 1968a; 1968b; 1971a; Wisse 1982; McReynolds 1979). This controlled and precise quantitative methodology is indispensable in establishing ms relationships and is used also to determine textual affinities of patristic writings and of versions.

b. Rigorous Eclectic Method. Those who employ this method rely largely, primarily, or exclusively on internal criteria for resolving text-critical problems and for establishing the original text. It is also known as "rational criticism" or "thoroughgoing eclecticism" by its proponents, and stems from the work of C. H. Turner (1923–28) and M.-J. Lagrange (1935: 17–40). In practice, the variant is selected that best suits the context of the passage, the author's style and vocabulary, or the author's theology, while taking into account also such factors as scribal habits, including their tendency of conformity either to Koine or to Attic Greek style, to Semitic forms of expression, to parallel passages, to OT passages, or to liturgical forms and usage. Internal canons of these kinds take precedence over the external ones—sometimes to the virtual exclusion of the latter. "The decision rests ultimately with the criteria as distinct from the manuscripts" and "each reading has to be judged on its merits and not on its [documentary] supports" (Kilpatrick 1943: 25–26; 1965: 205–6), for "we are concerned with which reading is likely to represent what our original author wrote. We are not concerned with the age, prestige or popularity of the manuscripts supporting the readings we would adopt as original" (Elliott 1974: 352), and "it seems to be more constructive to discuss as a priority the worth of readings rather than the worth of manuscripts" (Elliott 1978: 115; cf. 1972). It has been characteristic of rigorous eclectics, among whom G. D. Kilpatrick and J. Keith Elliott have been the most consistent, to scrutinize and accredit Byzantine readings that pass the internal criteria tests, and not to attribute any special character, value, or authority to the early papyruses or uncials simply because of their age.

c. Reasoned Eclectic Method. The third method combines these two approaches, drawing from both—that is, relying on the balance of probabilities arising from the application of all relevant canons—external and internal. This is the method adopted and employed day-to-day by the vast majority of NT textual critics, and it was the method used, in general, to form the text common to the Nestle-Aland[26] and the *UBSGNT*[3]. When one is faced with any variation unit, the variant reading would be chosen that appears to be in the earliest chronological group and that makes the best sense when the internal criteria are applied. If no one textual group can be identified unambiguously as the earliest cluster, then the variant would be chosen that is in one of the earliest groups and that best satisfies the relevant internal considerations. This method acknowledges the reality that no single criterion or invariable combination of criteria will bring resolution in all cases of textual variation, so it applies evenly and without prejudice any and all canons—external and internal—that are appropriate to a given instance, and then seeks an answer based on the balance of probabilities among the applicable criteria. Though it is impossible to generalize, external criteria probably have a slight edge among practitioners of this method, though perhaps the variant that can explain all the others in a variation unit would assume the highest priority in those cases where such a

variant can clearly be identified. This generalization seems to be substantiated as one analyzes the rationale for a large number of the decisions made for the *UBSGNT,* as described in Metzger's *Textual Commentary* to that edition.

The nature of this method suggests that the term "reasoned eclecticism" is most appropriate, though it might be called "moderate," for it goes to neither extreme in using the canons, or "genuine" eclecticism, for it employs criteria from both groups and therefore the best available principles from across the methodological spectrum, or it might be called simply the "eclectic" method, though this unmodified term no longer sufficiently discriminates it from the rigorous eclectic method. (On eclectic methods, see Fee 1976; Epp 1976a.)

F. Conclusion

NT textual criticism has a long, fascinating, and distinguished history, revitalized at point after point by new and striking discoveries that have generated fresh theoretical formulations. Its practitioners have not been reluctant to reconsider established conclusions, abandon them, and move in new directions. The present situation is one in which agreement on many important aspects of the NT text's history and on methods for reconstructing the most likely original text is still elusive. Prominent areas of debate are the existence and nature of early text types, the relative weight and appropriate use of the various canons of criticism, and the most effective way to utilize the earliest papyruses and uncials in the two problem areas just mentioned, but also in the general search for the original text of the NT.

ELDON JAY EPP

TEXTUAL GLOSSES. See GLOSSES, TEXTUAL.

TEXTUS RECEPTUS. The name given to the form of biblical text actually used in a community and regarded by the members of that community as authoritative. The term literally means "received text," and it originated with the publisher's claim made for the 1633 Elzevir edition of the Greek NT, *Textum ergo habes nunc ab omnibus receptum* ("Now, then, you have a text received/accepted by all").

The production of a completely uniform text available to all members of a community was made possible by the invention of printing. The most careful copying could not prevent the development of some variation during the process of manuscript transmission. Such variation in the text of the Hebrew Bible was kept to a minimum by the Masoretic control of its transmission, so the textus receptus of the Jewish Bible is, in effect, the first fully satisfactory printed edition of the Hebrew Bible, the Venice edition of 1524–25 printed by Daniel Bomberg. The Greek and Latin texts of the Bible, with their more complex history, took somewhat longer to reach the stage of universal acceptance. This was finally achieved for the Latin text (the Vulgate) with the Clementine edition of 1592. For Western scholars, the Sixtine edition of 1587 became the textus receptus of the Septuagint.

These early editions were simply printed imitations of the best manuscript copies of the day. Thus Jacob ben Hayyim, the editor of the Hebrew textus receptus, produced a typical Masoretic Text, with vowel and

accent signs, *masorah magna, masorah parva,* and a form of the *masorah finalis.* See MASORETIC TEXT. In addition, he printed the standard Targum beside the Hebrew text, and grouped the most highly regarded rabbinic commentaries around them. In this format, as well as in its text, his edition set the standard for later editions prepared for Jewish scholars, known generically as *Miqra᾽ōt gĕdolōt.*

The Venice edition of 1524–25 was generally recognized as the best available text of the Hebrew Bible for all purposes until the beginning of the 20th century. Scholars had by then recognized the importance of the earliest traditions, representing the self-consistent work of a single Masorete, for the study of the history of the text. This resulted in the printing of the text and Masorah of the Leningrad codex, a good representative of such a tradition, in the third edition of Rudolph Kittel's *Biblia hebraica* (1937). Such editions have now superseded the textus receptus in the study of the earlier history of the text of the Hebrew Bible, and in research dependent on the early form of the text.

E. J. REVELL

THADDEUS (PERSON) [Gk *Thaddaios* (Θαδδαιος)]. One of the twelve disciples of Jesus (Matt 10:3; Mark 3:18). In Matt 10:3 variant readings include "Lebbaeus" or "Thaddeus, surnamed Lebbaeus." The name is omitted from the Lukan lists of apostles (Luke 6:14–16; Acts 1:13), where the name "Judas son of James" is inserted instead. If Luke's name is correct, the descriptions "Lebbaeus" and "Thaddeus, surnamed Lebbaeus" may have been added to avoid confusion with Judas Iscariot the traitor. They may be based on *leb* ("heart"), the Hebrew root of "Lebbaeus," and be a term of endearment. The reference to Judas, not Iscariot, in John 14:22 probably refers to Thaddeus. See JUDAS (PERSON). No other person in the NT named James can be identified with any certainty with James the father of Thaddeus.

In extracanonical literature, Thaddeus healed, preached to, and converted persons in Edessa in Mesopotamia. The story is preserved in the Greek and Syriac versions of the *Acts of Thaddeus* and an earlier account by Eusebius (*Hist. Eccl.* 1.13; 2.1. 6–8). Eusebius also mentions Thaddeus as one of the Seventy (1.13.4, 11; cf. Luke 10:1).

THAMUDIC LANGUAGE. See LANGUAGES (INTRODUCTORY SURVEY).

THANKSGIVING. Greek words derived from the root *eucharist-* are used in the NT almost exclusively in the sense of thanksgiving directed to God (in the LXX the verb and substantive do not occur in the Hellenistic sense until the apocryphal writings). The only exceptions are Acts 24:3 and Rom 16:4, although cf. 2 Cor 1:10–11. On Luke 17:16 cf. v 18.

A. Thanksgiving at Meals

It was the custom of the Jews to praise God for each dish (cf. *t. Ber.* 4:1; *b. Ber.* 35a). This expressed their sense of dependence on God's gifts in creation. Festive meals were opened by the master of the house with a grace said over the loaf of bread before it was distributed. The meal ended with a benediction over the cup of wine. Both actions are expressed by the Hebrew *berak* or the Aramaic *berek.*

1. The Prayer of Thanksgiving at the Last Supper. This is referred to in the Pauline tradition of the Last Supper (1 Cor 11:24) and in Luke (22:19) by the participle *eucharistēsas,* whereas in Mark (14:22) and in Matthew (26:26) it is expressed by *eulogēsas.* Both these verbs are translations of *berak/berek,* but *eulogein* seems more appropriate and is already used in LXX for *berak.* However, it should be noted that Aquila also uses the term *eucharistia* in the sense of "praise"—always for *tôdâ:* Pss 25(MT 26):7; 41(MT 42):5; 49(MT 50):14; 68(MT 69):31, etc. In Rom 14:6 and 1 Cor 10:30 *eucharistein* is used in connection with food (cf. 1 Tim 4:3–4). Thus praise and thanksgiving are inseparable (cf. below). In any case *eucharistein* used absolutely, without object or subordinate clause, obviously comes from a Semitic background.

The act of praise at the end of the meal is referred to in Mark 14:23 and Matt 26:27 (cf. Luke 22:17) by the participle *eucharistēsas.* This is a stylistic variant for the act of praise *(eulogēsas)* mentioned at the beginning of the meal. In Luke 22:20 and 1 Cor 11:25 *eucharistein* is implied by the word *hōsautōs* (cf. Luke 22:19; 1 Cor 11:24).

2. Thanksgiving in Jesus' Miraculous Feedings. It is often supposed that in the narratives of the miraculous feedings the words chosen for the introductory actions of Jesus echo the tradition of the Lord's Supper. But Mark himself shows in 8:14–21 a paraenetic interest in the feeding stories which does *not* appear to be oriented toward the Lord's Supper (cf. also 6:52). Nor in 6:41 does he assimilate the description of the opening actions of Jesus at the meal to the traditions of the Lord's Supper as it appears in 14:22.

On the other hand, Mark 8:6 shows a striking agreement with Luke 22:19 (cf. also 1 Cor 11:23–24). The inescapable conclusion is that the tradition of the Lord's Supper utilized by Paul has influenced the *pre-Markan tradition* of the Feeding of the Four Thousand. Since v 7 interrupts the context, it is possible to reconstruct a pre-Markan version of the story which features only the bread. This would link it with the Lord's Supper, so making the miraculous feeding an allusion to the community celebration. The *Kyrios* acts as host to those who are "afar off" (cf. v 3b) and to those who are near (Eph 2:17). The fish were added later and assimilate the story to the Feeding of the Five Thousand. Thus the eucharistic associations of the original story were suppressed in order to emphasize the miracle.

In the *pre-Markan tradition behind Mark 6:35–44* the fish motif cannot be eliminated (vv 38, 41, 43). The phrases expressing the actions are unlike any known eucharistic tradition. As a result there is no obvious reference to the Lord's Supper.

In Matt 14:15–21 the fish motif recedes into the background to some extent, but it is not completely eliminated (cf. vv 17 and 19). True, the terminology describing Jesus' action (note the word *klasas,* v 19, which deviated from Mark) conforms to some extent to the tradition of the Lord's Supper. But the forms of the verbs and the references to Jesus' looking to heaven are also points which differ from the supper tradition. Thus Matthew does not intend to establish any close connection between the Feeding of the Five Thousand and the Lord's Supper (cf. also 16:5–12). Rather, he was unconsciously influenced by some features of the supper tradition.

In the Feeding of the Four Thousand (Matt 15:36) Matthew follows Mark in his description of the preparatory actions of Jesus (Mark 8:6–7). By including the fish in the opening act of praise (unlike Mark, v 7) Matthew is following his practice, noticeable elsewhere, of shortening Mark's material. The finite verb *elaben* (instead of the participle *labōn* in Mark 8:6b) is determined by the participle at the beginning of v 35 (in v 6a Mark has a finite form of the verb). There are no signs of any influence of the Pauline tradition of the Lord's Supper (1 Cor 11:23–24) on Matthew any more than there is on Mark.

In Luke's version of the Feeding of the Five Thousand (though cf. Luke 9:13, 16) the fish motif is soft-pedaled. This may be explained by the fact that in 9:12–17 Luke combines Mark 6:35–44 and Mark 8:1–9. The Evangelist made no attempt to conform it to his version of the supper tradition. In particular he has not taken over *eucharistēsas* in v 16 (cf. Luke 22:19) from Mark 8:6. Luke's concentration on the bread is not so much the sign of any interest in the community celebration as of his intention to represent the meal, beginning as it does with the breaking of the bread and a special prayer, as generally typical of Jesus (cf. Luke 24:30–31, 35). In any case it is worth noting that only Luke speaks of Jesus' *eucharistein* in connection with his final Passover (22:17, 19), whereas for other meals *eulogein* is used (9:16; 24:30). The difference is intentional. For Luke, *eucharistein* was obviously a term associated with the Lord's Supper.

In the Johannine version of the Feeding of the Five Thousand we find in 6:11 agreements with 1 Cor 11:23–24 (cf. also Luke 22:19). The reference to the breaking of the bread is missing; the writer is content with *eucharistein.* The agreement already noted with the supper tradition in Paul and Luke can be traced back to the Johannine tradition. The Evangelist uses the Feeding of the Five Thousand to introduce the bread discourse, which has obvious links with the Lord's Supper (cf. esp.6:51–58, but also vv 27, 32–35. This suggests that John himself also understood the feeding narratives in a eucharistic sense, especially if

he is responsible for the bread discourse in its present form. The timing in 6:4 (near the time of the Passover) and the mention of Judas in 6:64, 70–71 (cf. 13:2, 21–30 as well as 1 Cor 11:23) are further pointers to the Lord's Supper (13:1ff.). Finally, in 6:51c John shows affinities to 1 Cor 11:24 and Luke 22:19, which suggests that this version of the supper tradition was known in the Johannine community. Even if John 6:51c–58 is assigned to the post-Johannine redactor, the Feeding of the Five Thousand was in any case understood in a eucharistic sense. *Eucharistein* (21:13, however, occurs only in the Western texts) had associations with the Lord's Supper. This may also be suggested by the redactional notice in John 6:23, if textual criticism allows us to take the final genitive absolute as part of the original text.

3. Christian Thanksgiving at Meals. In Rom 14:6 and 1 Cor 10:30 Paul presupposes that grace before meals was said in Christian households. The context of 1 Cor 10:26–30 makes it clear that the Jewish custom of grace before meals was taken over and practiced in a way which everyone could recognize. Rom 14:6 emphasizes the community-building character of the table prayers addressed to the one Creator God. The Christian who eats everything thanks God for the food, while the vegetarian Christian gives thanks likewise for what he or she receives. It is therefore wrong to despise or judge the other person (v 3).

In contrast to the prayers of heretical asceticism, 1 Tim 4:3–5 emphasizes the way in which the saying of grace before meals acknowledges that food is the gift of God's creation and therefore good. It is thus "consecrated" as though by God's word of creation.

In Acts 27:35 Luke describes how Paul behaved in a way similar to Jesus at the Lord's Supper (Luke 22:19). The word *eucharistein* occurs here. The addition of the indirect object *tō theō* (cf. Luke 17:16; 18:11), as in the phrase "in the presence of them all," underlines the character of this action as a public confession. Luke is not describing a celebration of the Lord's Supper, for Paul starts eating alone, without distributing to the others. These, who take their food after him, are mostly non-Christians (vv 36–37). But the explicit use of eucharistic terminology makes Paul's meal a transparent reminder of the Lord's Supper. It strengthens the believers in the hour of trial and enables them to confess their faith and to help their fellows.

B. The Prayer of Thanksgiving in Worship

1. General Considerations. The grace before meals is addressed to God and is marked by praise and thanksgiving (1 Cor 14:16; 2 Cor 9:12–13; cf. also Rom 1:21; Rev 4:9; 7:12). It had a recognized place in the worship of the early Christian community (cf. 1 Cor 14:16–17; Col 3:15–17). An individual could recite it in the form of glossolalia (1 Cor 14:16–17). Its focus was the saving act of God in Christ (2 Cor 4:14–15; Col 1:12ff, 2:6–7; 3:17; Eph 5:20). The goal of Pauline missionary work is to make this prayer of thanksgiving universal (2 Cor 4:15). Revelation finds the archetype of the Church's praise and thanks addressed to Christ in the worship of heaven (Rev 4:9; 7:12; 11:17). The community's thanksgiving may also focus upon a particular benefit it has received from God (2 Cor 1:11; 9:11–12), and thanksgiving should be a feature of all prayer (Phil 4:6; 1 Thess 5:17–18; Col 3:15–17; 4:2). Thus, according to 1 Tim 2:1, worship features not only a prayer of intercession for the whole world but also a general thanksgiving.

2. At the Celebration of the Lord's Supper. In early Christian communities there were special prayers of thanksgiving in connection with the Lord's Supper. The formulation *to potēron tēs eulogias ho eulogoumen* (1 Cor 10:16a) employs the regular term for the final cup of the meal, *kos shel berakah,* and adapts the verb accordingly. This suggests that there was a specifically Christian prayer of thanksgiving which was recited before the administration of the cup. Since the phrase "the bread which we break" (1 Cor 10:16b) implies the prior recitation of a prayer of praise (cf. Mark 14:22; 1 Cor 11:24), the breaking of bread must have been preceded by a corresponding Christian prayer. 1 Cor 10:16 therefore presumes that thanksgiving has preceded the distribution of bread and wine, thanking God additionally for granting participation in Christ's saving death (cf. *Did.* 9:2–4). This in fact seems to be the way in which the anamnesis command of 1 Cor 11:24–25 and Luke 22:19 was put into effect. Paul must have this in mind when he speaks of "proclaiming the Lord's death" in the Lord's Supper (1 Cor 11:26). These prayers of

thanksgiving gave such a powerful imprint to the celebration that it was later called *eucharistia* (*Did.* 9:1, 5; Ignatius, *Phila.* 4:1; *Smyrn.* 7:1; 8:1; Justin, *Apol.* 66:1).

C. Personal Thanksgiving

1. Overview. The basic attitude of everyone vis-à-vis his or her Creator should be one of gratitude and praise (Rom 1:21). This is the Christian alternative to silly talk or levity (Eph 5:4). But it can also be misused as a cloak for self-righteousness (Luke 18:11). When God hears our prayers this too can be an occasion for thanksgiving (John 1:41). There are other occasions for prayer, as when Paul successfully averts a misunderstanding of baptism (1 Cor 1:14–15), or when his converts display a rich variety of spiritual gifts. He is particularly grateful for the existence and growth of Christian congregations (Acts 28:15; 1 Thess 2:13; 3:9; 2 Thess 2:13).

2. Introductory Thanksgivings in the Pauline Letters. Paul often speaks of giving thanks in his prayers for the recipients' growth in faith. This usually comes immediately after the prescript: Rom 1:8; 1 Cor 1:4; Phil 1:3; Col 1:3; 1 Thess 1:2; Philemon 4. Some of the Deutero-Paulines adopt the same practice: Eph 1:16 (following an introductory eulogy); 2 Thess 1:3; 2 Tim 1:3. Exceptions occasioned by the current situation are found in 2 Corinthians and Galatians. In the Deutero-Pauline 1 Timothy and Titus there are no initial thanksgivings (cf., however, 1 Tim 1:12–14).

The mention of thanksgiving for the recipients was not an invariable feature for letters in antiquity or late antiquity, whereas in the Pauline letters their occasional omission is always for good reason. The regularity with which the apostle expresses his thanks and praise in his letters shows his basic gratitude, his consciousness that it is only by God's grace that he is a successful and responsible proclaimer of the gospel. For the purpose of the thanksgiving is usually to bring home to the recipients their close ties with the apostle and make them realize that their growth in faith is a gift from God. Thus Paul encourages them to practice their faith in ever-growing measure until the Parousia. That is also why he introduces in the exordium of his letters themes that will be important later in the letters. The thanksgiving in Rom 1:8ff is rather different; its purpose is to gain favor with his readers.

There are differences in the length and structure of the thanksgivings. These variously reflect the specific situation of each letter. The following points are important to the apostle: (1) His gratitude is constantly integrated into his prayers for the strengthening of his readers' faith (Rom 1:9–10; Phil 1:3–4; Col 1:3; 1 Thess 1:2–3; Philemon 4; further Eph 1:15–16). Also to be seen in this light is 1 Cor 1:4 (cf. further 2 Thess 1:3). (2) Paul's gratitude arises from the faith of the community which the gospel has produced (Rom 1:8–9; 1 Cor 1:4–6; Phil 1:3–5; Col 1:3–6; 1 Thess 1:2–6; 2:13; Philemon 4–7; also Eph 1:15–19; 2 Thess 2:13–14; 2 Tim 1:5). (3) Paul focuses on the future eschatological orientation of faith (1 Cor 1:7–9; Phil 1:6; 10–11; 1 Thess 1:9–10; 3:13; cf. also 2 Cor 1:9b, 14; further 2 Thess 1:5–10; 2:13–14).

D. Conclusion

In NT usage *eucharistein/eucharistia* expresses the way in which gratitude to God for Christ's saving work and for the life of faith is a characteristic feature of Christian existence. For further discussion see *TWNT* 9: 397.13–405. 25 and *EWNT* 2: 219–22; *John* AB, 231; *John* HTKNT, 15; *1 Corinthians* THKNT 7/2: 60–62.

CHRISTIAN WOLFF
TRANS. REGINALD H. FULLER

THANKSGIVING HYMNS (1QH). Among the Essene writings found by the Ta'amire bedouin in Qumran Cave 1 were two leather packages that were stuck together. At one time they had formed a single leather scroll. Along a circuitous route these materials came into the possession of the Hebrew University, where they were opened and edited under the auspices of E. L. Sukenik (1955). These texts consisted of nonbiblical hymns, which the editor designated as *Hodayot* or songs of praise, because of their frequent use of the formula "I shall praise you, Lord" (siglum: 1QH^{a}). Two additional fragments (siglum: 1QH ^{b}) were published as *1Q35* frs. 1+2 in *DJD* 1: 136–37. The first part of 1QH ^{a} to be opened was preserved on three sheets and later reconstructed as cols. 1–12 (sheet I = cols. 1–4; II = cols. 5–8; III = cols. 9–12). Roughly one third of the original 35–40 lines of the three sheets belonging to this first leather package was either damaged or completely destroyed. The second part contained a number of fragments that were difficult to arrange. The reconstruction of cols. 13–18, using this material, excluded 66 fragments. The editing disclosed large gaps, and the sequence of the columns was uncertain. For that reason J. Carmignac offered a new arrangement of the available textual material, including fragments that had not yet been taken into consideration (cf. the precise chart in Carmignac 1961: 281).

Among materials from Cave 4 there were further fragments of at least 6 *Hodayot* mss (4QH $^{a–e}$ and pap4QH^{f}), which testify to a different arrangement of the songs (cf. Strugnell 1956: 49–67). Aided by these parallel texts, H. Stegemann reconstructed a new edition of the text having 24 columns. This reconstruction preserved a partially new arrangement (cols. 17, 13–16 before col. 1; in the editio princeps col. 17 was incorrectly collated) and included most of the fragments that had not yet been integrated into the text (Stegemann 1963; cf. recently Puech 1988: 59–88). A complete and final edition is still not available.

Several scribal hands are evident in the *Hodayot* manuscripts. In the editio princeps the end of the first manuscript appears at col. 11:22 (middle). The so-called second hand continued from 11:26 to the end of col. 18. The lines between 11:22 and 28 reveal a third hand at work (cf. Martin 1958, 1: 59–64). All three hands represent the Herodian script, particularly in its middle and late phases (cf. Cross 1961: 180; Avigad 1965: 76f; Birnbaum 1971, 1: 155).

Linguistic studies have shown that the language of the *Hodayot* is based on biblical Hebrew. Yet there are elements of Palestinian Aramaic and Late Hebrew as well as Samaritan influences. Characteristic of these songs is above all the liberal use of *scriptio plena.* Peculiarities can be seen in the suffix endings on verbs and nouns (e.g., in 2d-person masculine singular verbs: *-tâh;* in nouns indicating the 2d-person masculine singuline: *-kâh*); the loss of laryngeals, chiefly *ʾalep* and *he;* the elision of *he* in the infinitive construct; and even the quiescent *ʾalep.* Compared with the MT, there are several new words and a few syntactic peculiarities (in addition to the introductions in the commentaries, cf. esp. Mowinckel 1956:

265–76; Silberman 1956: 96–106; Goshen-Gottstein 1958: 103–12). Such orthographical, grammatical, and syntactic features link the *Hodayot* to the other writings associated with the Qumran community.

Analyses of each songs' *Gattung* quickly revealed that this was a collection of "songs of praise" similar to the psalm tradition in the OT (cf. Carmignac 1961: 130ff.). As was the case with the OT Psalms, different types of songs could be found among the *Hodayot.* Based on their structure, A. Dupont-Sommer observed that a community must have stood behind some of the hymns, while behind others there was evidence of a particularly strong, single personality (1957: 7). In a thorough analysis of their individual elements, G. Morawe divided the songs into "thanksgiving songs of the individual" and "hymnic confessions" (1960, see esp. the chart on p. 166). This classification was frequently criticized and elaborated upon. G. Jeremias (1963: 170) and S. Holm-Nielsen (1968: 124ff.) viewed cols. 1, 9:37b, and 10:1–12 (Holm-Nielsen added to this list 7: 26–33 and col. 13) as an independent literary type, designating them as "hymns." In these hymns the splendor of creation and of God's omnipotence were praised.

The reports concerning distress and deliverance belong to a type called "thanksgiving songs of the individual," which are also preserved in the individual thanksgiving songs of the OT (cf. Gunkel and Begrich 1985: 265–92; for the *Hodayot*, see the summarizing chart in Morawe 1960: 133–35). Unlike the biblical Psalms, however, the theme of deliverance from sickness or distress does not predominate in the Qumran hymns. Rather, the concern is God's salvific action with respect to the mediator of his revelation, who has had to endure persecution because of his message (cf. Jeremias 1963: 170). The "I" of the one praying is individual and personal. Behind this "I" a historical person of significance for the community is discernible. He is usually identified with the "Teacher of Righteousness" (cf. Dupont-Sommer 1950: 86; 1957: 10–12; Jeremias 1963: 174–77; more restrained is Bardtke 1956: 220–33; 1956–57b: 93–104; Morawe 1960: 170–71, n. 2; Holm-Nielsen 1960: esp. 170 and 347; Hempel 1962: 281–374), and the songs are termed "songs of the Teacher."

The "hymnic songs of confession" are characterized especially by hymnic sections, contemplation, soteriological statements, and meditations on human misery. The "I" of the one praying is no longer an individual, but rather a collective that includes every member of the community. Therefore, these songs were also designated as "songs of the community."

Scholars have not given a unanimous answer to the question about the historical context out of which the *Hodayot* arose. Except for statements about their function, which are only very general, the songs themselves preserve no concrete instructions regarding particular cultic occasions. One must also consider the fact that the Qumran community no longer participated in the cult of the Jerusalem temple, but had discovered new oral forms for praising God (cf. Becker 1964: 129ff.; Klinzing 1971: passim, esp. 11–20). Consequently, it is not surprising that the Sitz im Leben was sought in other communal situations. The *Hodayot*'s didactic style and characteristic wisdom speech permit one to imagine a catechetical and meditative usage (Bardtke 1956: 220–33, esp. 230; cf. Maier 1960, 2: 64; Dupont-Sommer 1957: 8. [in partial agreement]). Yet the vague indicators in the songs (1QH 3:23; 11:13; 12:3–11) or even in the other writings (1QS 10:9f.) point positively to a communal use in the worship of God (cf. Holm-Nielsen 1960: 332–48). Relying on Philo's description of the Egyptian Therapeutae (*Vita Cont.* §§27, 29, 80, 83–84), several scholars have argued that the Sitz im Leben is to be found in the common singing and praying of the community's members (Dupont-Sommer 1957: 8; Carmignac 1961: 135; Reicke 1955: 37–44; Delcor 1962: 24–26). In contrast to these views, H.-W. Kuhn has postulated the entrance into the covenant (i.e., the annually recurring covenant festival) as a concrete occasion for the use of these songs. He bases his conclusion on the following elements: soteriological statements, doxologies dealing with the baseness of humankind, and meditations on human misery. It is also possible, Kuhn contends, that the community could have used these songs for their daily periods of prayer, as suggested in 1QS 10:10: "with the coming of the day and the night I shall again enter into God's covenant" (Kuhn 1966: 29–33). The approach taken by Kuhn with respect to the songs of the community commends itself also for nuancing the use of the songs of the Teacher. It should also be asked in which communal situations the distress and deliverance reports could have been spoken, prayed, or sung. The mere presence of the songs of the

Teacher in a collection with the songs of the community suggests that the community had adopted, and adapted, the songs which had originally been composed by, and been applicable to, a single individual.

Even if the *Hodayot* are in form prayers and songs, they do preserve implicitly or explicitly some traces of the theology of the Qumran community. That does not mean, however, that these hymns offer the material for a closed and unified systematic theology. Their different forms, different authors, and the probable lengthy span of time during which they were written suggest that one should expect divergent shapes and emphases (cf. the still optimistic view of Licht 1956: 1–13, 89–101). Based on this premise, a few characteristics can now be presented.

(1) One must start with the formula "I shall praise you, Lord," or, less often, "Blessed are you, Lord," which shows these texts to be songs of praise and thanksgiving. In terms of content, they include God's works of creation, his salvific actions, and his judgments. In all of these actions, God's mercy is revealed to the one praying (cf. 10:14), his truth and righteousness (cf. 4:31; 11:7; 14:16). God's uniqueness, omnipotence, and holiness are indisputably certain for the one praying and form the prerequisite foundation for his anthropological, soteriological, and ecclesiological ideas.

(2) In the statements about the baseness of humankind and observations on human misery found in the hymnic songs of confession, which are also discernible in the thanksgiving songs of the individual, a picture of humanity is recognizable that is characterized by the conviction of the absolute nothingness, sinfulness, and thus the forlornness of all human beings. Expressions like "a thing formed of clay" (1:21; 3:23 passim), "a thing shaped out of dust" (18:31; frgs. 3, 5, 14), or "a thing molded out of water" (1:21; 3:24passim) appropriate OT ideas about creation, but go far beyond the latter by associating such phrases with ethical qualifications, e.g., "quintessence of shame" (1:22), "source of impurity" (1:22; 12:25). These expressions allow one to recognize an irreconcilable contrast between the nature of God and humankind (cf. Lichtenberger 1980: 77–87). In the reports of distress found in the songs of the Teacher, biographical reports that depict attacks and violent measures directed against the mediator of God's revelation dominate. These reports lead on to a similar complaint about the vanity and hopelessness of the human condition.

(3) The soteriological statements present a response to the hopelessness of human existence as an inescapable predicament. God has placed his spirit within the one praying (12:11; 13:19; 17:26; cf. in the songs of the Teacher (4:31; 7:6), granted him knowledge (13:13; cf. also 11:27) and insight (14:8, 13), taught him (11:9–10), purified him of wickedness, sanctified him from impurity (11:10; cf. also 2:21; 7:30; 11:30), and delivered his soul (3:19–20). God is therefore the sole actor. In contrast, human beings are only capable of receiving and accepting.

(4) The result of crossing over from the sphere of calamity into the realm of salvation is entrance into the congregation of angels and the community of holy ones (cf. 3:21–22; 11:11ff.; 14:18) or membership in "your [God's] covenant" (cf. 4:19, 24; 5:9) for the purpose of common jubilation and praise (3:21; 11:13). Analogous statements announce that the pious believe as much in a present salvation as they do in an eschatological one (3:21; 11:11ff.; cf. also 6:34). In these statements deliverance is interpreted as a new creation with respect to an eternal congregation.

The certainty of already participating in the eschatological salvation is documented in the constant use of the OT—above all the Psalms (cf. Holm-Nielsen 1960: 301–31; Carmignac 1960b; Jeremias 1963: passim). Thus the writings of the OT are not simply understood as linguistic aids, but serve rather to present the claim that the speaker is living in the age of fulfillment and completion (cf. 1QpHab 7:2–4). Accordingly, the perspective of these songs can be stated as follows: they present a new, completely genuine form of speech which represents the language humans will possess in God's new creation (cf. esp. 1:27c–31a). Therefore, these songs of praise represent the community's genuine response to God's creation, his acts of deliverance, and his judgments.

Is this the Qumran community? Individual hymnic sections of other Qumran writings undoubtedly demonstrate shared themes with the *Hodayot.* For example, 1QS 10:9–11:22 preserves comparable theological, anthropological, and soteriological conceptions. Furthermore, the *pesharim*, especially the *pesher* on Habakkuk and the *pesher* on Nahum, with their concrete references to the "Teacher," his

community, and his opponent, appear to be a clear commentary on the reports of distress in the songs of the Teacher (cf. Carmignac 1960a).

From this one can conclude that originally at least the core of these songs derived from the Qumran community. The composition of the majority of these songs should be dated at the beginning of the history of the Qumran community, ca. the middle of the 2d century B.C.E. Some hymns or parts of the songs could be older and could have arisen in the circles called "Hasideans" in 1 Macc 2:42 and 7:13. These circles were no doubt the predecessors of the Qumran community.

TRANS. PHILLIP R. CALLAWAY

THANKSGIVING, THE PRAYER OF (NHC VI,*7*). The title assigned to what has come to be identified as the seventh tractate in codex VI of the collection of 4th-century Coptic manuscripts discovered in 1945 near Nag Hammadi in Egypt. The text, which is nearly perfectly preserved, extends from line 33 of page 63 to line 7 of page 65 in the codex. The Coptic dialect of NHC VI is Sahidic, with some Akhmimic and Subakhmimic variants.

The title is modern and derives not from the manuscript itself but from the nature and content of the text. Instead of a title, *Pr. Thanks.* is furnished with an incipit (63.33), "This is the prayer that they spoke," which is bracketed by the scribe with the scribal decoration typical of titles in the Nag Hammadi codices. Together with the reference at the close of *Pr. Thanks.* to the participants' ritual embrace and departure to a sacred meal (65.2–7), the incipit provides the narrative framework to the prayer which forms the body of the work. The incipit indicates, moreover, that *Pr. Thanks.* was not here intended to be a completely independent work but rather an appendix to the preceding tractate, the Hermetic *Discourse on the Eighth and Ninth* (NHC VI,*6*). In this tractate the deifying knowledge of God for which the prayer gives thanks is revealed by Hermes to his disciple, ostensibly the "they" of the incipit to *Pr. Thanks.*, and the subject of hymning God occupies much of the discussion.

Pr. Thanks. is consequently designated Hermetic. This identification is strengthened by the fact that a Latin version of the prayer was previously known from the close (section 41) of the Hermetic dialogue preserved in Latin under the title *Asclepius* (though *The Perfect Discourse* was the title borne by the Greek original), a Coptic version of a portion of which (sections 21–29) follows *Pr. Thanks.* in NHC VI. Before the discovery of *Pr. Thanks.*, a second (Greek) version of the prayer was known from an adaptation in the magical papyrus called Mimaut after its original owner (Louvre, Paris, #2391), column XVIII, lines 591 through at least 609. The original Greek version ultimately underlying all three extant adaptations was probably composed in the 3d century, and probably in a Hermetic context, though not necessarily as part of *The Perfect Discourse*. The Coptic *Pr. Thanks.* is likely to date from the 4th century.

Pr. Thanks. attests to the influence of Greek philosophical concepts on the pagan hymnody of late antiquity and the increasingly transcendent view of God which it encouraged. The same influence was making itself equally felt in Christian settings and accounts for the attraction that *Pr. Thanks.* must have held for its Christian readers, despite its pagan origin.

HOWARD JACKSON

THARRA (PERSON) [Gk *Tharra* (Θαρρα)]. The eunuch who, along with Gabatha, conspired against King Ahasuerus (Add Esth 12:1–2). In the MT, the two co-conspirators are named, respectively, Teresh and Bigthan (a) (Esth 2:21; 6:2). When Mordecai overheard their plot, he informed the king (in the MT he used Esther as an intermediary); Tharra and Gabatha were subsequently hanged. In the plot of the Gk version (unlike that of the MT), Mordecai's actions were immediately rewarded by Ahasuerus. The Gk version also uses the occasion to introduce a motif not found in the MT account: Haman hated Mordecai because the latter had informed on the two eunuchs, implying that Haman was secretly sympathetic to the plot to assassinate Ahasuerus.

GARY A. HERION

THASSI. The nickname of Simon, the second son of Mattathias (1 Macc 2:3), and the founder of the Hasmonean dynasty. For the nicknames of Mattathias' sons see GADDI (PERSON). There is no convincing explanation for the meaning of "Thassi," and even the reading is contested by several scholars, on the grounds of various readings such as "Tharsi," "Thatis," or conjectural "Thadsi." The most similar Hebrew root is *tss,* "to boil, to ferment," but it does not help in giving any sense to the word. We tend to agree with J. Goldstein (*1 Maccabees* 231), "that speculation is futile as to the origin of the nickname."

THEATER. See ART AND ARCHITECTURE.

THEBES (PLACE) [Heb *nō› ›āmôn* (נֹא אָמוֹן)]. Greek designation (at least as early as Homer) of the second most populous and important city in Egypt after Memphis, located on the Nile ca. 225 km N of Elephantine and ca. 700 km S of the Mediterranean (25°42′N; 32°37′E). (The precise derivation of the name is in doubt, but it is generally agreed that some Egyptian appellative which sounded like "Thebes" suggested the application of the toponym to the Greeks.) The 4th township of Upper Egypt, in which Thebes was located, was called *Wese,* and this term was also frequently applied to the city; otherwise it went under the names of its various parts or its geographic location, such as *Ipt-swwt,* "Most Select of Places" (modern Karnak); *Ipt-rsit,* "Southern Select [place]" (modern Luxor); *Djēme,* (modern Medinet Habu); and *niwt rsit,* "The Southern City." From the end of the New Kingdom it was also called "the city of Amun" after the city's principal god, whence the Hebrew *Nō› (Amôn)* (from Egyptian *niwt,* "city"; Nah 3:8; Ezek 30:14–16) and Greek *Diopolis* ("city of Zeus"). Thebes straddles the Nile at a point where the alluvial plain broadens to a width of ca. 9 miles and thus provides the region with moderate productivity in crops. The ruins of the ancient city cover, on both banks, an area of ca. 16–18 square miles, and because of sparse occupation over the last 1,500 years many ancient buildings have survived (in contrast to Memphis or Alexandria).

Paleolithic occupation in the area is attested by flint assemblages in the adjacent western desert, and a settlement from the late predynastic has been revealed by excavation on the W bank of the Nile; from that period occupation has been uninterrupted. By the early Old Kingdom villages dotted the broad alluvial plain on both banks, and the practice had begun of locating the necropolis in the Sahara cliffs bordering the valley of the Nile on the west. Though mentioned as a district capital along with its local god Montu, and in receipt of occasional votives from the Memphite kings, Thebes under the Old Kingdom (ca. 3000–2200 B.C.) never achieved political importance; and it was not until the collapse of the 6th Dynasty (ca. 2200–2180 B.C.) that the city springs to prominence as the seat of an energetic family of nomarchs. Under the Antefs of the 11th Dynasty Thebes welded the seven southernmost townships of Upper Egypt into a rebel kingdom, defied the legitimate 10th Dynasty at Herakleopolis, and provoked a protracted civil war. Montu-hotpe 1 (ca. 2060–2010 B.C.), victorious in the struggle, turned Thebes into his capital and lent a degree of monumentality to the erstwhile village by erecting his imposing tomb-cum-mortuary-temple on the W bank in a valley called "The Most Holy," modern Deir el-Bahari. The 12th Dynasty (ca. 1991–1776 B.C.), although they ruled from a new capital at Lisht, between Memphis and the Fayum, were Theban by birth and never ceased to adorn the city with memorials. Senwosret I (1971–1926 B.C.) began the nucleus of the present temple at Karnak on the E bank, probably as a royal chapel (largely of mud brick) dedicated to the local deity Amun ("the hidden one"), whose origins are obscure. (Some cultic structure had stood on the spot in the 11th Dynasty, but its nature and plan are unknown.) Under the peaceful rule of the 12th and early 13th dynasties the temple became the repository of steles, votive statuary, vessels, jewelry, and sundry treasures, all dedicated by reigning kings to the great "Amun-re" who, through royal patronage, had been exalted to the status of "King of the Gods, and who is over the Two Lands (i.e., Egypt)." The city of mud-brick houses surrounding the temple grew phenomenally, extending far to the E, N, and S of the present-day temenos. The city may have suffered during the first half of the 17th century B.C., as

excavation shows a destruction and abandonment; and inscriptional evidence suggests that it barely survived the depredations of the Hyksos.

The New Kingdom (ca. 1550–1076 B.C.) was a halcyon time for Thebes. The 18th Dynasty, which had expelled the Hyksos, originated in Thebes, and although they preferred a N residence, they maintained close ties with their place of origin. At least once a year they repaired S for festival, and vast quantities of booty from the foreign wars were bestowed on the temple of Amun. Thousands of war prisoners, many from Palestine, were employed in the construction of tombs and temples. Most important, the 18th Dynasty (followed by the 19th and 20th) considered Thebes the family burying ground: from ca. 1540 B.C. a line of mortuary temples celebrating the cult of deceased kings took shape on the W bank, and from Thutmose I's reign (1525–1514 B.C.) royal burials were secreted in shaft tombs in a desert valley known today as the Valley of the Kings. Thutmose I restored the Amun temple at Karnak and his grandson Thutmose III (ca. 1504–1451 B.C.) enlarged it and dug the sacred lake. Amenophis III (1419–1382 B.C.) added the Third Pylon to the front of the temple, and rebuilt the temples at Luxor and Montu. The Amarna pharaohs (1382–ca. 1350 B.C.) added a number of buildings along the axis of the temple, but their work was dismantled and their masonry reused by Horemheb in his enlargement of the Amun complex. Sety I (1321–1304 B.C.) completed the great hypostyle hall and the Second Pylon, and his son Rameses II (1304–1234 B.C.) finished the decoration and enlarged the Luxor temple.

In the process Thebes became a monumental memorial commemorating the empire which Egypt had created in Asia and the Sudan. Among those records germane to biblical studies recovered from the ruins and from excavation one may cite the following: (1) itineraries (ostensibly lists of "conquered places") in Palestine and Syria, the most important being those of Thutmose III or the Sixth and Seventh Pylons (*ANET*, 242–43); (2) the extracts of the royal daybook detailing the Asiatic conquests of Thutmose III (*ANET*, 234–41); (3) the reliefs and inscriptions describing Akhenaten's introduction of monotheism; (4) the war reliefs depicting the campaigns of Sety I and Rameses II in Palestine and S Syria on the external walls of the hypostyle, the Luxor temple, and the Rameseum; (5) Rameses II's treaty with the Hittites (*ANET*, 199–201); (6) the "Israel" stele of Merenptah (ca. 1225 B.C.), on which the name "Israel" first occurs in hieroglyphs (*ANET*, 376–78); (7) literary and administrative papyri and ostraca; (8) the inscriptions of Rameses III at Medinet Habu describing the invasion of the Sea Peoples (*ANET*, 262–63); and (9) the triumphal inscription of Sheshonk I commemorating his invasion of Judah and Israel.

At its height Thebes comprised several foci of settlement centering upon major temples and connected by broad sphinx-lined avenues. On the E bank the central settlement lay in and around Karnak with its temple to Amun and subsidiary shrines for Khonsu (the moon), Montu (the hawk-headed god of war), Ptah, and Osiris. One km S was the complex of the mother-goddess Mut and Khonsu-the-child, while 3.5 km farther S was the Luxor temple ("southern Ope") with its temple to Amun and the king's spirit. On the W bank the major centers were (from S to N): the great palace and commercial harbor of Amenophis III; the mortuary temple of Rameses III at Medinet Habu; the town of the necropolis workers at Deir el-Medina; the Rameseum of Rameses II; the "valley" with temples of Montuhotpe I and Queen Hatshepsut; and the temple of Sety I at Qurneh. The city was administered by two majors, one for the E bank and one for the W; but the high priest of Amun exercised jurisdiction over both the vizier for Upper Egypt was often in residence.

With the death of Rameses XI (ca. 1070 B.C.) Thebes ceased to enjoy a direct connection with the royal family, who used Tanis both as residence and burying ground. The city shrank in population and became merely the provincial headquarters of the high priest of Amun (who often refused to reside there). An abortive rebellion (ca. 835–825 B.C.) against the Libyan 22d Dynasty ruling in the N brought reprisals and furthered decline. From ca. 711 to 525 B.C. the city experienced a revival and considerable growth, as it was favored by the Amun-worshipping Sudanese kings of the 25th Dynasty; and it became the capital of princesses of the reigning house, who filled the office of "Divine Adoratress" of Amun and ruled from Asyut to Elephantine. Thebes was sacked by the Assyrian army in 663 B.C., and suffered similar raids at the hands of the Persians in 525 and 343 B.C. In the Ptolemaic period Thebes became identified with nationalist interests against Greeks, and mounted three rebellions against the Alexandrian Ptolemies. With

the suppression of the last of these in 80 B.C., the temple of Amun was largely abandoned, Karnak lost its preeminence, and the center of occupation shifted S to Luxor where in Roman times stood the agora of the city and the military camp. With the advent of Christianity many of the temples were transformed into churches and monasteries.

DONALD B. REDFORD

THEBEZ (PLACE) [Heb *tēbēṣ* (תֵּבֵץ)]. A settlement which Abimelech had captured but was never able to leave, having been mortally wounded by a millstone a woman dropped on his head from a tower (Judg 9:50; 2 Sam 11:21). The site is to be identified with Tubas (M.R. 185192), in a fertile region some 13 miles NE of Shechem. The settlement would have been strategically important to Abimelech inasmuch as it stood at a point of easy access to both Shechem and Dothan.

ELMER H. DYCK

THEFT. See PUNISHMENTS AND CRIMES (OT AND ANE).

THEKLA, ACTS OF. According to ancient Christian tradition, Thekla of Iconium was a convert, companion, and colleague of the apostle Paul. After she proved herself faithful by enduring persecutions, Paul ordained her to teach. At about the year 200 C.E. Tertullian (*De Bapt.* 1.17) wrote:

> But if they claim writings which are wrongly inscribed with Paul's name—I mean the example of Thecla—in support of women's freedom to teach and baptize, let them know that a presbyter in Asia, who put together that book, heaping up a narrative as it were from his own materials under Paul's name, when after conviction he confessed that he had done it from love of Paul, resigned his position.

The book referred to here almost certainly was the *Acts of Paul,* in which we find the following stories of this Thekla.

When Paul and his two traveling companions, Demas and Hermogenes, arrive in Iconium to preach their gospel and the necessity of sexual continence, a beautiful young woman named Thekla converts and then refuses to marry Thamyris, to whom she had been betrothed. He and Theocleia, her mother, unsuccessfully beg her to abandon this newcomer Paul. Thamyris, however, succeeds in bribing Demas and Hermogenes to desert Paul and they tell him how to bring charges against the apostle before Roman authorities. Thekla visits Paul in jail and she is brought with him to trial. Paul is flogged and released, but Thekla, at her mother's insistence, is condemned to the pyre. A miraculous shower extinguishes the flames and Thekla leaves Iconium in search of Paul.

She finds Paul and Onesiphorus' family in a cave praying for her welfare, narrates her rescue, and asks Paul to baptize her. He refuses until she is more fully proven. She and Paul then enter Antioch of Pisidia, where an officer of the emperor cult attempts to have his way with her. In defending herself she violates the imperial symbols Alexander wears and thus is accused of the capital offense of sacrilege. A Roman judge condemns her to the beasts. The first beast released is a lioness, which refuses to eat her. Next comes a bear but the lioness kills it. Then a lion fights the lioness and both die. Inasmuch as Paul had refused to baptize her, she baptizes herself safely in a pool of ferocious (?) seals. Other beasts are

released, but the women inebriate them by throwing flowers, spices, and perfumes into the arena. In desperation the executioners finally tie her to two bulls and thrust hot pokers onto their genitals. The bulls bolt but fire burns the ropes and Thekla is spared. Queen Tryphaena, her patroness in Antioch, gives her money to care for the poor and sends her off to find Paul. When the apostle hears Thekla's story he tells her "to teach the word of God." Tradition claimed that she established a ministry in Seleucia of Isauria where she taught, cared for the poor, and healed the sick (see, e.g., the later Greek additions to the end of the *Acts of Paul and Thekla*).

Tertullian thought the author of the *Acts of Paul* concocted Thekla out of an overly enthusiastic "love of Paul," but it is more likely the author had learned Theklan legends from local storytellers and wrote them up in his own *Acts.* Given the dominant place of women in the story and the use of Thekla's memory to authorize women teaching and baptizing, it is likely these storytellers were themselves celibate women. The author of the pseudo-Pauline Pastoral Epistles (1 and 2 Timothy and Titus) seems to have known such stories and to have dismissed them and their legitimations of women's ministries as "tales told by old women" (1 Tim 4:7; MacDonald 1983). It is difficult to know how the legends were generated, but it is quite possible that an Anatolian woman named Thekla was in fact active in the Pauline mission and later became the subject of fantastic legends used to support women in their ministries.

Be that as it may, Thekla was popular in the imaginations of early Christians. The sections of the *Acts of Paul* pertaining to her circulated independently as the *Acts of Paul and Thekla* and were widely read and copied. We know of several traditions about her death, and she was the heroine of Methodius' *Symposium* (early 4th century). Her iconography is rich until the 12th century. Thekla typically is depicted listening to Paul preach, half naked between two wild beasts, or as an orant surrounded by flames. Vowed virgins often took her name, including Macrina, the sister of Basil the Great and Gregory of Nyssa. Her feast day was celebrated in the East on September 24 and in the West (until she was stripped of canonical status at the Second Vatican Council) on September 23.

The zenith of her popularity came in the 4th to 6th centuries and was largely concentrated in Seleucia, Isauria, the traditional location of her ministry. Gregory of Nazianzus called Seleucia "the city of the holy and illustrious virgin Thekla" (*On the Great Athanasius* 22), and here archaeologists found a richly decorated, huge basilica—almost the length of a football field—as well as other shrines, all in honor of St. Thekla. A 4th-century nun named Egeria visited Seleucia and recorded in her extant diary that it contained "a tremendous number of [monastic] cells for men and women (*The Travels of Egeria* 23, 1–6). A 5th-century resident of Seleucia wrote a two-volume work entitled *The Life and Miracles of Saint Thekla,* the first half of which simply paraphrases the *Acts of Paul and Thekla.* The second half, however, contains 46 stories of miracles attributed to Thekla by the local faithful, thus providing a window through which to see entire provinces of Asia Minor devoted to the veneration of this virgin martyr.

The text of the *Acts of Paul and Thekla* appears in pp. 235–72 of *Acta apostolorum apocrypha,* vol. 1, eds. R. A. Lipsius and M. Bonnet (Leipzig 1891–1903; reprint Darmstadt 1959). See also *NTApocr* 2: 353–64 and *DACL* 15: 2225–36.

DENNIS R. MACDONALD

THEODICY. Life's harsh enigmas render belief in a benevolent deity difficult. Theodicy is the attempt to defend divine justice in the face of aberrant phenomena that appear to indicate the deity's

indifference or hostility toward virtuous people. Ancient Israel's conviction that God shaped historical events to benefit a covenant nation exacerbated the issue, particularly in the wake of events associated with 722 and 587 B.C.E. In one sense the pitiful state of Yahweh's worshipers during the Exile and in postexilic Judah transformed theodicy into a question about history. For this reason, theodicy was never just a theoretical problem of the individual; divine justice involved society itself—the distribution of goods, access to knowledge and power, the formation of legal statutes. Moreover, distinct theodicies surfaced to protect the interests of the privileged and the powerless.

A. Theodicy in the Ancient Near East

Although more severe in Israel because of its belief in Yahweh's sole authority, the problem of theodicy also beset Egyptian and Mesopotamian thinkers. Most Egyptian authors resolved the issue by placing the blame on human shoulders, for example, "The Protests of the Eloquent Peasant" (*ANET*, 407–10), "Suicide" (*ANET*, 405–7), and "The Instruction of Amenemhet" (*ANET*, 418–19). On the other hand, "The Admonitions of Ipuwer" (ca. 2100 B.C.E.) contains a gloss that boldly asks if the gods are sleeping while social chaos rages, adding that they set confusion throughout the land as if loving death (*ANET*, 441–44). Mesopotamian texts spread the blame more freely. A Sumerian Job text, "Man and His God" (*ANET*, 589–91), attributes the following response to sages of old: "Never has a sinless child been born to its mother …" Rather than accusing humans of innate guilt, "I Will Praise the Lord of Wisdom" (*ANET*, 434–37) appeals to human ignorance about the gods, whose will cannot be discerned and may in fact be just the opposite of what people think the deities desire. "The Dialogue of Pessimism" (*ANET*, 600–1) implies that societal chaos renders life meaningless, which is an indirect accusation of the gods. The sharpest attack comes in "The Babylonian Theodicy" (*ANET*, 601–4), an acrostic poem of twenty-seven stanzas of eleven lines each. Here the sufferer tells a pious friend that the gods endowed the human race with lies, and the friend defends the gods by appealing to broader experience and divine potential for making things right in a moment.

B. Theodicy in Ancient Israel

The Israelite responses to the problem of theodicy resemble these in some ways but bear their own stamp, chiefly because of Israel's experience. Creation faith in the goodness of all things precluded some answers, while belief in Yahweh's self-revelation ruled out others. Above all, an unfailing insistence on Yahweh as a moral creator and champion of the oppressed narrowed the possibilities for accusing God. Nevertheless, the dogmatic crust created by these fundamental presuppositions cracked and burst under the pressure of a greater integrity, a willingness to expostulate with the deity. Without exception, dissent arose on the basis of a profound vision of a better society in which Israel's God would play a decisive role.

The scope of this wrestling with theodicy is astonishing, from Eve's defense of the creator whom the serpent accused of tyranny to the Chronicler's effort to apply the Deuteronomistic historian's national punishment to specific individuals such as King Manasseh (cf. the Prayer of Manasseh in the Apocrypha). Spurred on by Josiah's shocking fate, the Deuteronomistic historian issued a monumental theodicy, an explanation for Judah's defeat that made sense theologically, at least to some. In a word, the nation sinned, God punished it by external foes; the people repented, God restored them. The cycle repeated itself ad infinitum. Gideon's sharp retort to an angel's assurance of divine solicitude speaks volumes: "Pray, sir, if the Lord is with us, why then has all this befallen us?" (Judg 6:13). Abraham's articulation of the issue can hardly be improved on: "Shall not the Judge of the whole earth do right?" (Gen 18:25); although Moses' request that Yahweh blot him out of the divine record book shows how seriously the author of Exod 32:32 took wholesale slaughter of populations by an angry deity. Joshua's request that a condemned Achan glorify God, assuming complete responsibility for his death, shows that the author valued divine justice greatly (Josh 7:19).

The prophets struggled valiantly with this problem, despite their strong sense of national waywardness. For Habakkuk, the prosperity of the wicked and the sorry lot of the virtuous seemed to suggest divine blindness and inactivity, until he caught a vision of broader horizons on which history began to unfold. He asked the most difficult questions of all: How long, and why? His contemporary Jeremiah personally bore

the brunt of divine abuse, which he chose to describe as seduction and rape. Still, the prophet conceded that Yahweh was by definition *ṣaddîq* (innocent), even though Jeremiah felt constrained to press charges (Jer 12:1). Ezekiel, another contemporary, in Babylonian exile, argued with some people bent on challenging Yahweh's justice, and the best he could do was assert the opposite opinion (Ezekiel 18). The prophetic novella about Jonah states that at first the prophet refused to carry out the divine command precisely because of God's compassionate nature, wondrously announced in Exod 34:6–7. The issue separating Jonah and his Lord concerned divine justice: can a wicked city like Nineveh escape punishment by repenting? Jonah believed justice demanded punishment, whereas Yahweh thought a higher principle of mercy was operative. This argument placed the issue of divine justice on a different level from that presupposed by the authors of Genesis 18 and Exodus 32. Deutero-Isaiah pressed in another direction: an innocent servant died on behalf of other people, and God is essentially hidden (or hiding).

Wisdom Literature took up the problem of theodicy in earnest. The book of Job offered several partial answers—human ignorance, divine mystery, corrective discipline, delayed punishment and rewards—but acknowledged the problem as an insolvable enigma before which the best response was silence in the presence of a self-revealing creator. Various paradoxical proverbs recognized manifestations of anomie in society, for innocent victims like Abel forced such concessions, particularly after the weakening of corporate solidarity in favor of an increasing emphasis on the individual. Under Hellenistic influence, Ben Sira lifted the arguments out of the realm of verification, insisting on metaphysical and psychological answers, specifically that nature rewards virtue and punishes vice, and that evil people suffer psychic stress. Wisdom of Solomon endorsed both answers, emphasizing the latter with specific reference to the Egyptians who held Israel in bondage. The martyrdom of the devout during the Maccabean revolt prompted the author of Daniel 12:2 to entertain the possibility of life after death, but 2 Esdras laid bare the inadequacy of this solution, now extended in duration. Eternal torment for the masses hardly salvaged God's honor even if a few fortunate people like Ezra enjoyed hope of a better fate. The notion of human depravity threw a question over the worthwhileness of creation, a version of the modern debate over whether or not a moral creator should have fashioned free beings who would choose evil. A few psalms aired the problem of theodicy and responded to it by denial (Psalm 37), appeal to mystery (Psalm 49), and liturgy (Psalm 73, awareness of the deity's presence in the sanctuary, with assurance that the goodness of God alone mattered). Within rabbinic literature, the concept of *yēṣēr hārāʿ* and *yēṣēr haṭṭōb,* evil and good dispositions, offered a convenient explanation for human conduct, for the rabbis believed that God would eradicate the evil inclination in due time. An extreme view characterized the thinking in Ecclesiastes; the deity was remote and indifferent to morality, giving free rein to chance and conceding ultimate authority to death.

In the Hebrew Bible the fundamental issues relating to theodicy cover three types of evil: primary, moral, and religious. The first type refers to catastrophic phenomena in nature such as earthquakes, tornadoes, pestilence, drought, and the like. The Yahwistic narrative examines this issue, refusing to absolve the deity of responsibility for evil's existence as manifested in the talking serpent, although largely exonerating Yahweh for sending the Flood (contrast the Mesopotamian parallels). Moral evil, arising in human decisions, exercises the energies of numerous thinkers, both in its social and its individual dimensions. Religious evil, which restricts itself to the vertical plane and thus involves only the individual and God, surfaced late but achieved poignancy in the poetic disquisitions of 2 Esdras. Because the created order was essentially good, the dualistic answer failed to gain momentum, despite the partially opened door accompanying the notion of Satan. Older claims that Yahweh created weal and woe, light and darkness, (Isa 45:7; Amos 3:7) retained their power to command assent. That belief introduced some embarrassing ideas, e.g., the divine seduction of persons to their harm (the pharaoh of the Exodus; 1 Kings 22) and pushed individual prophets into curious statements (Ezekiel's insistence that Yahweh commanded human sacrifice in order to horrify people). Small wonder a popular questioning of divine justice did battle with Yahweh's defenders, also beset with official complaints against divine governance.

Answers to the problem of evil derived from several contexts. Belief in a harmonious universe issued in a corresponding conviction that a rational principle, Order—or Yahweh—rewarded good deeds and punished evil acts. This principle, planted in nature at creation, was identified with divine wisdom (*maat* in Egypt), making endemoniasm an ethical issue, for virtuous deeds sustained the universe while at the same time bestowing life's good things on deserving persons. A theory of reward and retribution permeated the ancient world, hardening into dogma and eliciting sharp dissent throughout the ANE. Israelite prophets naturally subscribed to this theory, but they stretched it to the limit by insisting that some persons suffered precisely because they were Yahweh's servants and that others suffered because they participated in the divine pathos (Hosea).

The family setting produced a different response to the problem of evil. Loving parents disciplined their children to shape character and to protect them from harm. The parental metaphor for God lent credibility to the idea that the heavenly Parent chastened disobedient children. In fact, this metaphor enabled teachers to insist that discipline was proof of love. The educational setting, at first the home and later the royal court and schoolhouse, also encouraged this understanding of discipline, which was frequently harsh, as Sumerian and Egyptian school texts attest.

All religion presents a vexing problem—how to determine the purity of worship. The human tendency to assume the central position and the eagerness to act in a manner that pays worthy dividends forced Israel to ask whether anyone served God for nothing. The very survival of faith depended on a positive answer to this question, but the only way to find out whether persons would remain faithful without thought of the carrot or the stick was to submit them to a test. The probative response to the problem of evil thus emerged from the noblest of intentions. Perhaps that fact partially explains the dominance in later memory of the Joban response to suffering that characterizes the prose prologue, almost to the exclusion of the poetry's defiant insistence on appropriate rewards, an idea that also invaded the epilogue. Experience taught individuals in the ancient world that most unpleasant things passed eventually. Hope springs eternal in the human breast, and patience was deemed essential to learned persons. The God who draws near, inspired worship far and near, for many people believed that suffering and tears were superseded by joy. The idea of "latter things," eschatology, grew naturally from covenant promises never fully actualized. Davidic kings absolutized this ideology to enhance their own status and to legitimize the cult at Jerusalem and Zion's inviolability. People longed for the Day of the Lord when the mighty deliverer would correct all wrongs. Apocalyptic thinkers pushed that eschatological deliverance beyond this world into the remote aeons of eternity. Only thus would forgotten victims like Job's children and servants ever experience vindication.

From the realm of the sacrificial cult arose yet another answer to the problem of evil. The presumed efficacy of human sacrifice and, still later, animal or cereal offerings suggested that redemption occurred for those who incurred guilt, thus revealing God as forgiving. This notion was extended to include symbolic gestures of devotion such as prayers and the libations of one's mouth, and even further to embrace vicarious sacrifices. That powerful concept erupted for the first time in the Servant Poems of Deutero-Isaiah, and Christianity understood Jesus' death in this way.

In some circles evil was denied any reality. Prosperity of the wicked was dismissed as illusive, despite appearances to the contrary. According to the author of Psalm 73, the affluence of evil people had no more substance than images in a dream. On waking, Yahweh would shake these images into oblivion. In addition, Israel's thinkers recognized mitigating circumstances, so that passing judgment on a given individual became hazardous.

For some people evil offered an opportunity to act heroically. In short, suffering prepared individuals for knowledge of the inner self or for a revelation of divine will. Human extremity became God's occasion to act (cf. John 9:3), and suffering enabled growth in character and maturity in personality. In Job's case suffering led to immediate sight, a vision of the Lord of Nature that convinced the miserable creature that all previous knowledge of God had been derivative and hence flawed. The devout worshiper in Psalm 73 whose faith was sorely tested later felt God's hand on warm flesh and emerged from darkness into light with a mighty shout: "If I have you, I want nothing else."

One of the oldest answers to the problem of life's ambiguities emphasized ultimate mystery and human limits. The universe had its flaws, and no one possessed sufficient intellience to explain its enigmas. The earliest proverbs in the OT already perceived many areas in which human knowledge came up against a mightier force—Yahweh's will. In the last resort, the poet responsible for the book of Job refused to offer a final answer to the mystery of suffering, even though Yahweh certainly had the opportunity to resolve the problem before which a groping humanity stands. In this instance silence was undoubtedly the right option for the poet, for keeping the question open was preferable to closure by means of a simplistic answer. Perhaps the enigma of suffering points to the mystery of the biblical God, who gathers human pain into the divine heart. Evil caused suffering on God's part, for that was the price of human freedom.

Qoheleth's skeptical response abandoned all hope of divine justice, in this radical view echoing Job's strident accusations of a deity who remained oblivious to human misery and Agur's mocking parody of sacred tradition (Prov 30:1–4). Qoheleth's flippant question, "Who knows?" grew out of dismay that the universe had gone awry, rendering existence futile and absurd. One could even speak of a tendency in the Hebrew Bible toward antitheodicy. The insistence on divine freedom and human limits persisted in spite of quests for rational solutions to the problem of evil. Israel's sages recognized pride's folly, the arrogant insistence on judging God on the basis of human reason. This intuition led the author of Job to propose an answer within revelation rather than reason, just as the composers of "The Babylonian Theodicy" and "I Will Praise the Lord of Wisdom" appealed to religious tradition and mystery rather than locating the final word in human logic.

In ancient Israel history kept the problem of theodicy alive, for few people doubted that Yahweh stood behind the events of 722 and 587 B.C.E. The ensuing crisis of faith resulted in a transcending of the ethical principle—strict justice giving way to compassion—and a universalization of providence. The basis for both moves lay in Israel's idea of creation, for only the fashioner of the universe had sufficient knowledge and power to render absolute justice, or to forgo it. Confronted by this maker, the questioning individual had one of two options: repentance or despair.

Within Wisdom Literature, texts dealing with creation frequently broach the issue of divine justice. The emergence of the figure Wisdom (*ḥokmāh*) softened the anxiety resulting from emphasis on the High God who ruled the whole universe, rather than promoting allegiance to the patron deity of a single group. Wisdom, personified as a woman, turned toward human beings like a lover, assuring them of divine benevolence. The sages also employed a debate formula in several discussions of theodicy. The form advised people against saying something ("Do not say"), cited the specific expression that the teacher wanted to prevent, and offered the reason for urging silence in this regard. Wisdom and apocalyptic had an advantage over prophecy and Yahwism generally—they lacked historical triumphalism. Whereas the sages virtually ignored the Israel's history until Ben Sira, apocalyptic surrendered the belief that Yahweh controlled historical events, for history had become a nightmare.

Modern calamities such as the Lisbon earthquake and, above all, the Holocaust have raised the question of theodicy to new heights. Traditional free-will defenses have lost their power, partly because they are ahistorical, overly abstract, and rationalistic. Cosmic order no longer makes sense, philosophical theism reduces religion to a few ideas that are shared by many groups, and the experience of faithful believers who struggle against evil escapes notice. In the opinion of some, process thought offers a way of approaching the problem that resembles the OT emphasis on God's susceptibility to change. Perhaps patient resistance to evil that juxtaposes love and hatred, passive response and harsh force, comes closest to discerning a viable response to evil. The crucial issue remains: will such action actually overcome evil? Only when resistance to God has vanished will theodicy cease to trouble theists.

JAMES L. CRENSHAW

THEODOTION, THEODOTION'S VERSION. Among the early Jewish translators of biblical material into Greek was Theodotion of Ephesus, who was active in the mid-2d century C.E. Origen, who organized his Hexapla a century later, included work attributed to Theodotion in his sixth column. In certain books, such as Exodus, Joshua, and Job, this sixth-column material may securely be identified with the Theodotionic recension. In such books, and especially in Job, Origen regularly drew on Theodotion to "correct" the then current Greek to reflect more accurately the Hebrew text Origen held in highest esteem. In other places, however, the sixth column does not contain Theodotion (as with the Minor Prophets and Psalms, for example), and scholars must seek his version elsewhere. The trail sometimes leads to the LXX itself, as in the case of Daniel, where Theodotion's edition supplanted the Old Greek at a very early date.

In fact, quotations from Theodotion's Daniel and from other material identified with him antedate "historical" Theodotion by as much as a century. This has led to the hypothesis of an "Ur-Theodotion." His work may be described as a thoughtful revision of the Old Greek of some (all?) of the OT toward a Hebrew that closely resembled the text preserved by the Masoretes (the MT). This anonymous individual (or group of individuals) apparently lived in the 1st century B.C.E. and provided the basis for "Theodotionic" quotations prior to Theodotion. It is unclear how extensive are the further developments that can be attributed to the 2d-century Theodotion, whose existence and activity are too widely witnessed by tradition to be dismissed altogether.

Efforts to establish the locale and purposes of Ur-Theodotion have been revitalized by the work of Dominique Barthélemy (1963). For him, (Ur-)Theodotion cannot be understood apart from the *kaige* recension of the LXX, which Barthélemy first identified on the basis of a Minor Prophets scroll found in the Judean desert. Barthélemy isolated a number of characteristic translation devices and equivalences for this recension, among which was the representation of Hebrew *gm*, "also," by the Greek *kaige*. There is no doubt that in certain biblical books, like Exodus and Joshua, the text preserved in Theodotion's name is in fact part of this larger recension. Each book or block of material, however, must be investigated separately. In Barthélemy's opinion, *kaige*—and, therefore, Theodotion—originated in Palestine in circles that can be closely linked to particular types of rabbinic exegesis. Barthélemy seeks to establish the identity of Ur-Theodotion: he is Jonathan ben Uzziel, to whom a Targum on the Prophets is generally credited. Barthélemy's overall characterization of the *kaige* recension has won wide acceptance, as has his association of much of Theodotion's version with the recension. His more speculative attempts at identification and localization have met with a more guarded response.

Judged on its own merits and as part of the *kaige* recension, Theodotion's version is generally accorded high marks. He aimed to produce a text that retained much of the flavor of the Semitic original and at the same time appealed to a wide audience of Greek speakers, and in this he succeeded. One of his goals,

apparently, was to provide standard representations of key Hebrew words and phrases where the Old Greek he was revising preferred variety. He was also partial to transliteration of technical terms or of other unclear or obscure words. Many of the techniques used by Ur-Theodotion (and the *kaige* recension in general) were perfected by Aquila, and it is for that reason that Barthélemy speaks of Theodotion-*kaige* as Aquila's precursor. See also AQUILA'S VERSION. However, it would be unfortunate to think of Theodotion's work only in terms of its heirs or even of its subdivisions. As a finished product, it represents a high point in Jewish attempts to make the sacred text comprehensible to those who no longer understood the Hebrew language.

THEODOTUS (PERSON). Theodotus was a common Greek name meaning "gift of God," and was the name of several significant people in secular and sacred history.

1. A Samaritan epic poet who wrote in the 2d century B.C.E., of which only fragments are extant (see *FGrHist* 732; and Eusebius *Praep. Evang.* 9.22).

2. Among the 72 Palestinian elders listed in the Jewish-Alexandrian *Letter of Aristeas* is the Greek name Theodotus.

3. One of the ambassadors along with a certain Mattathias (unless these are the Greek and Hebrew name of the same man) sent by the Syrian general Nicanor to make peace with Judas Maccabeus (2 Macc 14:19).

4. An Aetolian whose plot to murder Ptolemy IV Philopator, king of Egypt (221–204 B.C.E.), was foiled by a renegade Jew (*3 Macc.* 1:2; and compare further Polybius 5.81).

5. Theodotus, son of Vettenus. An inscription bearing his name found on Mt. Ophel, Jerusalem, indicates that he dedicated a synagogue (*CII* 2 [1952], no. 1404). The excavations conducted by Weill disclosed the remains of a large building dating from Roman times, including the installations of a bathhouse. The Greek inscription indicates what the complex of buildings was used for: "Theodotus the son of Vettenus, priest and *archisynagogos,* son of the *archisynagogos,* grandson of the *archisynagogos,* built this synagogue for the reading of the Torah and the study of the commandments, and the hostel and the rooms and the water installations, for needy travelers from foreign lands. The foundations of the synagogue were laid by his fathers and the elders and Simonides." No certain evidence identifies this synagogue with any mentioned in literary sources such as the synagogue of the Freedman, as some scholars suggest (Acts 6:9). The name may indicate Roman connections, perhaps a family of Jewish exile origin which built the synagogue after gaining freedom to cater to the needs of pilgrims arriving in Jerusalem.

SCOTT T. CARROLL

THEOLOGY. This entry consists of two articles. The first focuses on OT theology and the second focuses on NT theology. For a survey of attempts to understand theologically the relationship between the two, see THEOLOGY (BIBLICAL), HISTORY OF.

OLD TESTAMENT

OT theology may be defined as the exposition of the theological content of the OT writings. While such a definition is simple and to the point, it masks a variety of understandings which have been operative in the history of the discipline, as well as the complex range of problems associated with it, which require further elucidation.

2. Emancipation from Dogmatics
3. The Influence of Rationalism
4. OT Theology Eclipsed by the History of Israelite Religion
5. Rebirth of OT Theology
6. The "Biblical Theology Movement" and the Alleged "Crisis" in OT Theology
7. Summary: Two Fundamental Dialectics

B. Current Issues and Problems
1. Descriptive and Normative Dimensions
2. Methodology
3. Revelation through History, Tradition, and Story
4. Is OT Theology an Exclusively Christian Enterprise?

C. Conclusion

———

A. History of OT Theology

OT theology came into existence as a distinct discipline toward the end of the 18th century. Prior to that time, it was subsumed, along with NT theology, under the larger discipline of biblical theology. It should be noted, however, that within the context of the Jewish canon, OT theology is synonymous with biblical theology, whereas in the context of the Christian canon, it is a subdiscipline of the latter. See also THEOLOGY (BIBLICAL), HISTORY OF. An understanding of the origins of biblical theology is essential for a proper understanding of fundamental issues in OT theology today. Consequently we shall begin our historical survey prior to the time when OT theology became a distinct discipline. At the risk of a certain amount of oversimplification, the history of the discipline may be divided into five distinct periods.

1. In the Service of Protestant Orthodoxy (ca. 1550–1650). While the Bible has been read theologically since its formation, biblical theology as a discipline has its roots in the Protestant Reformation. The Reformers' emphasis on Scripture as the sole source and norm for all matters of faith provided the soil from which biblical theology sprang. While the term itself was not used by the Reformers to designate a distinct discipline, it is clear that for them biblical theology meant a systematic theology which was biblical in character, that is, for which the Bible was the primary, if not the sole, source and norm. Insofar as the Reformers self-consciously sought to differentiate their theology from Roman Catholic dogma, in which tradition played a major role, one may note a polemic dimension in the birth of biblical theology. One could go on to observe that while the target of the polemic changed periodically, the polemic dimension has been a constant feature of biblical theology throughout its history, in the sense that it had to fight repeatedly for an unbiased hearing of the theological witness of Scripture.

While the Reformers in their use of Scripture introduced a creative tension between the Bible and dogmatic theology, the opposite was true of the proponents of Protestant orthodoxy who followed them. In their hands the Bible became subservient to Protestant dogmatics, which determined the selection, order, and treatment of biblical passages. The Bible came to be viewed as a uniform sourcebook of quotations whose primary task was to support the dogmas of Protestant orthodoxy against the dogmas of Roman Catholicism. No distinctions were made in regard to time, authorship, historical context, compositional purpose, or distinctive theological perspectives of the biblical documents. The system of arranging biblical data was the traditional *loci* method known from medieval scholasticism. That is, various Scripture texts would be listed and briefly commented upon under the topical rubrics drawn from dogmatic theology. The understanding of biblical theology reflected in Protestant orthodoxy may be characterized as "dogmatic biblicism" or proof-texting *(dicta probantia).* Early in the 17th century, the actual words "biblical theology" began to appear in the title of works of this kind. As far as we know, the first work to use such a title was W. J. Christmann's *Teutsche Biblische Theologie* published in 1629. While many other works of this nature were published subsequently, a significant shift in the

understanding of biblical theology began to take place during the second half of the 17th century, thus ushering in a new era in the history of the discipline.

2. Emancipation from Dogmatics (ca. 1650–1800). The more attentively Scripture was read and studied during the course of the 17th century, the more it became apparent that the biblical documents did not really contain a theological system of doctrines at all. Rather, Scripture was cast into the form of a historical narrative. It told the story of God's unfolding relationship with humanity through a sequence of temporal events *(oeconomia temporum).* Furthermore, it was noted that this relationship between God and humanity was given form through a series of covenants. Hence this approach to Scripture came to be known also as "federal" or "covenant" theology (from Lat *foedus*, "league, covenant"). One of the first and most influential proponents of this new approach was Johannes Cocceius (1603–69), who was trained in OT and oriental studies, but toward the end of his life became professor of dogmatic theology at the University of Leiden. Cocceius abandoned the topical outline of the traditional dogmatics in favor of covenant as the central concept around which the theological assertions of Scripture were organized. At the same time he emphasized the notion of Scripture being the record of God's redemptive activity in history, thus becoming a forerunner of the later *heilsgeschichtliche* approach to biblical theology.

The shift from a dogmatic to a more historically oriented approach to biblical theology accelerated during the course of the 18th century. Of particular importance in this development were two cultural movements of the 18th century: German Pietism and the Enlightenment. Pietism was a revolt within the German Church against Protestant scholasticism, which it considered to be excessively preoccupied with dogmatic speculations and arid abstractions. Whereas Protestant orthodoxy tended to equate the Christian faith with intellectual assent to sound doctrine, Pietism stressed personal experience and awareness of the presence of God, as nourished through a life of prayer, personal devotion, Bible reading, and moral living. Pietism's emphasis on the reading and study of Scripture by all brought about a greater familiarity with the contents of the Bible. It also brought about an increasing awareness of the differences between biblical and dogmatic theology. Biblical theology, which until now had been subservient to Protestant dogmatics, became increasingly differentiated from and even opposed to the latter during the course of the 18th century. In distinction from dogmatic theology, biblical theology was primarily concerned with the temporal and sequential unfolding of revelation in the Bible. The religious teaching of the Bible must be set forth in its own right and according to its own categories, rather than in the straitjacket of dogmatic systems. It was to be practical as well as edifying for the ordinary believer. The meaning of Scripture was to be ascertained with careful attention to the historical context out of which it arose and to the specific nuances of biblical words and concepts.

The increasing differentiation of biblical theology from dogmatic theology was also greatly aided by the Enlightenment which swept across Europe during the 18th century. Rationalism's aversion to dogmatic religion, its belief in the powers of the human intellect to ascertain truth through observation and inductive reasoning, as well as its belief in the existence of universal natural religion which was in conformity with the demands of reason, exerted a powerful influence on biblical studies and widened the gulf between biblical and dogmatic theology. Increasingly the Bible came to be subjected to the same kind of critical and rational study as any other human document of antiquity.

Thus under the impact of both Pietism and rationalism, biblical theology was liberated from the dominance of dogmatic theology and became a distinct and independent discipline. The first major biblical theology to be written from this new vantage point was G. T. Zachariä's four-volume *Biblische Theologie oder Untersuchung des biblischen Grundes der vornehmsten theologischen Lehren* (1771–75). Mindful of the widening gulf which had been shown to exist between the meaning of biblical texts as determined by critical exegesis and that alleged by dogmatic theology, Zachariä set out to determine the theological teaching of the Bible free from the constraints of any dogmatic system. The latter was, rather, to be tested and, if necessary, to be corrected by the former. Whereas dogmatic theology had treated the Bible like a uniform textbook of theological doctrines, a true biblical theology must allow for greater historical differentiation and individual treatment of the biblical writings. Each book of the Bible has its own peculiar character and intent. Differences in time, place, circumstance, and purpose must not be

glossed over, but must be determined as accurately as possible. Philological and semantic concerns were to be given due emphasis, so as to penetrate the peculiar language and thought of the Bible. While Zachariä thus clearly emphasized the historical and descriptive character of biblical theology, he believed that it had also a constructive or normative function. Some of the assertions and beliefs of the biblical authors related more to their own times than to ours; consequently, biblical theology must differentiate between that which belonged to their own time and that which is valid or binding for all time. That which was historically or culturally conditioned must be distinguished from that which is abiding or universal. Biblical theology must not only expound the exegetical meaning of the Bible, but must also attempt to translate the timeless biblical truths into contemporary garb, so as to allow us to appropriate them. The results of such a biblical theology could then serve as the basis for a purified dogmatic or systematic theology.

The emancipation of biblical theology from dogmatic theology found its clearest expression toward the end of the 18th century in a programmatic essay by J. P. Gabler (1753–1826). Gabler has often been credited as being the founder of biblical theology as a distinct theological discipline. That, however, is not quite accurate, for many of the ideas he formulated had already found expression in other 18th-century biblical theologians prior to him, such as Zachariä, W. F. Hufnagel, and J. G. Hofmann. It would be more accurate to say that he took up ideas and impulses present in the work of other 18th-century biblical theologians and formulated them into a coherent programmatic statement which became formative for the entire subsequent history of the discipline. Gabler himself never attempted to write a biblical theology, but his program for one was laid out in his inaugural lecture at the University of Altdorf in 1787, as well as in subsequent occasional articles. The rather lengthy title of his inaugural lecture was indicative of his program: "Concerning the Proper Distinction between Biblical and Dogmatic Theology and the Appropriate Definition of the Respective Goals of Both." Gabler proceeded to differentiate the two theological disciplines as follows. Biblical theology is historical in character; that is, it sets forth what the sacred writers thought about divine matters. Dogmatic theology, on the other hand, is didactic in character, teaching what a given theologian thinks about divine matters in accordance with his ability, his particular circumstances, age, locale, religious and intellectual tradition, and similar conditioning factors. Gabler went on to differentiate two phases or distinct tasks of biblical theology. The first task of biblical theology was to ascertain simply what the various biblical authors thought and asserted about divine matters in their various contexts. This was to be accomplished by means of a purely grammatical and historical exegesis. All allegorizing or spiritualizing was to be shunned. Care was to be exercised in differentiating the various ideas of biblical writers, not to blur differences but to arrange and compare these ideas in some suitable manner. The second task of biblical theology was to sift these various biblical concepts and assertions in terms of their universal and abiding value and to deduce some general concepts and ideas from these which could serve as a basis for the construction of a dogmatic theology. In subsequent writings, Gabler referred to these two stages in biblical theology as *wahre* ("true") and *reine* ("pure") biblical theology respectively (Hayes and Prussner 1985: 62–64). It is clear from this distinction that for Gabler, biblical theology thus entailed both a purely historical or descriptive and a constructive or normative dimension; and this distinction has continued to occupy biblical and OT theology down to the present day. It is also obvious that the second task involves the application of certain value judgments to the Bible which are extrinsic to it. Usually these were drawn from Christian theology or contemporary philosophy. For Gabler, for instance, one such norm was the concept of the spiritual evolution of the human race, according to which spirit evolves in stages from the lower to the higher. The rationalism of the age of Hume is clearly reflected in his thinking on this point. In the century following Gabler, rationalism became a dominant influence in biblical theology.

3. The Influence of Rationalism (ca. 1750–1875). Initially rationalism, along with Pietism, had been a constructive force in emancipating biblical theology from the stranglehold of dogmatic theology and in establishing it as a distinct theological discipline in its own right. Many 18th-century biblical theologians combined both currents in their life and their scholarship. That is, they were both devout believers as well as rationalists, and this was reflected in their scholarly work on the Bible. But toward the latter part of the

18th and especially during the first half of the 19th century, these two currents more often than not stood in opposition to each other, as rationalism became the more powerful of the two. Increasingly, rationalist philosophy penetrated biblical theology and for a time forced it into a philosophical straitjacket which threatened to become as rigid as the older religious dogmatism had been. The Bible was now understood in terms of an evolutionary religious process leading from lower forms of religion to the absolute or universal religion. The latter was usually defined as a religion of reason (deism) or morality (Kant). Representative of this kind of 19th-century biblical theology were the works of G. L. Bauer, C. F. von Ammon, and G. P. C. Kaiser. Only those teachings of Scripture which were in accord with reason, or the universal religion as established by reason, were of abiding value. Everything else was to be discarded as the outgrown ideas and practices of a particular culture or period in history. Concomitant with such a rationalistic approach to biblical theology was an increasing devaluation of the OT as the record of an inferior stage in the religious development of the human race, and hence less suitable than the NT for the construction of a biblical theology.

Another important development during this period was the division of biblical theology into the separate disciplines of OT and NT theology, a practice which has become customary down to the present day. Several reasons may be cited for this development. One was undoubtedly the increasing recognition of the diversity of Scripture, especially the distinct differences in content, historical context, and outlook between the testaments, which made it more difficult to treat them as homogenous documents. Another reason was the sheer increase in data and new discoveries pertaining to the Bible, which made it more difficult for anyone to master the entire field of biblical studies. Thus specialization became a necessity. But thirdly, it must also be said that the rationalistic devaluation of the OT in favor of the NT undoubtedly contributed to this bifurcation in biblical theology. At any rate, the work that marked the beginning of this division of the discipline, and thus the beginning of OT theology proper, was G. L. Bauer's OT theology published in 1797. The subtitle of his work is indicative of Bauer's understanding of the newly independent discipline of OT theology: "Theology of the Old Testament, or Outline of the Religious Ideas of the Ancient Hebrews from Earliest Times until the Beginning of the Christian Era." That is, the task of OT theology was to trace the religious ideas of the Hebrews in their historical development and against the background of other ANE religions with whom the Hebrews came into contact. Already the influence of comparative religion was beginning to make itself felt here in this first OT theology. Bauer's rationalistic orientation manifested itself in the manner in which he judged the religious content of the OT. Miraculous and mythological elements in the Bible were dismissed by him as superstitions of a primitive race.

While other OT theologians were even more rationalistic than Bauer, not all biblical theologians of the late 18th and early 19th centuries were equally indiscriminate in their application of rationalistic philosophical principles to the Bible. Others, like D. von Cölln and W. L. DeWette, were more moderately rationalistic, seeking to bring into a creative confluence thought-forms of a modern age with the historical revelation and faith of the Bible. However, in response to the excesses of vulgar rationalism, a conservative reaction took place around the middle of the 18th century, leading to the writing of OT theologies along more orthodox lines. Representative of this development were scholars like E. W. Hengstenberg and F. Delitzsch. Other OT theologians of this period, like H. Ewald, G. F. Oehler, and E. Schultz, took a more moderate or mediating position somewhere between the rationalists and the orthodox Lutherans. Of these, the OT theology by Oehler, published posthumously in two volumes (1873–74) and written from a *heilsgeschichtliche* perspective, was a particularly influential work. It was also the first of the major German OT theologies to be translated into English shortly after its original publication.

4. OT Theology Eclipsed by the History of Israelite Religion (ca. 1875–1930). During the last quarter of the 19th century, another significant shift in emphasis occurred in the field of OT theology. The systematic-conceptual presentation of the theological content of the OT, whether of the rationalistic, conservative, or mediating variety, was replaced by a historical and genetic approach to the religion of Israel. Several factors brought about this development. First and foremost among these was the greater historical consciousness brought about during the 19th century by the work of such distinguished

historians as L. von Ranke. Of equal importance were developments in the comparative study of religions. Israel's religion was no longer viewed as an isolated phenomenon *sui generis,* but as one among several other ancient religions, such as those of Egypt, Babylon, Greece, or pre-Islamic Arabia. This development was hastened by a veritable flood of archaeological discoveries from antiquity, which shed fresh light on the Bible and the religious beliefs and practices contained therein. At the same time, revolutionary changes in the historical-critical understanding of the OT, associated with the names of Vatke, Graf, Kuenen, and above all Wellhausen, required new assessments in one's understanding of the history of the religious ideas of the OT.

These developments brought about a shift in the understanding and definition of OT theology. Even when scholars like B. Stade and E. Kautzsch continued to use the word "theology" in the titles of their works, it was apparent that they were really writing histories of the religion of the OT or of Israel. In recognition of this changed reality, most other scholars of this period abandoned the title "OT theology" altogether when they wrote on the religious content of the biblical documents. Reflective of this new outlook was a volume by R. Smend, *Lehrbuch der alttestamentlichen Religionsgeschichte* ("Textbook of the History of Old Testament Religion"). For the next four decades or so, few people wrote OT theologies; most wrote histories of OT or Israelite religion.

The history-of-religion approach differentiated itself from OT theology as traditionally conceived by the following characteristics: (1) an exclusive reliance on a historical-genetic, rather than a systematic-conceptual, approach to the OT; (2) a concomitant de-emphasis on the OT as special revelation, in favor of seeing it as a historical and human record of the evolution of Israelite religion; and (3) greater emphasis and attention to Israel's ANE environment. Increasingly, the OT was seen as an integral part of that environment and only one particular form of religious development among many.

Generally, the history of Israel's religion was traced through several distinct stages. Not infrequently, extrinsic value judgments were applied to these. Thus, for instance, postexilic Judaism was usually compared unfavorably with the religion of the preexilic prophets (Hayes and Prussner 1985: 140–41). Evolutionary philosophical principles were evident in many presentations of Israelite religion. The latter was usually described as evolving from primitive animism or nature religion to ethical monotheism. The influence of Hegel and Darwin may be discerned here. Thus, in spite of its claims to historical objectivity, the history-of-religions approach was not immune to the philosophical assumptions and cultural presuppositions of its own age.

5. Rebirth of OT Theology (1930 to the Present). The dominant hold which the history-of-religions approach had exercised over the discipline of OT theology began to wane during the period between the two world wars. Several factors helped bring this change about. Among them were the general change in theological climate following World War I, a reaction against the extremes of 19th-century historicism and evolutionary developmentalism, and new developments in the field of OT scholarship itself. Already during the twenties, there appeared a series of articles by leading OT scholars, such as R. Kittel, C. Steuernagel, O. Eissfeldt, and W. Eichrodt, calling for a revival of the discipline. Without surrendering the legitimate gains of the history-of-religions approach, many increasingly felt and expressed the need to allow the OT to speak theologically in its own right. In so doing, they hoped to defend the OT against its many detractors, as well as to enable it to speak more immediately and in fresh ways to contemporary theological issues and problems.

The year 1933 may be said to mark the beginning of a new era in OT theology with the appearance of two such works, one by E. Sellin and the other by W. Eichrodt. By far the most outstanding and enduring representative of the new era in OT theology is Eichrodt's *Theologie des Alten Testaments,* originally published in three parts between 1933–39 (Eng 1961–67). In spite of legitimate criticisms and acknowledged shortcomings (Hayes and Prussner 1985: 277), Eichrodt's work so far remains unsurpassed in comprehensiveness, methodological thoroughness, and theological acumen. From our vantage point in the late 20th century, one may safely say that it has stood the test of time and may well turn out to be the most significant work of its genre in the 20th century.

A brief look at its structure reveals the nature of OT theology as the author understood it. In an introductory chapter on methodology, Eichrodt defined the task of OT theology as constructing a complete picture of the realm of OT belief in its structural unity. Such an exposition was to be done with constant reference to two contextual realities: the world of ANE religion on the one hand, and the realm of NT belief on the other. It should be observed, however, that in actual execution, Eichrodt paid far more attention to the former than the latter. His methodology sought to differentiate itself self-consciously from the systematic rubrics of dogmatic theology on the one hand, and the genetic approach of a radical historicism on the other. The developmental analysis of the history-of-religions approach he replaced with a systematic synthesis of OT religion, but in rubrics and categories suggested by the OT itself. The biblical concept of "covenant" was chosen by him as an overarching category or unifying center of OT theology, and the material was presented in accordance with the following tripartite scheme: God and the People, God and the World, God and Man. A look at the full table of contents reveals that the organizational principle operative in Eichrodt's theology was systematic or conceptual. It should be noted, however, that within this systematic scheme, allowance was made for historically tracing changes in Israelite religion or in the perspective reflected in the chief documents and tradition complexes of the OT.

The systematic approach to OT theology, in terms of presenting a cross section of the basic structure of OT belief, continued to dominate the discipline for the next three decades. While there were differences in the choice of organizational schemas and overarching concepts, nearly all OT theologies were written from such a systematic-conceptual perspective. This methodological consensus was shaken during the late 1950s by G. von Rad with the publication of his immensely stimulating *Theologie des Alten Testaments* in two volumes (Eng 1961–65). Against the systematic-conceptual approach to the OT, von Rad insisted that the theological task proper to the OT is not the spiritual or religious world of Israel, nor the belief system of the OT, but simply Israel's own explicit assertions about Yahweh as reflected in the major tradition complexes of the OT. The latter, however, presented Yahweh's relationship to Israel as a continuing divine activity in history. Consequently, it was this picture of Yahweh's activity in the history of Israel as reflected in the traditions of the OT which, for von Pad, constituted the proper subject of OT theology. Methodologically, this meant for him that the retelling of this confessional story of the OT traditions was the most legitimate form of theological discourse on the OT. This conviction is reflected in the manner in which von Rad organized and presented his material. Vol. I consists of two parts: a concise survey of the history of Israelite religion, followed by a theology of Israel's historical traditions. After a brief chapter on methodology, the latter are treated under the following three headings: "The Theology of the Hexateuch," "Israel's Anointed" (covering the Deuteronomistic and the Chronicler's history), and "Israel Before Yahweh (Israel's Answer)," which covers the Psalms and the Wisdom Literature. Vol. II is divided into three parts as follows: "General Considerations in Prophecy," "Classical Prophecy" (which treats the OT prophets from Amos on in their sequential appearance down to and including apocalyptic literature), and "the Old Testament and the New" (in which the author sets forth his understanding of the relationship between the testaments).

Von Rad's approach to the subject has often been labeled a salvation-historical one, and in one sense this is correct. It must be remembered, however, that for him *Heilsgeschichte* did not refer primarily to Yahweh's saving activity in Israel's actual history as critically reconstructed by the historian, but to the kerygmatic history as confessed by the OT writers and traditionalists. For von Rad, as for many other OT scholars, a considerable gulf exists between these two histories. For this reason, von Rad's approach to OT theology can also (and perhaps more accurately) be labeled a tradition-historical, rather than a salvation-historical, one. At any rate, von Rad's OT theology made a considerable impact on the field, not only because it was a significant departure from more traditional methodologies, but because it was a well-written and stimulating book, characterized by profound erudition and theological sensitivity. His approach has succeeded in presenting a more differentiated and finely nuanced picture of the various theological perspectives found in the OT documents. On the minus side it must be said that his twofold division of the history of Israel into an actual and a confessional history, and his opinion that only the latter of these is of concern to OT theologians, are unsatisfactory and indefensible. Furthermore, his claim

that the OT presents no coherent theology, but only a wide variety of conflicting theologies, is exaggerated and excessively atomistic. In the long run, it is doubtful that von Rad's tradition-historical approach to OT theology will replace more systematic and conceptual approaches to the subject. In all likelihood it will be no more than a contributing perspective or intermediate step, albeit a very important one, in the construction of more conceptually oriented theologies of theOT. In support of such a contention, it might be noted that most of the OT theologies which have appeared in the past 30 years since the appearance of von Rad's work have not followed him in his basic approach.

Before we bring this survey of the history of the discipline to a conclusion, we must comment briefly upon one particular phase in its most recent history.

6. The "Biblical Theology Movement" and the Alleged "Crisis" in OT Theology. The revival of biblical and OT theology in this century brought it to a position of prominence in the larger theological enterprise during the 1940s and 1950s, which has led some to speak of a "biblical theology movement" during that era. According to Childs (1970: 32–50), this movement was characterized by a rediscovery of and emphasis on the theological dimensions of the Bible; the unity of the Bible; the revelation of God in history; a distinctive biblical mentality, involving a sharp dichotomy between Greek and Hebrew thought and stress on semantic approaches to the content of the Bible; and emphasis on the contrast between the Bible and its ancient environment. Barr (*IDBSup*, 105) adds a certain antiphilosophical bias as another characteristic feature of this movement. Childs (1970: 61–87) describes the rapid dissolution of this movement during the 1960s. It was brought on, according to him, by both changing perspectives within the field of biblical studies and by pressures external to the field. Chief among the latter were the new secularity, developments in the social sciences, and a gap between theology and experience. Since the appearance of Childs' book, it has become fashionable in some circles to talk of a "crisis" in biblical and OT theology. The added perspective of the past two decades, however, make it appear that such assessment is in need of considerable revision. Those who have bought into the "crisis" talk have overstated their case. They have also been guilty of confusing and oversimplifying certain issues which need to be differentiated more carefully. The following observations are offered in support of this contention.

First of all, it needs to be said that Childs' description of a biblical theology movement in the 1940s and 1950s is a bit oversimplified and hence misleading. It focuses too exclusively upon the American scene, and even there lumps together biblical scholars, theologians, and theological positions which need to be differentiated more carefully. Even more misleading is the implicit equation of the biblical theology movement with the much wider discipline of biblical theology (Smart 1979: 18–30).

Secondly, it must be remembered that the term "biblical theology" (and hence "OT theology" and "NT theology") has functioned traditionally in at least two distinct, albeit related, senses. By it one may mean either (a) a type of theology which is consonant with the Bible; or (b) the theology (or theologies) contained in the biblical documents. Biblical theology of type (a) is a systematic theology which uses the Bible as its chief, if not sole, source and norm, whereas type (b) is more of an exegetical and descriptive enterprise. Childs' description of the biblical theology movement and its crisis operated more with a type (a) definition of biblical theology. Thus, whatever crisis there may have been applied to a narrow segment of the enterprise, that is, to Childs' "biblical theology movement," rather than to biblical theology of the exegetical and descriptive variety. The title of Childs' book appears to be somewhat of a misnomer.

Thirdly, we feel that it is more accurate to say that whatever crisis existed in the 1960s was not uniquely one in biblical theology as such, but rather a crisis of faith and theology in general. Scholars, clergy, and laity alike had bandied about too glibly theological concepts and categories, biblical or otherwise. Then they woke up one day and discovered that a serious gap existed between their theological abstractions and their faith experience; and so they became disenchanted with "biblical theology" and cast about for greener intellectual pastures. The theological enterprise itself at one point became uncertain about its identity and purpose, as evidenced by the now strangely quaint and dated "Death of God" controversy. To the extent that biblical theologians are human beings who, like anyone else, imbibe of the general cultural

and philosophical currents of their age, that general malaise or crisis may have been in some forms of biblical theology also, but it did not belong uniquely to that discipline.

For all these reasons we believe that it is inaccurate to speak of biblical theology as being in a state of "crisis" or dissolution during the 1960s. It would be more accurate to speak of it as entering a period of transition and reassessment. After three decades of breathless expansion, culminating in what Dentan (1963: 72–83) has termed the "golden age of the fifties," biblical and OT theology reached a plateau where it needed to reflect whence it had come and whither it was going. Some of its cherished assumptions were tested and found wanting; certain in-course corrections had to be made; new data and perspectives provided by ancillary biblical disciplines had to be sifted and accommodated; and differing methodologies needed to be assessed and evaluated.

While few new OT theologies were produced during the 1960s, more than a dozen such works have appeared since the beginning of the 1970s, which is an unprecedented number for any comparable period during the entire history of the discipline! To this number of full-length theologies must be added the flood of articles and monographs which deal with some specific topic or aspect of OT theology and which today number in the hundreds and thousands of items. All this suggests that the discipline of biblical theology today is alive and well.

7. Summary: Two Fundamental Dialectics. Our survey of the history of the discipline has shown that OT theology has undergone a number of significant changes during the past four centuries. These were brought about chiefly as the result of two related, though distinct, fundamental dialectics operative in the history of the discipline, which continue to be operative in the discipline and stand at the center of contemporary discussions about OT theology. The first dialectic has to do with the nature and task of OT theology, that is, whether it is primarily *descriptive* or *normative* in character. We saw how biblical theology started out as a normative discipline, designed to undergird the dogmatic assertions of orthodox Protestantism. Under the impact of Pietism and the Enlightenment, biblical theology asserted its status as a distinct theological discipline and became more self-consciously descriptive in character. The excesses of vulgar rationalism, however, obscured the legitimate gains of the descriptive approach by subjecting OT theology to the normative straitjacket of philosophical rationalism. The impact of 19th-century historicism, on the other hand, for a time displaced any kind of normative OT theology with a purely descriptive history of the religion of Israel. Finally, in the mid-20th century, the normative aspects of OT theology were given greater prominence again.

The second fundamental dialectic operative in the history of the discipline has to do with the question of methodology; that is, what is the most effect way to present the theological content of the OT. This dialectic may be designated by the words "systematic-conceptual" versus "historical-genetic" (the terms "synchronic" or "crosscut" versus "diachronic" are also used in the literature). A systematic-conceptual approach to OT theology sets forth the theological content of the OT in terms of ideas or categories drawn either from the OT itself or from somewhere else. A historical-genetic approach, on the other hand, seeks to describe the theological content of the OT in its historical and sequential unfolding, either in terms of the actual history of Israel or of the history of the traditions and literature of the OT. Our historical survey showed how biblical theology started out with an exclusively systematic-conceptual framework; that is, the theological content of Scripture was fitted into the rubrics of Protestant dogmatics. With the rise of federal or covenant theology, and later *Heilsgeschichte,* the rigorously dogmatic methodology was abandoned in favor of a more historically oriented one. Historical-genetic methodologies became most pronounced during the late 19th and early 20th centuries. And in the last 50 years, the pendulum has swung back toward more systematic methodologies.

B. Current Issues and Problems

As one surveys the sizable literature on OT theology during its revitalization in the mid-20th century, one cannot help but note that a few key issues have stood at the center of the discussion. Some of these, like the two fundamental dialectics identified above, have been with us for a long time; others have come to the fore only more recently. There appear to be at least four central issues that warrant some discussion.

1. Descriptive and Normative Dimensions. At issue here is the very nature and purpose of the discipline. Is OT theology to be construed as a purely descriptive discipline, the chief task of which is to describe the theological ideas of the OT irrespective of their abiding significance and continued meaning today? Or must any credible OT theology also press on to deal with "contemporary meaning" questions? Our historical survey above has shown that this fundamental question has received varying answers throughout the history of the discipline. It remains for us to assess where we stand on this issue today.

Following the demise of the theological consensus represented by the so-called "biblical theology movement," the pendulum swung toward a self-consciously descriptive approach to OT theology. For a while it appeared that the program of a purely descriptive biblical theology advocated by Stendahl (*IDB* 1: 418–32) and others would carry the day. Certainly much valuable work in OT theology was produced under its banner. More recently, however, dissatisfaction with a purely descriptive approach has become more vocal again, and calls have been issued for the inclusion of normative dimensions in the enterprise of biblical and OT theology (so, for instance, Childs 1970; 1985; de Vaux 1971; Clements 1978; Martens 1981; Hanson 1986; and others). Should such calls be heeded, or should they be ignored as an illegitimate intrusion of the concerns of systematic theology into the discipline of OT theology? Will OT theology again be pressed into the service of dogmatics, to the point where its independent witness will be muted or falsified? This danger is certainly real, as the history of the discipline has amply demonstrated. One must proceed cautiously and with proper safeguards against the uncritical confusion of descriptive and normative concerns. Nevertheless, when all is said and done, it can be argued that a normative dimension belongs legitimately to the discipline of OT theology. In support of this view, the following considerations are advanced.

First of all, it should be noted that even a self-consciously descriptive OT theology embodies certain normative dimensions in the manner in which biblical data are selected, interpreted, and arranged in some coherent fashion. The process of determining the essential and fundamental structures of OT faith inevitably involves the interaction of biblical data with the cultural, philosophical, and theological presuppositions of the interpreter. Complete neutrality and objectivity is an illusion. The recognition of this fact, however, does not provide us with an excuse for unbridled bias. On the contrary, one must strive to be as objective and as faithful to the biblical data as one can, and to differentiate carefully between these data and one's own presuppositions. The heavy-handed imposition of philosophical or theological straitjackets on the biblical data must be strenuously resisted as being inimical to a vital and creative OT theology.

A second reason for insisting on some normative dimension in OT theology is suggested by the very nature of the biblical writings, for they seem to demand some kind of commitment or response on the part of the interpreter. Even if complete neutrality and detachment were feasible, this would not be true to the intentions of the biblical text, which presupposes the reality of God in relationship to human beings and the world, and which seeks to elicit a personal response on the part of the reader. It is for this reason also that the historical-critical method in and of itself, in spite of the impressive and lasting results which it has achieved, has proven to be an inadequate tool for doing biblical OT theology. Any approach to Scripture which views the world as a closed system of natural cause and effect, which operates with the principle of analogy as if it were an absolutely inviolate norm, and which rules out by definition the possibility of miracle or divine activity in human affairs is incapable of producing a truly biblical OT theology.

A third consideration which has been advanced in support of the contention that normative concerns rightly belong to the discipline of OT theology has to do with one's understanding of the term "theology." If theology is in any sense concerned with "truth for us" or truth for the religious community in which the OT is a foundational faith document, then OT theology cannot be content merely to describe the religious ideas which the ancient Hebrews held at some point in their history. Inevitably it must press on to discern what the abiding truth is today for those who consider themselves to be the spiritual descendants and heirs of ancient Israel. R. E. Clements (1978: 6–7) recently has argued that theology is something more than the study of religious ideas in the sense that it also offers some measure of evaluation of their truth. It is in the very nature of theology to concern itself with living faith rather than the history of ideas. Against this

view, it may be argued that the word "theology" does not always have such normative connotations, but that it is also used in a more descriptive and noncommittal sense, as in the expressions "historical theology" or "Hindu theology," which may refer to a description of the belief system of a person or group of persons by a more or less sympathetic bystander who does not necessarily share that belief system. Without denying that such a description "from the outside," as it were, can yield important insights, we are inclined to doubt that OT theology can or should be restricted to such a specialized understanding. To be sure, there are those who would be content to restrict OT theology to being simply one of several historical or comparative theologies. But for most members of the faith communities for whom the OT is a normative foundational document, OT theology inevitably suggests connotations of abiding truth value, and any OT theologian worthy of the name is expected to address these in some fashion.

This leads to a fourth and final consideration in support of our contention that some normative concerns rightly belong to the discipline of OT theology—a consideration that is of a more pragmatic nature. The chief reason why the Bible has been preserved, read, and cherished for all these centuries is because it was considered in some sense to be God's word to us. People have turned to it in order to find God and to discern meaning and purpose for their lives. Thus, "meaning questions" will inevitably rise in the mind of most students of Scripture, and it would be a disservice to them to ignore these. What, for instance, is the meaning and significance of holy war in the books of Joshua and Samuel, and how can this inform our current concerns with issues of war and peace? Does God repent or have a change of mind, as the book of Exodus seems to assert, and what does this do to traditional notions of God's immutability? Does God bring about both good and evil, as some of Israel's poets seem to suggest? How are we to understand the *lex talionis*, or what is the theological significance of contradictions in the OT law codes? Does God indeed reward good and punish evil, and what must we do to gain favor in God's sight? Biblical theologians who ignore such meaning questions and adhere solely to the descriptive dimensions of their task will frustrate their readers or lose them altogether.

There are those who argue for a strict division of labor between theological disciplines, insisting that it is the task of systematic theology to deal with the question of what it means for us now, whereas OT theology need only deal with the question of what it meant to ancient Israelites back then. But this dichotomy is both unsatisfactory and impractical. The hermeneutical task cannot be divided up that neatly. Most students of the Bible prefer to have their meaning questions addressed as these arise from their reading of the text, rather than being referred to some other discipline, the agenda and theological discourse of which may be informed by other than exegetical concerns. Furthermore, the field of biblical studies has become so complex that few systematic theologians have either the interest or the energy to be fully conversant with developments in biblical exegesis. Here OT theologians can perform a valuable service for systematic theologians by presenting them with a theological synthesis of the results of biblical exegesis in a form which is more readily accessible and useful to the latter. In order to do this effectively, however, biblical scholars in turn must become more conversant with theological perspectives and be willing to move beyond merely antiquarian concerns.

For all of the reasons indicated, we believe that a normative dimension belongs appropriately to the discipline of OT theology. This, however, in no way is meant to minimize or detract from the descriptive task, which must always remain the heart of the enterprise. As OT theologians attempt to deal with present meaning, they must not lose their interest and respect for the descriptive task, if OT theology is to remain a viable and creative enterprise. Under no circumstances must it be allowed to become captive to either a narrowly meaning-oriented philosophical or theological system, or an ideological historicism which refuses to deal with meaning questions in any form. In the light of the descriptive/normative dialectic inherent in OT theology, an attempt should now be made to locate the discipline of OT theology vis-à-vis the two disciplines with which it had to contend most for its independence and integrity.

OT theology is a boundary discipline which shares some common ground with the history of the religion of Israel on the one hand and systematic theology on the other. It functions best when it maintains the tensions between these two disciplines and resists the temptation of being too closely identified with either.

The chief source and norm for OT theology is the canonical books of the OT. In seeking to understand the theological concepts and ideas contained in these, OT theology may also consult extracanonical literature and archaeological data, but these in themselves will not become a basis for theological construction. For example, the understanding of Yahweh reflected in the Elephantine papyri or in the inscriptions of Kuntillet ʿAjrud is of interest to OT theology in the sense that it can provide background or contrast against which the biblical understanding of God can be seen more sharply, but it does not become part of a normative definition of the latter. A history of the religion of Israel, however, may rightfully draw upon extrabiblical sources for its reconstruction of the beliefs and practices of Israelite religion. Systematic theology, on the other hand, shares with OT theology its use of the canon as a source and norm, but in addition it recognizes certain others, such as tradition, human knowledge and experience, and reason, as valid sources and norms for constructive theology.

As regards its method of operation, OT theology is an exegetical and theological discipline; that is, it deals with the grammatical, historical, and literary meaning of biblical texts, but with special attention to their theological significance and meaning as discerned by the theologian under the illumination of the spirit of God. The history-of-religions approach operates more exclusively from a phenomenological and historical perspective. Systematic theology shares with OT theology its concern for the theological meaning of Scripture, but it is at the same time more philosophically and logically oriented than OT theology.

As regards the organization of data, there is considerable variation. In general, OT theology follows a combination of conceptual and tradition-historical principles in organizing its materials, whereas the history-of-religions approach generally employs historical and genetic principles of organization. Systematic theology, on the other hand, seeks to construct logically coherent conceptual systems. OT theology is much less interested in system building and is able to live with a lot more ambiguity and diversity of theological perspectives. It thus remains truer to Scripture, which does not come to us in the form of a logically coherent system of theology.

As regards the respective hermeneutical concerns of these disciplines, the history of religions is primarily, if not exclusively, descriptive in the sense that it seeks to describe a historical phenomenon like the religion of ancient Israel. Systematic theology, on the other extreme, is primarily concerned with normative meaning questions; that is, what does the OT mean for us today in the context of our respective belief communities? OT theology falls somewhere in between these two. It is both descriptive and normative in the sense that it must not only ascertain what the OT documents meant in their own historical context, but also press on to reflect on what they can mean for us today in our own context.

The location of OT theology as a "boundary discipline" between systematic theology and the history of religions as sketched in the preceding paragraphs can be summarized in tabular form:

RUBRIC	*HISTORY OF RELIGION*	*OT THEOLOGY*	*SYSTEMATIC THEOLOGY*
Sources & norms:	biblical and extra-biblical, literary and archaeological data	the canon of the OT	Scripture, tradition, reason, human experience and knowledge
Methodology:	phenomenological and historical	exegetical and theological	theological and philosophical
Organization of material:	chronological and genetic	conceptual, topical, historical and tradition-historical	systematic and logical
Hermeneutics:	descriptive: what was it and what did it mean?	descriptive and normative: what did it mean and what might it mean for us today?	normative and constructive: what does it mean in the context of this faith community?

While these distinctions are not absolute but allow for a considerable amount of overlap as demonstrated by the history of the discipline, this schema suggests a range on the descriptive/normative spectrum at

which OT theology seems to function best and at which it may be legitimately differentiated from the history-of-religions approach on the one hand and systematic theology on the other.

2. Methodology. Assuming that OT theology legitimately includes both descriptive and normative dimensions, the question still remains how the manifold and diverse theological witness of the OT can best be organized so as to present a reasonably coherent and comprehensive picture of the faith structure of the OT. Our historical survey has shown that methodologies have fluctuated between systematic-conceptual and historical-genetic approaches, or varying combinations thereof, and the same is still true of recent OT theologies. Within that fundamental dialectic, however, many different schemata of organization are possible. No one particular schema has been able to dominate the field or win universal assent, as the following analysis of recent OT theologies since Eichrodt and von Rad will demonstrate.

a. T. C. Vriezen. For Vriezen (1970) the central task of OT theology is to describe the characteristic features of the message of the OT and to reflect upon that message from the viewpoint of the Christian faith. His book is divided into two parts. The first part is devoted to an examination of the place of the OT in the Church and its significance for Christian theology. Nearly a third of the book is devoted to this general topic. If one wonders why the author devoted so much space to this subject, it is probably because he wished to restore the OT to its rightful place in Christian theology after a period of serious neglect and devaluation (it must be remembered that the first Dutch edition appeared in 1949).

In the second part of his book, Vriezen turns to the actual delineation of the theological content of the OT. It is divided into four chapters, in which the material is presented in an essentially conceptual fashion under the following four headings: (1) the nature of the knowledge of God in the OT; (2) the intercourse between God and man; (3) the community of God; and (4) the future hope of the community of God. Vriezen essentially follows the cross-section approach pioneered by Eichrodt, except that the overarching central theme of the OT for him is not covenant, but communion between God and humanity. With this emphasis Vriezen intentionally sought to counter von Rad's denial of a theological center of the OT, as well as the atomizing tendencies inherent in the latter's tradition-historical orientation. Vriezen also made a conscious effort to differentiate OT theology from the history of Israelite religion, which for him were separate disciplines showing distinct differences in function, scope, and methodology. According to Vriezen (1970: 147), OT theology is a Christian theological discipline whose task is to delineate the characteristic features of the message of the OT, both in itself and in its relation to the NT; whereas the history of Israel's religion is a historical discipline seeking to offer a picture of the religion of Israel in both its historical development and in its innermost essence and character. In accordance with this definition, Vriezen went on to produce a book on Israelite religion (1967). He is one of a handful of scholars to have produced both an OT theology and a history of the Israelite religion.

b. W. Zimmerli. Like Vriezen, Zimmerli follows a basically conceptual approach in the ordering of his material. But within that overarching structure, he is much more tradition-historically oriented than the former. His understanding of the nature and task of the discipline is also not as confessional as Vriezen's was. For Zimmerli, OT theology has the task of presenting what the OT says about God in a coherent whole. It must deal with the most important narrative complexes (which for him, as for von Rad, are the Hexateuch and the Prophets), but at the same time it must also lead readers "to bring together in their own minds the diverse statements the OT makes about God, who wishes to be known not as a manifold God but as the one Yahweh" (1978: 10). The self-revelation of Yahweh as formulated in the First Commandment may thus be said to be the unifying center of OT theology. This central theme is reflected in the organization of his book, which is divided into five major sections. The first one, entitled "Fundamentals," deals with Yahweh under the aspects of the revealed name, the God of Israel since Egypt, the God of the Fathers, Creator and King, Election, Covenant, and Commandment. The second part deals with "The Gifts Bestowed by Yahweh," among which are war and victory, land and blessing, God's presence, and charismata of leadership and instruction. The third part analyzes "Yahweh's Commandment," and the fourth part deals with the topic of "Life Before God." The latter, dealing with the themes of obedience, praise, lamentation, and wisdom, is very much reminiscent of von Rad's section "Israel Before Yahweh (Israel's Answer)" (1962–65, I). The fifth and last major part of Zimmerli's OT

theology is entitled "Crisis and Hope." It is chiefly devoted to the Prophets, but includes brief sections on the primeval history, the historical narratives, apocalypticism, and a concluding chapter on "The Openness of the OT Message."

In spite of the topical organization of his material, Zimmerli's approach to the subject stands much closer to von Rad's than to Eichrodt's or Vriezen's. In large stretches his OT theology reads like a miniature von Rad, though he is more interested in drawing out the overarching unity of the OT's understanding of God than von Rad, who was content merely to delineate the various theologies of the major tradition complexes of the OT.

c. G. Fohrer. Fohrer is another contemporary OT scholar who, like Vriezen, produced both an OT theology and a history of Israelite religion, though in reverse sequence from Vriezen. Fohrer's *History of Israelite Religion* (Eng 1972) appeared in German four years before his OT theology. It is a substantive work which made a significant contribution to the field. A brief look at it may help us put Fohrer's understanding of OT theology into sharper perspective. According to Fohrer, the purpose of presenting a history of Israelite religion is to depict the course of this religion as one among many others, without theological value judgments or apologetic concerns. Careful attention must be given to both the manifold changes this religion underwent during the course of its history and the common elements which it exhibited in all periods and which make it possible to speak of Israelite religion as a single entity distinct from others. Following a strictly historical and chronological principle of arrangement, Fohrer's *History of Israelite Religion* is divided into four parts: (1) the religion of the earliest period (patriarchal times through the era of the judges); (2) the period of the monarchy; (3) the exilic period; and (4) the postexilic period down to the era of the Maccabees.

Israelite religion arose as the synthesis of two basic given religious elements as modified by a series of five major religious impulses. The two basic givens were the nomadic clan religion of the patriarchs and Canaanite nature religion. The five major religious impulses which determined the development of Israelite religion were: (1) Mosaic Yahwism; (2) the monarchy; (3) the prophetic movement; (4) Deuteronomic theology (seen as a consequence of the first three impulses and a new impulse in its own right); and (5) exilic prophecy and incipient eschatology. In spite of the developments, tensions, and changes which Israelite religion underwent, it also exhibited certain constants throughout its long history. Fohrer identifies these as a personalistic structure of faith; the correlation between divine and human activity; the notion of God's present action among nations and people; the demand for human conduct which is consonant with the divine will; the belief in the sovereign rule of God; and God's communion with humanity, to be realized in the lives of both individuals and nations.

Fohrer's delineation of the structural constants in the religion of Israel is of particular significance, for it becomes a point of contact between his history (1973) and his theology (1972), where they are taken up again in Chap. 6 as "basic elements of OT faith" which run through the entire OT. From this, one may gain an important insight regarding the relationship of the two disciplines: the point at which OT theology and the history of Israelite religion show the greatest degree of affinity, and at times become virtually indistinguishable, is in the delineation of the abiding or fundamental structures of Israelite or OT faith.

With this we must turn to a closer examination of Fohrer's OT theology. It consists of seven chapters and follows an essentially conceptual and topical method of presentation. While the descriptive side of the task is not neglected, the normative and constructive dimension is very much in evidence throughout his book, much more so than in most recent OT theologies. The first two chapters of the book are taken up with what might be termed prolegomena to an OT theology. Chap. 1 reviews the various ways in which the OT has been interpreted down through the ages. Most of these are judged by him as erroneous or improper, for they are rooted in questionable dogmatic presuppositions. The OT faith must be understood in its own right and in its various historical manifestations, where it is permissible, however, to differentiate between what is of abiding theological significance and what is merely peripheral and culturally conditioned and time-bound. Unfortunately, Fohrer fails to inform the reader by what yardstick that is to be measured.

Chap. 2 deals with the question of the OT and revelation. Fohrer argues that the OT as a document or book cannot be equated with revelation. Revelation happens only in the concrete encounter between God and human beings. That is, it is personal experience, and only the one who experiences it can testify to it or describe it. Consequently, the OT is at best a witness or testimony to acts of revelation. Even the prophetic word as recorded in Scripture is already a mixture of divinely given insight as well as human perception, integration, and digestion. It is obvious that Fohrer operates with a very subjective understanding of revelation. However, the mere fact that he is speaking about revelation at all and allows for its occurrence shows how much he is operating at this point as a constructive theologian, rather than simply as a descriptive historian of Israel's religion.

Chap. 3 is organized under the philosophical category of *Daseinshaltung* ("attitude toward existence"). He describes six types of attitudes toward existence, all of which are found in the OT: magic, cultic, legal, national-religious (election faith), sapiential, and prophetic. These are then evaluated by him in terms of their merely temporal and transtemporal or abiding value and significance. Magic was purely temporal, an inappropriate attempt to manipulate the divine world. The priestly cultic and legal attitudes toward existence had some transtemporal significance insofar as they overcame magic and attempted to revitalize Mosaic faith in a changed cultural milieu. But they too were beset by problems, leading in turn to a superficial faith which sought to manipulate the deity for selfish or nationalistic ends. The same was true when genuine election faith was usurped by national-religious ideology. The sapiential attitude is found wanting because it was a mere utilitarian morality. This leaves the prophetic attitude toward existence, which for Fohrer represents the high point of the history of OT faith. It transcended all the others and is characterized by faithful trust and obedient service rooted in complete communion with God. Prophetic existence, according to Fohrer, was the reappearance of Mosaism in a purified form. Fohrer's lifelong preoccupation with Israel's prophets may be partly responsible for this one-sided valuation of prophetic existence. On the other hand, one cannot help but feel that his low esteem for Israel's cultic and legal traditions may also be the result of a long-standing theological bias found in much of Lutheran Protestant OT scholarship.

In chap. 4, which is entitled "Unity in Diversity," Fohrer turns to the question of whether OT faith has a center around which everything else revolves. After noting von Rad's denial of such a center, and after rejecting various centers proposed by other OT scholars, Fohrer proposes a dual center for OT theology designated by the concepts of "rule of God" and "communion with God." These form the unifying core to which the diverse religious and theological concepts of the OT may be related. Corresponding to this dual concept of the rule of communion with God is a dual human response of fear and trust, or distance and relatedness, which is characteristic of OT faith. Here we see how one of the "constants" of Israelite religion which he isolated in his history of Israelite religion has become the center of his OT theology.

Chap. 5 deals with the power and ability of OT faith to absorb and transform ancient beliefs and practices, chiefly under the influence of the dual center isolated in the previous chapter. OT faith itself, however, even its understanding of the rule of God and God's will to communion, in turn underwent change and expansion.

In Chap. 6, "Developments," Fohrer discusses basic tendencies of OT faith which are not confined to one particular stream but which run through the whole of the OT because of their relatedness to the central concepts of the rule of God and communion with God. They are: (1) the personal structure of OT faith; (2) God's activity among people and nations; (3) God's action in and through nature; (4) a correlation between divine and human activity (the act-and-consequence scheme); (5) faith as righteous action; and (6) the "this-worldliness" of OT faith. As we noted above, most of these basic tendencies of OT faith had previously been identified by Fohrer as "constants of Israelite religion" in his earlier work. At this point, his two works coincide very closely.

But in the very next chapter, Fohrer goes far beyond what any history of Israelite religion could do and what few contemporary OT theologians have even attempted to do. In this final chapter, entitled "Applications," Fohrer's mode of operation becomes overtly normative and constructiv as he seeks to spell out how the fundamental insights of OT faith can be applied to fundamental human issues and

problems today. The meaning question is wrestled with under the following five major headings: (1) the meaning of the biblical prologue; (2) the state and politics; (3) social organization; (4) humanity and technology; and (5) the future of mankind.

Both of Fohrer's works are immensely stimulating and have made significant contributions to the field, especially as regards an appropriate differentiation between the disciplines of OT theology and the history of the religion of Israel. His work, however, is not without shortcomings. His descriptive work is at times idiosyncratic and insufficiently substantiated; his one-sided valuation of the prophets is excessive, and his lack of appreciation for Israel's cultic and legal traditions is deplorable. His conceptual categories are too limiting at times, and his theological biases too glaring. But his attempt to delineate the constants of Israel's religion or the basic tendencies of OT faith is highly commendable and worthy of emulation. His forthright and unabashed attempt to deal with contemporary-meaning questions belongs to the very core of the theological enterprise. One may frequently find oneself in disagreement with elements of both Fohrer's historical reconstruction and his normative theological construction, but one will rarely fail to be stimulated in one's own thinking by what he has to say.

d. C. Westermann. According to Westermann (1982), a theology of the OT has the task of summarizing what the OT as a whole and in all its parts says about God. Westermann agrees with von Rad that unlike the NT, which has a center in Jesus Christ, the OT has no other center to which various theological assertions could be related. It is important, however, to look at how the OT speaks about God. As the tripartite canon indicates, the OT speaks about God's acting and speaking in history, and about humanity's response to that divine acting and speaking. And this furnishes Westermann with a key to organizing his material in six parts. Part I, "What Does the OT Say About God?" deals with methodological issues and provides a brief précis of his approach to the subject. The next four parts form the central core of his OT theology. Part II, "The Saving God and History," deals with one fundamental kind of divine activity: God's rescue of the needy from distress. God's saving activity may take many forms and applies to all spheres of life in both its individual and corporate dimensions. God's saving activity in the Exodus event at the beginning of Israel's history became determinative for all subsequent history.

Part III, "The Blessing God and Creation," deals with another fundamental kind of divine activity. It refers to God's ongoing, gradual, and less spectacular action in creation and in the daily flow of life, which is known as blessing in the Bible. The history of this blessing theme is then traced by Westermann from the patriarchal narratives and the Balaam oracles through Deuteronomy, the institution of kingship and the cult, the prophets, and the book of Job. Words associated with the blessing motif, such as "peace," "success," "prosperity," and "protection," are analyzed. Westermann's distinction between God's saving and blessing activity is an important one, which has frequently been neglected in more salvation-historically oriented treatments of the OT. It is a real gain which deserves to be preserved and explored more fully in OT theology. Curiously, though, Westermann does very little with wisdom in the OT, even though earlier in his book he had, quite rightly, located it under the rubric of creation theology.

Part IV, "God's Judgment and God's Compassion," begins with an analysis of the OT concept of sin and the vocabulary associated with it. The act/consequence theme is explored, as is the notion of forgiveness. This is followed by a discussion of the judgment theme in the Prophets, which addressed itself to all areas of Israelite life. The prophets, however, were also messengers of a saving, healing, and forgiving God, which leads Westermann to a discussion of God's compassion. The chapter concludes with a brief discussion of the apocalyptic, which is predominantly concerned with the future.

Part V, "The Response," analyzes various human responses to God's words and actions. Westermann distinguishes three basic forms which this response took: words, actions, and reflection. The response in words consisted of prayers, praise, and lamentation. The response in action could find either legal or cultic expression, that is, by obedient action in response to commandment, or in the life of corporate worship, including holy places, times, and mediators. Unlike Fohrer, Westermann here finds a positive valuation for Israel's legal and cultic traditions within his OT theology. The third type of human response to God's initiative is reflection. This could take the form of pious meditation on God or God's Torah (as

in Psalms 1 and 119), or in more extended theological reflection. Examples of the latter would be the major historical traditions of the OT, such as the Yahwistic work, which is rooted in praise over experience of deliverance; the Deuteronomistic History, which is a reflection on the experience of judgment; and the Priestly work, which is rooted in the fundamental reality of God's presence in worship. He says nothing about the Elohistic tradition or the Chronicler. Westermann's subsuming of the primal histories of the OT under Israel's response is a major tour de force, which makes one wonder how meaningful the categories of "Yahweh's activity" and "Israel's response" really are when dealing with OT documents in an OT theology. Can these two entities be so neatly distinguished? Are not all OT documents at the same time records of both God's actions and Israel's response?

Part VI, "The Old Testament and Jesus Christ," is the last chapter in Westermann's book, in which he explores the nature of the relationship between the OT (and the faith expressed therein) and Jesus Christ. He does this from the tripartite perspective of the Hebrew canon under the following headings: (1) "The Historical Books and Jesus Christ," (2) "The Prophetic Proclamation and Jesus Christ," and (3) "Christ and the Response of God's People." Both God's saving and blessing activity find parallels in the NT story of Jesus Christ, as does the prophetic message and experience. Israel's response in words and actions as expressed in the psalms and in commandment and law also finds many echoes in the NT. Most of the comparisons which Westermann makes in this concluding chapter are predominantly of a descriptive nature and merit further exploration and consideration by objective scholarship. Unlike many earlier OT theologies written by Christians, he does not simply use the OT for purposes of negative contrast; on the contrary, he frequently attempts to correct traditional Christian misconceptions of the OT. Throughout one gets the impression that he is concerned to restore the OT to full and equal partnership in the theological dialogue between the testaments.

Westermann's OT theology, like that of Zimmerli, is only a *Grundriss* ("basic elements"). It is a brief but very compact treatment of the subject, though one that is highly stimulating and thought-provoking. As regards his methodology, in spite of his emphasis on the historical character of the OT and the action-oriented nature of its God-talk, it is fundamentally conceptual and topical, rather than historical-sequential. This appears to be the prevailing trend in the field.

e. J. L. McKenzie. McKenzie's work (1974) is the first by a Roman Catholic scholar to break with the traditional schema of dogmatic theology. Instead, he follows a conceptual approach with topics abstracted from the OT itself. The basis on which his topics are chosen is the amount of coverage which they receive in the OT and the degree of "profundity" they exhibit within the totality of Israel's experience. On the basis of this admittedly somewhat subjective criterion, McKenzie devotes a chapter to each of the following seven topics: the cult, revelation, history, nature, wisdom, political and social institutions, and the future of Israel. Within this larger systematic and topical scheme, McKenzie occasionally finds it expedient to lapse into a more historical-sequential scheme, as when under the chapter on revelation he treats some of the prophets sequentially and book by book. This only reinforces what we have had occasion to observe previously, namely, that a single methodology is rarely adhered to rigorously, and that most OT theologies today exhibit a mixture of both systematic-conceptual and historical-sequential methodologies. Other distinguishing features of McKenzie's OT theology are the heavy emphasis he gives to Israel's cult and his refusal, explicitly at least, to relate the OT to the NT. As regards the former, one cannot help but wonder whether his emphasis on the cult is entirely due to the prominence given it in the OT, or whether the author's Roman Catholic orientation may also play a role in this. As regards his claim that he wrote this OT theology as if the NT did not exist, it is at least debatable whether the application of his criterion of "profundity" is not at times implicitly influenced by Christian values and NT perspectives.

f. W. C. Kaiser, Jr. Written by an American OT scholar and dean of Trinity Evangelical Divinity School in Deerfield, Illinois, Kaiser's theology (1978) is a self-conscious attempt to move beyond the methodological impasse represented by Eichrodt and von Rad. He attempts to achieve this by combining both conceptual and historical approaches to the subject in a harmonious whole. With von Rad, the author agrees that an OT theology must draw its approach from the historic progression of the canonical text of

the OT. But unlike von Rad, he places much greater confidence in the historical accuracy and reliability of Israel's narrative traditions. Unlike von Rad also, but in agreement with Eichrodt and others, Kaiser believes that the various theological assertions of the OT are united by a common theological theme, which like a leitmotiv runs through them all and unites them in a common bond and purpose. The author thus belongs among those who believe in the existence of a theological center and organizing principle in OT theology. For Kaiser this is the theme of God's promise and blessing, first enunciated in Gen 12:1–3 and textually reiterated and confirmed throughout the canon by means of a variety of related words and concepts.

Accordingly, the main part of Kaiser's OT theology is organized into eleven chapters which follow a historical-sequential order, but are grouped around the central theme of promise as follows: Prolegomenon to the Promise: Prepatriarchal Era (Chap. 5); Provisions in the Promise: Patriarchal Era (Chap. 6); People of the Promise: Mosaic Era (Chap. 7); Place of the Promise: Premonarchical Era (Chap. 8); King of the Promise: Davidic Era (Chap. 9); Life in the Promise: Sapiential Era (Chap. 10); Day of the Promise: 9th Century (Chap. 11); Servant of the Promise: 8th Century (Chap. 12); Renewal of the Promise: 7th Century (Chap. 13); Kingdom of the Promise: Exilic Prophets (Chap. 14); and Triumph of the Promise: Postexilic Prophets (Chap. 15). The first four chapters of the book deal with issues of definition and method, and the final chapter addresses briefly the question of the connection between the OT and NT.

A look at this outline inevitably creates the impression of a certain artificiality in the organization of the biblical data, which is confirmed by a close reading of the actual contents of these chapters. For instance, the Abrahamic and Davidic convenants are stressed to the neglect of the Mosaic covenant, which incidentally, Kaiser considers to be an outgrowth of the Abrahamic covenant. Given the author's choice of the promise motif as his theological center, this is not surprising at all, but it is highly doubtful that it reflects either historical reality or the literary witness of the OT. Also problematic is Kaiser's association of the topic "life in the promise" with the sapiential tradition and the assigning of all of the latter to the Solomonic era. Israel's cultic traditions are insufficiently treated, and it is also highly questionable to treat the postexilic developments of Israelite faith under the rubric of prophecy. Another serious shortcoming of Kaiser's OT theology is his failure to come to terms with the literary character of the material he is interpreting. Most of it is treated by him as if it were uniformly historical in character. Historical and literary-critical problems are bracketed out or ignored. This might have been less objectionable if the author had been content to claim merely a structuralist or canonical reading of the documents rather than a historical one.

In spite of these shortcomings, however, the book contains many valuable exegetical insights. The author is to be commended for his insistence on the exegetical nature of OT theology and that the overarching categories should be derived exegetically from the material itself. Certainly the theme of promise and blessing is an important one in the OT, the significance of which can be exegetically demonstrated over a wide range of literature, as Kaiser has done. But it, no less than any other single theological theme, is incapable of doing full justice to the wide-ranging and richly varied theological literature of the OT.

g. R. E. Clements. Clements' theology (1978), written by a British scholar and Baptist minister, originated in 1975 as a series of lectures intended primarily as a critique of then-existing OT theologies. Subsequently these were expanded to include the author's own suggestions as to what a theology of the OT should look like. This explains why a significant amount of space is devoted to methodological issues, whereas the author's own constructive treatment of the theological content of the OT is more in the nature of a brief sketch or outline rather than a full-fledged OT theology. Its eight chapters follow an essentially topical outline.

Chap. 1, "The Problem of OT Theology," deals with fundamental problems of the discipline as traditionally construed. Observing that OT theology traditionally has been a Christian undertaking, Clements questions why this is so and whether it is necessarily so. Against a purely descriptive approach, the author argues that theology by definition is something more than the study of religious ideas, for it

offers a measure of evaluation of their truth. While the historical-critical method is absolutely essential for OT theology today, it alone is not sufficient but must be complemented by theological perspectives. The canon is of theological significance for the discipline, as is the fact that we can observe already in Scripture a process of transition from cultic religion to the religion of a book. Clements rejects the methodological search for a uniform center for constructing an OT theology, but notes that ultimately it is the nature and being of God which establishes a unity in the OT.

Chap. 2, "Dimensions of Faith in the Old Testament," turns to an examination of four salient features of the OT which must be considered carefully before one attempts to elicit from it a particular theology. *The literary dimension* reminds us that the OT is not the product of any mne author but of many, and that it contains many literary types. *The historical dimension* reminds us that the OT consists to a large extent of historical narratives which speak of various levels of divine intervention and activity in the world; these have to be taken into account in uncovering the theological meaning of ancient biblical narratives. Changing and conflicting perspectives (e.g., the revolt of Jehu) can also be demonstrated, but the notion of "progressive revelation" must be used with caution. *The cultic dimension* reminds us that contrary to much modern Christian interpretation, the cult was not just a dispensable adjunct but the heart of Israelite religion. It so affected the ideas and language of the OT that it may be viewed as the cradle of biblical theology. Yet the conception of God also brought forth changes in the cult. Finally, *the intellectual dimension* reminds us that the OT arose in an ancient culture and setting which was very different from the modern world. In this ancient milieu the OT came in contact with three areas of the history of religious ideas—primitive thinking, mythical thinking, and the realm of magic—yet it effected significant changes in all of these areas as a result of its emphasis on the personal and moral nature of God.

After these preliminary hermeneutical considerations, Clements in the next four chapters of his book turns to an examination of the essentials of OT theology as he understands it. Chap. 3, "The God of Israel," deals with the being, names, presence, and uniqueness of God. Chap. 4, "The People of God," examines God's human partner under the rubrics of people and nation, election, and covenant. Chap. 5, "The Old Testament as Law," gives adequate recognition to the importance of Torah in the OT under the following four headings: "The Meaning of Tôrâh," "The Pentateuch as Tôrâh," "The Tôrâh and the Prophets," and "From Tôrâh to Law." Clements' emphasis on Torah is a welcome and much-needed corrective to many OT theologies written by Christian authors. Chap. 6, "The Old Testament as Promise," deals chiefly, though not exclusively, with the prophetic literature of the OT under the following fourfold subheadings: "Prophecy and the Judgment of Israel," "Prophecy and Hope," "The Forms of Prophetic Hope," and "The Promise in the Law and the Writings." Clements goes on to observe that for Christian interpreters the prophetic promise motif has always been more congenial to finding theological meaning and significance in the OT than the Torah motif (see the OT theology by Kaiser above). Yet both motifs are present in the OT and must be given their due significance in any OT theology. The author is to be commended for his evenhanded treatment of both themes. The sixth chapter concludes the author's attempt at constructing the outline of an OT theology as he understands it.

In the final two chapters of his book, Clements turns again to topics which belong to the category of prolegomena to an OT theology, rather than to its actual content. They deal with OT theology in relation to other theological disciplines, Chap. 7 dealing with "The Old Testament and the History of Religions," and Chap. 8 with "The Old Testament and the Study of Theology."

One may fault Clements' OT theology for the disproportionate attention given to the prolegomena-type issues, as over against the theological content of the OT. His failure to deal with the third part of the OT canon, except for a few scattered references to the psalms, is a more glaring omission and one which is not adequately explained. The acknowledged origin of the book may be cited in partial explanation of these imbalances. In spite of these shortcomings, however, the book contains many good insights and suggestions, which others may explore more fully. It certainly breaks some new ground, and for this reason alone must be judged to be an important contribution to the ongoing discussion about the nature and task of OT theology.

h. E. E. Martens. Written by the president of and professor of OT at Mennonite Brethren Biblical Seminary, Martens' OT theology (1981) represents a distinctive approach to the subject in that it seeks to construct an OT theology on the basis of a grid provided by a single text in Exod 5:22–6:8. In this passage, the author finds enunciated the central message of the OT in the concept of "God's design." God's design has a fourfold purpose: (1) the bestowal of blessing, consisting of both deliverance in history and blessing through the cult; (2) the formation of a covenant community; (3) the knowledge of God expressed in personal relationship; and (4) the gift of the land and the enjoyment of life in it. On the basis of this grid of God's fourfold design, the author then proceeds to lay out the theological content of the OT. The book is divided into four major parts. In the first part, the fourfold design is articulated on the basis of the Exodus passage and "earlier" anticipations of it in the primeval history and the patriarchal narratives. The second part examines the implementation of this design in the premonarchic era. The third part traces the testing of that design during the era of the monarchy. And the fourth part explores of the reaffirmation of that fourfold design in the postmonarchic era, including a brief glance at its reemergence in the NT books of Matthew and Romans.

From this outline it is apparent that the author's methodology is a combination of systematic-conceptual and diachronic approaches, whereby historical- and literary-critical questions are for the most part ignored in favor of a conservative acceptance of the historicity of the narratives. In spite of this shortcoming, however, the book provides many valuable insights into the meaning of the biblical text. The author also has a clear sense of the difference between the descriptive and constructive dimensions of his task. At several points scattered throughout the volume, there are sections specifically marked as "Theological Reflections," in which Martens explores the potential meaning and significance for today of biblical passages and themes just described. Martens' OT theology further confirms the confluence of synchronic and diachronic, descriptive and normative approaches to the subject, which we have had occasion to observe in many contemporary OT theologies.

i. W. H. Schmidt. The Werner Schmidt, who is professor of OT at the University of Marburg in Germany, has characterized his book (1983) as standing midway between a history of Israelite religion and a theology of the OT. Even a casual examination of its contents, however, reveals that the book is in fact a history of the religion of Israel, not an OT theology. First of all, the dominant and overarching approach to the subject is historical and genetic rather than systematic and conceptual. The four major subdivisions of the book are purely historical in nature: (1) nomadic prehistory; (2) the early period after the Conquest; (3) the period of the monarchy; and (4) the late period. The subsections under these headings deal for the most part with individual topics of a historical nature, such as the God of the Fathers, the wars of Yahweh, the tribal confederacy, the monarchy, prophecy, and the apocalyptic. Where more systematic concepts such as covenant, election, or the word of God appear at all, they are relegated to a brief excursus rather than being taken up in the main body of the text.

A second reason why this work is better classified as a history of Israelite religion is because it emphasizes heavily the notion of growth and change in Israel's religion during the course of its history, as well as its relationship and affinity to its ANE environment. To be sure, the author also describes that which distinguishes Israelite religion from other ancient religions (chiefly its understanding of God as reflected in the first and second commandments), but that fact in itself does not make Schmidt's book an OT theology. Any history of Israelite religion worthy of the name will also do that, as we have seen above (cf. Fohrer and Vriezen).

A third reason for judging this book to be a history of Israelite religion rather than an OT theology has to do with the exclusively descriptive nature of its analysis. There is no attempt at constructive theological synthesis or at making any kind of judgment regarding what are the normative and abiding elements of OT faith which might continue to inform the faith communities who view the OT as sacred Scripture.

The fact that this book deals chiefly, though by no means exclusively, with the history of the religious ideas (rather than the religious practices and institutions) of Israel does not make it an OT theology, as the author seems to assume. Even a history of religious ideas is still a history of the religion of Israel, albeit a more narrowly focused one. Schmidt's volume, for all intents and purposes, is very similar in conception,

structure, and emphasis to such recent histories of Israelite religion as those by Ringgren, Fohrer, and Vriezen, and might just as well have been labeled that. As such, it is well written and takes its place as a worthy equal among them.

j. B. S. Childs. Brevard Childs of Yale University has been an active participant in the debate about the nature and purpose of the discipline for many years (see Childs 1970). More recently, however, he has presented his own constructive attempt at an OT theology (Childs 1985). It is a book of rather modest dimensions; like most recent OT theologies, it is more in the nature of an "outline" rather than a full-fledged treatment of the subject. By the author's own admission in the preface, it is presented in a less technical form than his earlier commentary and introductions. Nevertheless, the subject matter is dealt with in sufficient detail to reflect adequately his understanding of it.

Childs follows essentially a systematic and topical method of organization. The roughly 250 pages of his book are divided into 20 brief chapters. The first two are methodological in nature, dealing respectively with the nature and history of the discipline and the meaning of revelation as applied to the OT. The theme of revelation is also the subject of the next two chapters, where the author examines the question of how God is known (Chap. 3) and what the purpose of God's revelation is in the OT (Chap. 4). The revelation of God is inseparably associated with the revelation of God's will. Consequently, the next four chapters are devoted to that subject under the following headings: The Law of God (Chap. 5); Knowing and Doing the Will of God (Chap. 6); The Theological Significance of the Decalogue (Chap. 7); and the Role of Ritual and Purity Laws (Chap. 8). The next five chapters examine various human recipients of God's revelation: The Recipients of God's Revelation (Chap. 9); Agents of God's Rule: Moses, Judges, Kings (Chap. 10); The Office and Function of the Prophet (Chap. 11); True and False Prophets (Chap. 12); and the Theological Role of Priesthood (Chap. 13). The theme of revelation, which loosely held together the first 13 chapters of the book, is not as apparent in the remaining 7 chapters, which deal with a sequence of unrelated topics as follows: Benefit of the Covenant: The Cultus (Chap. 14); Structures of the Common Life, dealing with various civil, legal, and military institutions (Chap. 15); Male and Female as a Theological Problem (Chap. 16); The Theological Dimension of Being Human (Chap. 17); The Shape of the Obedient Life, which deals with Israel's response to God in psalms, wisdom, and story (Chap. 18); Life under Threat (Chap. 19); and Life under Promise (Chap. 20).

From this outline it is apparent that Childs' way of doing OT theology represents no radical departure from the way others have done it. He emphasizes both constructive and descriptive dimensions of the task and orders his material in a conceptual and topical, rather than a historical or tradition-historical, manner. Even his vocal emphasis on a "canonical approach" represents no radical departure from past practices, for OT theology has traditionally accepted the canon of the OT as the source and norm which define its limits. It is true that Childs, more frequently than other scholars, makes the final or present shape of the canonical books the object of his theological reflections, rather than the antecedent stages or the process which led to their formation. But this fact is not sufficient to speak of a radical departure in biblical theology. (Hasel's handbook [1982: 86–92] needlessly multiplies labels and distinctions when it calls this the "New Biblical Theology Method." It is neither a new nor a distinct or well-defined method.) Childs' OT theology falls well within the limits of the fundamental dialectics described earlier, which have characterized the discipline for many years. His most recent work is another significant contribution to the field, but it blazes no new trails, nor does it resolve the fundamental problems and tensions which have beset the discipline in the past, and which will continue to beset it in the future.

Finally, Childs' claim that OT theology is a specifically Christian theological discipline makes only explicit what has historically been implicit in most OT theologies written by Christians. The validity or legitimacy of this claim is an issue which we shall not pursue at this point, but to which we shall return (see B.4 below).

k. S. Terrien. Terrien's volume (1978) is not so much an OT theology as it is a biblical theology, ranging across the theological content of both the OT and NT. However, since a major portion of its content deals with the OT, and since the OT provides the major overarching rubrics for dealing with the content of the NT, it is desirable to include this book under a discussion of recent OT theologies.

For Terrien, the reality of the presence of God stands at the center of biblical faith. This presence, however, is always elusive, so that one could equally well say that the dialectic between God's self-disclosure and self-concealment stands at the center of biblical faith. This theme, according to Terrien, is more fundamental and pervasive than the theme of covenant or any other center which has been proposed so far. Its pervasive presence can be demonstrated not only for the OT, but for the NT as well; hence it is ideally suited for the construction of a biblical theology which embraces both testaments.

In accordance with this overarching theme of God's elusive presence, a vast amount of biblical data is organized in ten succinct chapters. Chap. 1, "Cultus and Faith in Biblical Research," deals with some antecedent methodological issues. The author alludes to three revolutions in biblical studies (literary criticism, form criticism, and tradition history) and describes what he considers to be two dominant schools in OT studies: (1) the Scandinavian and British "myth and ritual" school, and (2) the German and Swiss "story of salvation" school. Terrien's own inquiry proposes to utilize the insights of both in the conviction that cultus and faith are integrally related and mutually interdependent in the Bible. The remainder of the first chapter is devoted to a brief discussion of the history and nature of biblical theology, as well as the author's own constructive proposals regarding it.

Chap. 2, "Epiphanic Visitations to the Patriarchs," traces the theme of divine presence through the ancestral narratives. These are understood as stories which preserve memories of moments when the Hebrew ancestors had perceived the presence of their God with particular intensity. Terrien maintains that the ancestral traditions differ from other theophanic traditions in the OT in that they are free from the display of natural mirabilia and are couched in the style of simple meetings, centering on dramatic dialogue between God and human beings. Several of the narratives of Genesis are examined in detail by the author with considerable exegetical skill and theological sensitivity.

In Chap. 3 Terrien turns to an examination of "The Sinai Theophanies." While the theophanic experiences ascribed to Moses bear some resemblance to the "epiphanic visitations" of the ancestors, they also differ from the latter in several respects: they ascribe the theophanies to a single place, the mountain of God; while the ancestors erected many altars at various sites, Moses created no topographically fixed shrine in the Wilderness of Sinai; they emphasize the element of natural wonder; and they are concerned with the theologoumenon of "the Name." In the disclosure of the latter, sight is submitted to hearing. Hebraism is a religion not so much of the eye as of the ear. The name carries connotations of divine presence, but it also confers upon this presence a quality of elusiveness. Terrien then goes on to contrast "name theology" with "*kābôd* theology," which are seen as the conflation of two distinct traditions, North and South. The former emphasizes the hearing of sounds and voices and the obeying of words, whereas the latter emphasizes visions of divine glory.

Chap. 4, "Presence in the Temple," deals with the theme of divine presence through sacred space, a notion deeply embedded in the human psyche. In Israel, however, there was a profound tension between two cultic views of divine presence: presence through space, and presence through time. This tension Terrien illustrates with reference to the changing roles of three cultic institutions: (1) the Ark of Yahweh, illustrating a move from historical time to cultic space; (2) the tent of meeting, which was a spatial vehicle for prophetic or oracular communication, to be distinguished from tabernacle and temple; and (3) the temple of Solomon, which Terrien interprets in the main as a reversion to NW Semitic paganism, with its omphalos myth and the triumph of the sense of seeing over the sense of hearing. Only in the Deuteronomistic reinterpretation of the name theology is the sense of hearing brought to the fore again. Further modifications were also effected by the prophetic critique of one-sided notions of divine presence in Israel; which brings the author to the subject of the next chapter.

Chap. 5 is devoted to "The Prophetic Vision." In keeping with Terrien's thematic and conceptual approach, the prophets are not dealt with individually and in chronological order, but as a single phenomenon under several theological rubrics. In distinction from other commonly held views, Terrien understands the prophets not primarily as predictors of the future, nor as announcers of the coming Messiah, nor even as social reformers, but as "poets of divine presence, even when they prayed to a deus absconditus" (1978: 227). In the traditions about Elijah, Terrien discerns a dramatic turning point in the

Hebraic theology of presence, insofar as it closed the era of theophany and relegated it to the realm of an unrepeatable past. In its place is ushered in the era of prophetic vision, "where miracles of nature become miracles of character" (1978: 229). Elijah's experience at Horeb demonstrates that "the God that is coming is altogether different from the one that man expects" (1978: 234). Elijah recognized the presence, but he did not see God. He only heard a voice, and it was the voice of commission. Elijah was not a new Moses, but the forerunner of an Amos. All the great prophets were confronted with the sudden discovery of presence, which they did not seek out, but to which they responded. Their burden was the burden of the word which had been forced upon them. It is to the intrusion of the divine presence in the word that their entire lives were subordinated. The prophets were intimate companions of God, but their companionship never deteriorated into casual familiarity. When Yahweh was silent, the prophet prayed, but he could not compel. The elusiveness of the divine presence gave birth to prophetic prayer and the poetry of spiritual agony. It also fulfilled a double function: it pointed to God's transcendent freedom over nature and humanity, but it also became a symbol of God's self-imposed weakness as a model for human power.

In Chap. 6, Terrien turns from the prophets to "The Psalmody of Presence." Several specific psalms are analyzed to demonstrate the manifold ways in which the theme of presence is developed. David himself, as reflected in Psalm 18, experienced divine presence as immediate and real and in terms of the liturgical anamnesis of the Sinai theophany, together with its implications of obedience and loyalty to the Mosaic covenant demands. For the Davidic successors, however, presence was conceived as an adoption into divine sonship, which was institutionalized in sacred ritual, as illustrated by Psalm 110. Terrien considers this to be a deterioration of the Hebraic theology of presence.

That the Lord of heaven and earth was present cultically in the sanctuary is the assumption of much of Israel's hymnology. But the psalms also attest a movement from cultic presence to spiritual presence, in the form of communion with Yahweh through faithful obedience far from the holy place (Psalms 27 and 84). The psalmists received through Zion a faith which taught them the superfluity of Zion. Some psalmists labored under the plight of their spiritual isolation; they sang of the absence or hiddenness of God (Psalm 22). Others spoke of the "haunting God," whose presence was experienced as oppressive (Psalm 139). And yet others spoke of the "sufficient God," whose presence could be experienced in situations of extremity (Psalm 23). Terrien sees the psalmody of presence evolving from royal communion to the inner life of the common person. Like the great prophets, the cultic musicians interiorized the cultus and thus helped to prepare the birth of Judaism after the destruction of the temple in 586 B.C.E.

In Chap. 7 Terrien turns to an analysis of "The Play of Wisdom." While the prophets compared communion between Yahweh and Israel to a marriage, and while the psalmists spoke of divine presence in terms of cultic nearness and mystical quest, the wise spoke of access to presence through the love of wisdom, which Terrien characterizes as a "man-initiated enterprise but in depth a human response to a transcendental call" (1978: 358). Wisdom could be likened to a sublime counterpart of the prostitutes in the mystery cults of the ancient Semitic world, who attempted to allure all who passed by. While for many of the wise presence was viewed as attainable, Job experienced God not only as absent or silent, but as an enemy whom he accused of malevolence and irresponsibility. Yet Job in turn encountered the holiness of God in its fullness, without intermediary or protective armor. Qoheleth pierces the traditional delusions of religionists. Seemingly skeptical, he nevertheless maintained a deep attachment to the theocentricity of all life. Terrien concludes this chapter with the claim that the sages exhibited the same theological rigor as the prophets, but they shifted their attention from history, a stage now devoid of God, to the theater of the universe where they detected divine presence. Terrien's claims for wisdom appear to be somewhat exaggerated, though he is to be commended for seeking to restore it to its rightful place within an OT theology.

Chap. 8, "The Final Epiphany," deals with postexilic Judaism. It is distinguished sharply from preexilic Hebraism as follows. Whereas Hebraism had been founded on divine presence, Judaism arose from divine absence. The parents had seen the mighty acts of God, but the children knew only national dereliction. Such generalized epitomes may strike the reader as a bit too glib and facile. God's presence continued to

manifest itself even in postexilic times. And this not only cultically, but now also in joyous meditation upon and faithful obedience to God's Torah, as well as through a life of prayer and mystic communion with one's Maker (see, e.g., Psalms 1 and 119).

More justified, perhaps, is Terrien's claim that there occurred in postexilic times a shift in emphasis from sacred space to sacred time. This thesis is undergirded with respect to three institutions which the author analyzes: The Sabbath, the Day of Atonement, and the Day of the Lord. In the Sabbath, ancient notions of sacrality are transferred from "holy space" to "holy time," as illustrated dramatically by the creation story in Genesis 1. Whereas ancient Semitic cosmogonies had concluded in the building of a temple, the priestly story of creation concludes with the consecration of the Sabbath. For Terrien, the Day of Atonement ritual exemplifies a theology of mediated presence through the agency of priest and temple, whereby the sins of the past were erased through the observance of the yearly ritual. Terrien, however, moves on shaky ground when he asserts that the atonement ceremony contains a "built-in element of amorality," because the collective aspect of forgiveness tends to dull the rigor of personal decision and behavioral commitment. Such value judgments appear ill-founded, especially when one compares the subsequent history of the Jewish and Christian communities.

The remaining two chapters of Terrien's theology are devoted to tracing the theme of divine presence into the NT. In Chap. 9, "Presence as the Word," Terrien argues that the theme of divine presence was of more fundamental importance to the early Christian interpretations of Jesus than the ideology of messianism. This is seen most clearly in three pivotal movements described in the Gospels: annunciation, transfiguration, and resurrection. Correlating the motifs of theophany, temple, and final epiphany, they interpreted the person of Jesus in the context of divine manifestation. These three stories as told in the four Gospels are subjected to a detailed exegesis by Terrien, and numerous parallels are drawn between elements in them and their OT antecedents. (That the NT picture of Jesus exhibits extensive affinities to Hebraic and Jewish antecedents comes as no surprise but a welcome confirmation to those who have never been persuaded by the Bultmannian construct of Jesus and of early Christianity.) In answer to the question why the early Church told the stories about the annunciation, transfiguration, and resurrection of an obscure Galilean executed for sedition by the Romans, Terrien replies quite simply that they saw that God was present in Jesus and that Jesus communicated divine presence to them. In his mortal existence, Jesus had brought God's nearness to people in need. In his eternal life, his presence enveloped them and created them anew.

Chap. 10, "The Name and the Glory," is devoted to the proposition that one of the dominant thought forms of the earliest methods of interpreting the person of Jesus was the temple ideology. The author seeks to demonstrate this thesis by looking at some key passages in Acts and the Epistles of Paul under the following three themes: (1) the New Temple; (2) the Temple of the Spirit; and (3) the Temple of his Body. Surprisingly, the author pays scant attention to the Epistle to the Hebrews, which is replete with temple ideology.

Obviously, Terrien's analysis of NT materials from the perspective of the theme of divine presence could have been even fuller. But by what he has done, the author has amply demonstrated that a biblical theology covering both testaments is a viable enterprise and one which could shed fresh light on the meaning and significance of the NT and of the Christian faith. Terrien's volume is a significant and masterful exemplar of the discipline of OT and biblical theology. Thoroughly grounded in the detailed exegesis of numerous texts, it includes a wealth of information exhibiting broad mastery of the field and relevant literature. His documentation from both primary and secondary sources is thorough and comprehensive. The book is also lucidly and interestingly written. Even where one disagrees with viewpoints advanced by the author, one still finds oneself stimulated by him. The understanding of the discipline of OT theology reflected in his work is both descriptive and normative. It goes further than most recent OT theologies in being theologically normative. The author's overarching methodology is conceptual and thematic, although historical and tradition-historical perspectives are not entirely ignored. The center of his theology is the dialectal theme of God's presence and absence, or self-disclosure and self-concealment. Associated with it are a number of subordinate dialectal themes, such as eye and ear,

hearing and seeing, glory and name, aesthetic and ethical, and the like. By means of these, he is able to bring into correlation a mass of biblical data, including such diverse and frequently neglected materials as wisdom and cultic piety. It is not necessary to agree with the author that the theme of divine presence is the only one, or even the most viable one, for doing biblical theology. Other themes and conceptual constructs may be used to correlate significant amounts of biblical data, as an examination of one final biblical theology will demonstrate.

l. P. D. Hanson. Like Terrien's theology, Hanson's (1986) is a biblical theology that ranges across the content of both testaments, and that draws major overarching concepts from theOT. The purpose of Hanson's biblical theology is clearly stated in its preface. He does not seek to present a new biblical theology on the scale of Eichrodt or von Rad. Instead, he proposes to follow one fundamental theme which he sees running as a unifying thread through all the diverse writings of the Bible. On the other hand, he proposes to transcend the limitations of Eichrodt and von Rad in two important ways: first, by concentrating not solely on the historical and prophetic traditions, but by dealing with all major biblical traditions, including priestly, sapiential, and apocalyptic ones; and second, by going beyond the OT into the NT.

As regards the book's design, an appendix and the first chapter are devoted to a discussion of the underlying presuppositions and methodology of the author. Hanson's approach to the subject is avowedly descriptive and normative. Constructive theological reflections are interspersed with rigorous historical, sociological, and philological analysis. The remaining 14 chapters of the book cover various biblical periods in historical sequence, including the intertestamental and NT periods. Relevant biblical literature is assigned to and discussed against the background of a brief historical sketch of each period, which is prefixed at the head of each chapter. So rigorous is this historical and sequential approach to the subject that in large stretches the book is indistinguishable from a history of the religion of Israel. Nevertheless, the construct of an overarching normative theme against which the various religious ideas and institutions of each period are measured, as well as the presence of constructive theological reflections and applications, places this book squarely within the category of OT theology as we have defined it. Hanson's book, however, is a vivid reminder of how closely related and interdependent these two sister disciplines have become in recent decades.

The unifying theme or center of Hanson's biblical theology is the biblical notion of community. Born in the experience of the Exodus, this notion is based on a pattern of divine initiative and human response. To the antecedent acts of a righteous and compassionate God, Israel responded in grateful worship and praise. The Yahwistic notion of community centered on devotion to one God alone and was defined by a triad of qualities: righteousness, compassion, and worship. This triadic notion of community, unlike the one which it challenged, did not offer a finished program, but rather inaugurated a historical process. It is to a description of this historical process that the successive chapters of Hanson's book are devoted.

The Yahwistic notion of community grew during the era of the tribal league. It was tested and refined during the age of kings and prophets. Kingship with its Davidic covenant theme and Zion tradition affected it both positively and negatively. But it was especially through prophecy that the Yahwistic notion of community was preserved and developed. Amos and Hosea envisaged a reformulation of the community of faith. Isaiah effected a masterful synthesis between the early Yahwistic notion of community and the Jerusalem royal theology; at the time the latter was thoroughly eschatologized. Micah represents one of the sharpest attacks on the Zion tradition in the name of the covenant theology of early Yahwism; and Jeremiah stands as a monumental example of the tenacity of the latter. He saw more clearly than anyone before him that the chief obstacle to true community lay deep within the human heart, requiring a new redemptive act by God. In spite of the sincere reform efforts by kings like Hezekiah and Josiah, the monarchic experiment ended in failure. Out of this crisis, new attempts at reformulating the Yahwistic notion of community were made. Ezekiel envisaged a program for the restoration of purity through the sanctuary and the cult. The Priestly writing also envisaged a return to fundamental structures of worship established in a bygone era. It stressed the atonement ritual provided by God as a means of overcoming sin and alienation from God. The emphasis on strict division between priests and Levites and

the stress on the definitive nature of Torah as an eternal order ordained by God on Sinai sowed the seeds of subsequent strife between various segments of the postexilic community. Second Isaiah's was the most remarkable response arising out of the Exile. The era of punishment for sin was ended; a new era of salvation was about to be ushered in by God. In the figure of the servant, he announced a broadened and deepened understanding of community. It included not only Israel but the nations of the world and was rooted in the mystery of God's redeeming action in one who suffered the fate of the accursed, but who through his vicarious sacrifice was gathering together a community of the forgiven and redeemed by God.

In contrast to Second Isaiah's lofty vision, the early postexilic community was characterized by party strife and dissension. Leadership was held firmly in the hands of the Zadokite party, with its pragmatic program of domestic consolidation around a hierarchically stratified cult. It received support and new impetus from prophets like Haggai and Zechariah, as well as from circles responsible for an early edition of Chronicles. Dissident groups gave rise to apocalyptic eschatology, represented by such texts as Ezekiel 38–39, Isaiah 24–27, and Zechariah 10–14. The book of Malachi, as well as the editorial framework of Third Isaiah, represents a protest against conditions in the divided community of the 5th century. Hanson ventures the judgment that the Yahwistic notion of community during this period was perhaps better understood by those who lost the struggle for preeminence than by the Zadokite establishment which won, a reminder that faithfulness to a biblical ideal is not necessarily associated with the religious establishment of a given era.

The threat of the dissolution of the Yahwistic community during the 5th century was avoided through the successful reforms of Ezra and Nehemiah. Their contribution is evaluated positively by Hanson as providing the concrete communal structures capable of regulating a society and maintaining a just order, without which the high ideals of the Yahwistic community of faith might not have been preserved. At the same time it must also be noted, however, that their tendency to identify righteousness too closely with a narrow partisan view of community muted earlier prophetic understanding of God's compassionate and all-inclusive outreach. Such attempts to scale back the eschatological dimension of Yahwistic faith by focusing too exclusively on the "holy seed" of Judah did not go unchallenged. Voices of protest against them were raised in such writings as Joel, Ruth, and Jonah.
